RP319

INDEX

AARONS, Dr J., and others : Correlation of Audio-Frequency Electromagnetic Radiation with Auroral Zone Micropulsations, 148
  Observations on the Solar Eclipse of October 2, 230
Abbreviated Development in a Pinnotherid Crab (Dr I Goodbody), 704
Abd-el-Malek, Prof. Y., and Rizk, S. G. : Culture of *Desulphovibrio desulphuricans*, 635
Abel, J E , and others : Products of Decomposition of Lead Azide, 456
Ability of Isolated Rat Diaphragm to Incorporate Labelled Amino-Acids into its Protein : Effects of Starvation on the, and to Respond to the Influence of Insulin on this Process (Dr K. L Manchester), 907
Abnormal Growth and Development in Pea resulting from Exposure to Adverse Conditions during Germination (Alex M M Berrie), 626
Abnormal Haemoglobins in Portuguese Guinea : A Survey of (Prof. Carlos Trincao, L. T de Almeida Franco and Alfredo R Nogueira), 326
Abnormalities in the Urinogenital System of the Common Dogfish (Dr. A S. Fuller and J. M. Zacharov), 50
Abnormality (Arm), in *Octopus* (Herman E. Kumpf), 334
Aborigine (Australian) Plasma Antihaemophilic-Factor Concentrations in the, and in Conditions associated with Hyperglobulinaemia (W. R Pitney and M. H. Elliott), 397
Absence of the Diego Blood-Group Antigen in the Lapps (Dr Leif Kornstad), 325
Absorption of Light behind the Detonation Front Emission and (Prof C. H. Johansson and T. Sjolin), 523
Absorption by Plant Roots : Calcium–Lithium Competition in (Emanuel Epstein), 705
Absorption (Electron Spin Resonance), of the Biradical Molecular Complex, *p*-Phenylenediamine-chloranil (Dr. Y Matsunaga and Prof. C. A McDowell), 916
Absorption (Intestinal) : Reduction of, by a Synthetic Chemical (Dr. J A. Nissim), 222
Absorption Analysis (Infra-Red) Determination of Tetrahedral Aluminium in Mica by (Dr. R. J. P. Lyon and Dr. W. M. Tuddenham), 374
Absorption Spectroscopy : Some Atomic Reactions by (Dr. H. P. Broida, Dr. H. I. Schiff and Dr. T J. Sugden), 759
Absorption and Dispersion of Ultrasonic Waves (Karl F Herzfeld and Theodore A. Litovitz), *review* by Prof E. G Richardson, 3
Absorption–Elution Grouping of Dried Blood Smears (S. S. Kind), 397
Academic Careers of Entry of 1955 (University of Cambridge Sociological Society), 218
Academic Freedom and University Standards, 795
Academic Origins : University Students and their (R. K. Kelsall), 218
Academic Performance : An Audit of—a Study of the Prediction of Academic Success in the Queen's University of Belfast (Michael Forster), 218
Academic Success in the Queen's University of Belfast . An Audit of Academic Performance—a Study of the Prediction of (Michael Forster), 218
Academy of Sciences of the U.S.S.R To join the International Federation of Computer Societies, 507
Accessibility of Cellulose : Deuterium–Hydrogen Exchange between Water and Macromolecules— (Dr John R. Morrison), 160
Accumulation of Caesium-137 by Plants grown in Simulated Pond, Wet Meadow and Irrigated Field Environments (Dr. R. C Pendleton and Dr. R. L. Uhler), 707
Acellular Slime-mould : A Mating-type System in an (Jennifer Dee), 780
Acetabularia and *Halicoryne* (*Codium*,) : Chemical Nature of the Cell Wall of the Green Algae (Yoshihiko Iriki and Tomoo Miwa), 178
Acetate Oxidation by *Saccharomyces cerevisiae* var *ellipsoideus* . Influence of Sorbic Acid on (Prof Norberto J. Palleroni and Maria J. R de Pritz), 688
Acetic Acid (Indole) : Differentiation induced as Season Advances in the Embryo-Gametophyte Complex of *Pinus nigra* var. *austriaca*, using (Prof. Norman W Radforth and Dr J. M Bonga), 332
Acetic Acid (Indole), and Maleic Hydrazide Certain Mitotic Effects of Kinetin, Gibberellic Acid, on the Root of *Allium cepa* (M. Annunciata McManus), 44
Acetic and Picric Acids (Glacial), as a Fixation for Gel Precipitation (Dr. Bengt Bergrahm), 242
Acetobacter aceti: Activity of a Substance extracted from the Fermentation Products of, on Ehrlich's Ascites Tumour Cells (G. A. Lanzani and A Pecile), 175
Acetobacter xylinum : Transglucosidase Activity in (Sigrid Klungsoyr), 104
Acetylcholine : Is there a Leakage of ?, from Postganglionic Parasympathetic Nerve Endings (Prof. N. Emmelin), 297
Acid and Alkali (Water,) Dissolution of Chrysotile Asbestos in (S G. Clark and Dr. P. F. Holt), 237
Acid Phosphatase : Inactivation of, in Human Prostatic Homogenates *in vitro*—Role of Calcium (Prof H. J Tagnon and A. Steens-Lievens), 48
Acidic Carbohydrates . Paper Chromatography of (Dr. David A. Rees), 309
Acids (Strong), and Water : Ionic Hydration in Mixtures of (Erik Hogfeldt), 760
Acland, J. D. : Scoring of a 'Steadiness' Test, 337
Acorus calamus L. of Indian Origin Separation of the Hypnotic Potentiating Principles from the Essential Oil of, by Liquid–Gas Chromatography (Ross M. Baxter, P. C Dandiya, S. I Kandel, A Okany and Prof. G. C. Walker), 466
Acquired Haemolytic Anaemia : Individual Specific Nature of the Cold Auto-Antibodies of (Dr. T. N Mehrotra), 323
Actinomycins and their Importance in the Treatment of Tumours in Animals and Man (New York Academy of Sciences Conference on), 76
Action of Antibodies and Plasmin on Ehrlich Ascites Tumour Cells (Dr I Ginsburg and M. Ram), 328
Action of Hair-loosening Organisms : Mode of (Dr. K J Whiteley), 781
Action of Thyroxine on the Rate of Oxygen Consumption of the Lung-Fish (*Protopterus*), (Dr. T. Mohsen and Dr R Godet), 108
Action of Thyroxine Analogues on Frog Melanocytes (Dr M. Ruth Wright and Dr. Aaron B Lerner), 169
Action (Chemical and Biological), of Radiations, *review* by Dr W. Anderson, 202
Action (God's) in a World governed by Scientific Law Chance and Providence— (Dr. William G Pollard), *review* by the Rev. Dr. E. L Mascall, 875
Action (Mutagenic), of Mitomycin C on *Escherichia coli* (Teiji Iijima and Atsuyoshi Hagiwara), 395
Actions Chimiques et Biologiques des Radiations (Collection dirigée par M Haissinsky), Troisième Série, Radiolyse de Liquides organiques (Milton Burton), Polymérisations amorcées par les Radiations ionisantes (A. Chapiro et M Magat), Effets des Rayonnements de grande énergie sur les Polymères (A Charlesby) , Quatrième Série, Les Peroxydes organiques en Radiobiologie (R Latarjet et *al*), *review* by Dr. W Anderson, 202
Actions (Inhibitory), of γ-Aminobutyrylcholine (M. Asano, T Noro and K. Kuriaki), 848
Activated Gases : Sorption of, by Titanium Films (L. Holland), 911
Activating and Fluorescent Wave-lengths of Furocoumarins—Psoralens (Dr. M. A. Pathak and Prof J. H. Fellman), 382
Activation of Plasminogen by Staphylokinase (Dr Flora M Davidson), 626
Activation (Periodic) : Dependence of, and Inhibition of Monoaminoxidase by Aliphatic Compounds upon Chain-length (Dr George C. Cotzias and Dr James J Greenough), 384
Activation Analysis (Neutron), of Ancient Roman Potsherds (V M. Emeleus and G. Simpson), 196
Activation Sequence (Prothrombin) : Significance of Thrombin E in the (Dr. Walter H. Seegers, Dr Ricardo H. Landaburu and Dr. J. Frederic Johnson), 930
Activities (Anti-Bacterial) Synthetic Polypeptide Derivatives with (Dr. K Kovács, Dr A Kótai and Dr. I Szabó), 266
Activities (Anti-Tumour), of Copper Chelates (Dr. Kazuhiko Takamiya), 190
Activities (Tissue Enzyme) . Effects of the Method of Tissue Preparation on the Assay of (Dr. Sjoerd Bonting and Ira M. Rosenthal), 686
Activity . Atmospheric Radiocarbon, in 1959 (Dr. E H Willis), 552
Activity of Plasma Enzymes in the Rabbit : Effect of Salicylate on the (I Janota, C. W Wincey, M. Sandiford and Dr M. J. H. Smith), 935
Activity of a Substance extracted from the Fermentation Products of *Acetobacter aceti* on Ehrlich's Ascites Tumour Cells (G. A Lanzani and A. Pecile), 175
Activity (Aminopeptidase) : Histochemical Evidence of, in Rat Pineal Gland (Dr. Mikko Niemi and M. Ikonen), 928
Activity (Anticholinergic), of Tropine-α-Methyltropate (G. Maffii and G. Bianchi), 844
Activity (Comparative Adenylic Acid Deaminase), in Choroid Plexus and Ciliary Process Tissue (Prof Morton B. Waitzman), 388
Activity (Cyclical), in Endocrine Systems (Zoological Society of London Symposium on), 663
Activity (Fibrinolytic), of Cirrhotic Liver (Dr. Tage Astrup, J. Rasmussen, A Amery and H. E Poulsen), 619
Activity (Hepatotoxic), of Semi-Synthetic Analogues of Pyrrolizidine Alkaloids (Dr R. Schoental and Dr. A. R. Mattocks), 842
Activity (Muscle Cholinesterase) : Effect of Testosterone Propionate and Insulin on (A N. Granitsas, N. Dede and Dr. A. J. Philippu), 320
Activity (Oxidase), in the Mitochondria of the Heart in some Lower Vertebrates : Histochemical Localization of (Prof A Stolk), 866
Activity (Pancreatic), of Guinea Pigs and Rats Effect of β-Hydroxybutyrate Injections on the (Prof A Schwartz, J Manta, J Madar and Z. Kis), 771
Activity (Phagocytic), of the Reticulo-Endothelial System : Minimum Dose of Diethylstilboestrol required to Stimulate the (Prof T Nicol and C. C. Ware), 42
Activity (Succinic Dehydrogenase), in Osteoclasts : Histochemical Demonstration of (Dr M. S Burstone), 866
Activity (Transglucosidase), in *Acetobacter xylinium* (Sigrid Klungsoyr), 104
Activity (Tryptophanase) : Effect of Sulphydryl Group Reagents on (J. M. Turner and Prof Frank C Happold), 763
Activity Tracer Studies (High Specific) : A Pitfall in (Dr. E Hell, Dr R. J Berry and Dr. L. J Lajtha), 47
Acute Effects of Radiation : Protection against, by Hypoxia (Dr Patricia J Lindop and Prof. J Rotblat), 593
Adam, Avinoam, and others : Erythrocyte Glucose-6-Phosphate Dehydrogenase-deficient Subjects—Enzyme-Level in Saliva, 931
Adams, E P., and others : Carnitine in Lipid Metabolism, 612
Adams, J. B. : The CERN Proton Synchrotron, 568
Adams, Dr Mark H. : Bacteriophages, *review* by Dr B Stocker, 276
Adamson, R S : The Biology of the Southern Cold Temperate Zone, 206
Adaptation (Human), to Cold (Dr. Laurence Irving), 572
Adenosine Phosphates and 5'-Adenylmethylenediphosphonic Acid, an Analogue of Adenosine Triphosphate : Vasodepressor Effect of (James W Flesher, Dr. Y T. Oester and T. C. Myers), 772

Adenosine Triphosphate : Vasodepressor Effect of Adenosine Phosphates and 5'-Adenylmethylenediphosphonic Acid, an Analogue of (James W. Flesher, Dr. Y. T. Oester and T. C. Myers), 772
Adenylic Acid Deaminase Activity (Comparative), in Choroid Plexus and Ciliary Process Tissue (Prof. Morton B. Waitzman), 388
5'-Adenylmethylenediphosphonic Acid, an Analogue of Adenosine Triphosphate : Vasodepressor Effect of Adenosine Phosphates and (James W. Flesher, Dr. Y. T Oester and T. C. Myers), 772
Adie, R. J. : Awarded the Mrs Patrick Ness Award of the Royal Geographical Society, 735
Adipose Tissue Lipoprotein Lipase : Significance of (Dr J Páv and Dr. J Wenkeová), 926
Administration of Corticosteroids . Correlation between the Electrolyte and Water Content of the Organs and Hypertension after (Prof L. Laszt), 695
Administration of Universities (Prof. C. Northcote Parkinson), 816
Administration (Maritime), and others . . Conference on the Role of Nuclear Propulsion in our Future Merchant Marine, 582
Adrenaline and Insulin : Effect of, upon the Oxygen Consumption of Hyperthyroid Rats (R L. Himsworth), 694
Adrenergic Neurone-blocking Agents (Powerful), related by Choline 2,6-Xylyl Ether Bromide (A. L A. Boura, G G Coker, F C. Copp, W. G. Duncombe, A R Elphick, A. F. Green and A. McCoubrey), 925
Adrenocortical Function after Prolonged Salt Restriction in Hypertension (Dr. Lewis K. Dahl, Dr. Lawrence Silver, Dr. Robert W. Christie and Dr Jacques Geneat), 110
Adsorption · Substitution Reactions of Cobaltic Complexes catalysed by (A A Vlček and K Kuta), 95
Adult Fowl Leucocytes . Chorioallantoic Membrane Lesions produced by Inoculation of (Dr. Georgiana Boyer), 327
Adult Haemoglobin (Foetal and) . *In vitro* Synthesis of, by Foetal Haematopoietic Tissues (Dr E Donnall Thomas, Harry L Lochte, jun , William B. Greenough, III., and Marion Wales), 396
Adult Sheep Formation of New Wool Follicles in the (A. H Brook, B F. Short and A G. Lyne), 51
Advanced Technology · Courses in (London and Home Counties Regional Advisory Council for Technological Education Bulletin on), 506
Advances in Applied Microbiology (edited by Wayne W. Umbreit), Vol 1, *review* by Dr. J. W. G. Porter, 565
Advances in Astronautical Sciences . Vol. 1, Proceedings of the Third Annual Meeting of the American Astronautical Society, 1956 ; Vol. 2, Proceedings of the Fourth Annual Meeting, 1957 , Vol. 3, Proceedings of the Western Regional Meeting, 1958, Vol. 4, Proceedings of the Fifth Annual Meeting, 1958, *review* by F. G. Irving and J L Stollery, 798
Advances in Atmospheric Electricity Recent—Proceedings of the Second Conference on Atmospheric Electricity, Portsmouth, New Hampshire, 1958 (edited by L G Smith), *review* by Dr F. J. Scrase, 131
Advances in Petroleum Chemistry and Refining (edited by Kenneth A. Kobe and John J. McKetta, Jr), *review* by Prof. F Morton, 201
Adverse Conditions during Germination · Abnormal Growth and Development in Pea resulting from Exposure to (Alex. M M Berrie), 626
Advisory Council (Central), for Education (England) 15 to 18, a Report of the, Vol 1, Report (Ministry of Education), 341, 873
Aerodynamic Capture of Particles (British Coal Utilization Research Association Symposium on) 664
Affection (Renal), resulting from Blood Trauma in Extracorporeal Circuits (Dr. H. S. S. Sarajas and Dr. L Saure), 768
Africa : Agriculture and Ecology in (Prof John Phillips), *review* by Dr Kenneth Mellanby, 564
  Conservation in America and, *review* by Prof L Dudley Stamp, 345
  The Dark Age In, *review* by M. C. Burkitt, 645
  School Children in, 658
Africa (Central) : University Education in (Prof. F G Young), 816
Africa (Old) Rediscovered (Basil Davidson), *review* by M C Burkitt, 645
Africa (South), and Commonwealth Fellowships, 893
African Wild Animals · Control of (Dr H K Buechner, Dr A. M. Harthoorn and Dr. J. A. Lock), 47
Agar, Dr. J. N. · Solutions of Electrolytes, *review*, 274
Agar Cultures (Serum), of Bone Marrow Flecks : Effect of Amethopterin and 6-Mercaptopurine on the Pattern of Oxygen Tension Measurements in the Fluid Phase of (Dr H J Woodliff and J. M G. Davis), 477
Agarwala, Dr R. P. : Awarded the first Research grant under the Exchange and Training Programme of the International Atomic Energy Agency, 354
Agate, Dr. John · Vibrations (Influence of Vibrations in Industry on the Hands of Operating Personnel), 899
Age . Effect of, on the Heparin Content of Rat Skin (Dr Sara Schiller and Dr Albert Dorfman), 111
Age (The Dark), in Africa, *review* by M C Nurkitt, 645
Age (Physiological), of Codling Moth Females (*Cydia pomonella* L) caught in Bait and Light Traps (P. W Geier), 709
Age Differences in Movement Pattern (K. F. H Murrell and D G Entwistle), 948
Age-hardening Alloys · Influence of Guinier–Preston Zones on the Electrical Resistivity of (C. W. Morley and B D Burns), 914
Ageing · Periosteal Osteoclasts, Skeletal Development and (Dr. E A. Tonna), 405
Ager, Dr D. V. Awarded the Murchison Fund of the Geological Society of London, 657
Ages (Cosmic-Ray) : Calculation of, in the Iron Meteorites 'Carbo' and 'Treysa' (Dr H. Voshage and Dr H. Hintenberger), 88 , (Dr Royal R. Marshall), 89
Ages (Middle) . The Science of Mechanics in the (Marshall Clagett), review by Prof E J Dijksterhuis, 491
Ages (Potassium–Argon and Rubidium–Strontium), of some Granites from Britain and Eire (Prof J L Kulp, Dr. L E. Long, C. E. Giffin, Dr A. A. Mills, Dr R StJ. Lambert, Dr. B J. Giletti and Dr R K Webster), 495
Agglutination (Red Cell), by Stromal Material in Haemolysates (S. B de C. Baker), 547
Aggregation and Staining Behaviour of Ultra-Violet Irradiated Films of Nucleic Acids (Prof. D. Shugar and Dr J Baranowska), 33
Agricultural Advisory Service (National) Retirement of W Morley Davies as senior advisory officer, 504
  Appointment of Dr. N. H. Pizer as senior advisory officer, 504
Agricultural Botany, National Institute of Appointment of G W. G. Briggs as assistant director, 430
Agricultural College of the University of Ghent · Twelfth International Symposium on Crop Protection, 286
Agricultural History Society (British) : Eighth Conference, 893
Agricultural Meteorology Third Symposium on Aspects of (Upland Climate and Land Usage, with special reference to Highland Britain), (University College, Aberystwyth), 737
Agricultural Research in India, *review* by Colin Clark, 414
Agricultural Research, Indian Council of (Unesco and the) Symposium on Algology, 820
Agricultural Research Council : Retirement of Sir William Slater from the secretaryship, 144
  Appointment of Prof E G Cox as secretary, 144
  Income from the patents on Prof. R. L Wain's discoveries in the field of selective herbicides made available to the, 893
Agricultural and Horticultural Research Station (the National Fruit and Cider Institute), Long Ashton, Bristol · Annual Report for 1958, 743
Agriculture and Animal Husbandry in India (Dr. M. S. Randhawa), *review* by Colin Clark, 414
Agriculture and Ecology in Africa (Prof John Phillips), *review* by Dr. Kenneth Mellanby, 564
Agriculture, Fisheries and Food, Minister of : To set up a Working Party on Horticultural Co-operative Marketing Societies, 736
Agriculture, Fisheries and Food, Minister of, with the Minister for Science, the Secretary of State for Scotland and the Minister of Health . Appointment of a Research Study Group to consider the Use of Toxic Chemicals in Agriculture and Food Storage, 578
Agriculture, Fisheries and Food, Ministry of · Appointment of P. N. Harvey as farm director at Gleadthorpe Experimental Husbandry Farm, 146
  Fishery Investigations, Series 2, Vol. 22, No. 6, On the Nature of Production in the Sea (Dr. D. H. Cushing), 218
Agriculture and Food Storage Use of Toxic Chemicals in (Appointment by the Minister of Agriculture, Fisheries and Food, with the Minister for Science, the Secretary of State for Scotland and the Minister of Health of a Research Study Group to consider the), 578
Agriculture and Horticulture · Fungicides in (Pesticides Group of the Society of Chemical Industry Symposium on), 507
Agriolimax reticulatus (The Field-Slug), as a Vector of the Lungworm *Cystocaulus ocreatus* (Dr J H Rose), 180
Aid (State), for Museums and Art Galleries of Britain, 890
Ainsworth, Dr. G C , and Austwick, P K. C. . Fungal Diseases of Animals, *review* by J E Smith, 720
Air Ministry Scales of Temperature in the Meteorological Office, 736
  High-Atmosphere Research in the Meteorological Office, 814
  Gassiot Research Fellowships in Geomagnetism and Seismology (Meteorological Office), 892
Air-breathing Machines . High Mach Number (Combustion and Propulsion Panel of the Advisory Group for Aeronautical Research and Development of NATO, Colloquium on), 146
Aitken, Dr. R S. Appointed a member of the Commonwealth Scholarship Committee in the United Kingdom, 505
Albatross (Wandering), *Diomedea exulans* Linnaeus : Chick Feeding in the (W L N Tickell), 116
Albertsson, Per-Åke, and Philipson, Lennart Antigen–Antibody in Liquid Two-Phase Systems—a Method for Studying Immunological Reactions, 38
Albinism in *Cryptomys hottentotus* Lesson, 1826 (Peter St J Turnbull-Kemp), 555
Albino Rats The Shuttle-Box Behaviour of, during Prolonged Exposure to Moderate-Level Radiation (Dr. John E Overall, Dr. W Lynn Brown and Dr Loren C Logie), 665
Alcohol : Effect of Small Doses of, on a Skill resembling Driving (Prof G. C Drew, W P Colquhoun and Hazel A. Long), 354
Alcohol and Road Safety, 354
Alderson, Dr Thomas Significance of Ribonucleic Acid in the Mechanism of Formaldehyde-induced Mutagenesis, 904
Aldosterone-stimulating Hormone in Urine · Presence of (Dr. E. J Ross, E K. McLean and G. R Miller), 540
Alexander, G , and Brook, A H Loss of Heat by Evaporation in Young Lambs, 770
Alexander, Dr. P , and Moroson, Dr. H. . Effect of Ultra-Violet Light on the Shape and Size of Deoxyribonucleic Acid, 678
Alfred, Lawrence J , and others Multiplication of Vaccinia Virus in Serum-free and Serum-containing Cell Cultures, 123
Algae · New Delhi Symposium on (Dr G. E Fogg), 820
  Resistance of, to Radiation (Dr. M. B E. Godward), 706
  A Reversible Inhibition of Photosynthesis in Synchronized Cultures of (Dr. Constantine Sorokin), 933
Algae (Green), *Codium*, *Acetabularia* and *Halicoryne* Chemical Nature of the Cell Wall of the (Yoshihiko Iriki and Tomoo Miwa), 178
Algae (Soil) Rhizosphere Effect on (W. Hadfield), 179
Algal Culture Media and Sea Water: Volatile Organic Matter in (F. A J Armstrong and G. T Boalch), 761
Algology (Unesco and the Indian Council of Agricultural Research Symposium on), 820
Aliev, G Protection of Nature in the Soviet Republic of Azerbaijan, 580
Aliphatic Compounds . Dependence of Periodic Activation of Inhibition of Monoaminoxidase by, upon Chain-length (Dr George C Cotzias and Dr James J. Greenough), 384
Alkali (Water, Acid and) . Dissolution of Chrysotile Asbestos in (S. G. Clark and Dr P. F. Holt), 237
Alkali-dissociated Haemoglobin Mixtures Asymmetrical Recombination of (Dr Elizabeth Robinson and Dr Harvey A. Itano), 547
Alkaloids (Ergot) : Biosynthesis of (Ross M. Baxter, S. I. Kandel and A. Okany), 241
Alkaloids (Pyrrolizidine): Heptatotoxic Activity of Semi-Synthetic Analogues of (Dr. R Schoental and Dr A R Mattocks), 842
All-India Congress of Zoology (Zoological Society of India), 285
  Presidential Address (Dr M. L. Roonwal), 285
Allan, J H. · Birefringence of Enamel Organic Matrix, 402
Allaway, P. H. · Vibrations (Problems of the Vibration Isolation of Machinery), 899
Alleged Formation of an Intermediate Diamond Structure on Heating Diamond (Dr. F. A. Raal), 523

INDEX

Allen, Dr J. A . Manganese Deposition on the Shells of Living Molluscs, 336
Allen, Prof J F. : Film Transfer in He II, 831
Allen, Prof R. G. D. : Market Strategy and Economic Survival, *review*, 645
Allium cepa . Certain Mitotic Effects of Kinetin, Gibberellic Acid, Indoleacetic Acid and Maleic Hydrazide on the Root of (M. Annunciata McManus), 44
Alloy (Copper–Indium Eutectoid) · Decomposition of the Beta-Phase in a (D A Moore, M White and Dr D R F. West), 454
Alloys (Age-hardening) · Influence of Guinier–Preston Zones on the Electrical Resistivity of (C. W Morley and B D Burns), 914
Alloys (Light), in Structural Engineering Research Scholarship in the Use of (Institution of Structural Engineers and the Aluminium Development Association), 356
Alloys (Titanium–Iron) · Oxidation of (J Stringer, M G Cowgill and N C Griffiths), 304
α-Ferric Oxide : Neutron Diffraction Study of Antiferromagnetic Spin Waves in (J. A. Goedkoop and T. Riste), 450
α-Fluoroaconitate Triethyl (Ernst D. Bergmann and I. Shahak), 529
α-Keratin Meridional Reflexions in the X-Ray Diffraction Photographs of (W. J. Onions, H J Woods and P B Woods), 157
α-Ketoglutaric and Pyruvic Acid in Man Clearances of Endogenous (Dr Eman Zelníček), 928
α- and β-Forms of Calcium Sulphate Hemihydrate (D A Powell), 375
α,ε-Diaminopimelic Acid—its Distribution, Synthesis and Metabolism (Dr. L. E. Rhuland), 224
Alternative Interpretation of the Supposed Giant Deciduous Hominid Tooth from Olduvai (Dr. J. T. Robinson), 407 , (Dr L S B Leakey), 408
Alternative Mechanism for Chemical Protection against Radiation Damage (Prof. Mark M. Jones), 96
Altman, Kurt I., and others : Some Inter-related Aspects of Proline and Hydroxyproline Metabolism, 767
Aluminium (Tetrahedral), in Mica Determination of, by Infra-Red Absorption Analysis (Dr. R. J P Lyon and Dr W. M. Tuddenham), 374
Aluminium Development Association (Institution of Structural Engineers and the) . Research Scholarship in the Use of Light Alloys in Structural Engineering, 356
Ambartsumian, Prof. V. A. · Awarded the Gold Medal of the Royal Astronomical Society, 144
Ambrosen, J. Time of Residence of Radioactive Debris in the Stratosphere, 301
Amelinckx, S , and Delavignette, P · Observation of Dislocations in Non-metallic Layer Structures, 603
Amenities of Great Britain : Preserving the, 580
America : Tropical Marine Molluscs from, *review* by I C. J Galbraith, 275
America (Tropical West) · Sea Shells of (Prof. A. Myra Keen), *review* by I C. J Galbraith, 275
America (Western North) : The Zoogeography of, *review*, 800
America and Africa Conservation in, *review* by Prof. L. Dudley Stamp, 345
American Academy of Arts and Sciences Monograph Prize of 1959 awarded to Prof W. Munk and Dr G. J. F. MacDonald's book 'The Rotation of the Earth', 660
American Association for the Advancement of Science . Publication No. 51, Symposium on Zoogeography, Indianapolis, 1957 (edited by Carl L. Hubbs), *review*, 800
American Association for the Advancement of Science, and others : Symposium on Basic Research (edited by Dael Wolfle), 716
American Association for the Advancement of Science (Pacific Division), (American Institute of Biological Sciences and the) · Symposium on Zoogeography, Stanford University, 1957 (edited by Carl L Hubbs), *review*, 800
American Astronautical Soceity . Advances in Astronautical Sciences, Vol. I, Proceedings of the Third Annual Meeting, 1956 , Vol. 2, Proceedings of the Fourth Annual Meeting ; Vol. 3, Proceedings of the Western Regional Meeting, 1958 , Vol 4, Proceedings of the Fifth Annual Meeting, 1958, *review* by F G Irving and J. L. Stollery, 798
American Chemical Society . Monograph Series No. 137, The Physical Chemistry of Electrolytic Solutions (Prof. Herbert S Harned and Prof Benton B. Owen), third edition, *review* by Dr. J N Agar, 274
American Chemical Society (Fermentation Subdivision), and others : International Symposium on Fermentation, 14
American Cockroach, *Periplaneta americana* L. : Spectrophotometric Measurement of Cytochromes in the Red and the White Muscles of the (Tsutomu Nakatsugawa), 85
American Ethnology, Bureau of (Smithsonian Institution) : Publication of the Index to the 'Handbook of South American Indians', 815
American Geographical Society . David Livingstone Centenary Medal awarded to William E. Rudolph, 12
  Cullum Geographical Medal awarded to Dr Albert P Crary, 12
  Daly Medal awarded to Dr. Richard Hartshorne, 12
American Geophysical Union of the United States National Academy of Sciences Formation of a Planning Committee on Planetary Sciences, 658
American Industry : Scientists and Engineers in (United States National Science Foundation), 213
American Institute of Biological Sciences and the Pacific Division of the American Association for the Advancement of Science : Symposium on Zoogeography, Stanford University, 1957 (edited by Carl L. Hubbs), *review*, 800
American Mathematical Society : Symposium on Stability Problems in Hydrodynamics, 215
American Mathematical Society and the Association for Symbolic Logic Symposium on Basic Questions in the Structure of Languages, 215
American Physical Society : Annual Meeting, 653
American Science Manpower—Employment and other Characteristics, 1954-55 (United States National Science Foundation), 890
American Societies for Experimental Biology, Federation of : Forty-fourth Annual Meeting, 893
American Society of Rheology : Transactions of the, Vol. 2 (edited by R. D. Andrews), *review* by Dr. G. W. Scott Blair, 878
American (South) Amphibians : Chromosomes of (Prof Francisco A. Saez and Nadir Brum), 945
American (South) Indians Publication of the Index to the Handbook of (Bureau of American Ethnology of the Smithsonian Institution), 815
Amery, A , and others : Fibrinolytic Activity of Cirrhotic Liver, 619
Amethopterin and 6-Mercaptopurine Effect of, on the Pattern of Oxygen Tension-Measurements in the Fluid Phase of Serum Agar Cultures of Bone Marrow Flecks (Dr [illegible] J. Woodliff and J. M. G Davis), 477
Amines (Volatile), in Brain (Dr. Conrad G Honegger and Ruth Honegger), 530
Amino-Acid (Essential), for the Growth of a Strain of *Shigella dysenteriae* I (*Sh. shiga*) · Cystine as an (Dr Ranjit Sen), 267
Amino-Acid Concentration . Colorimetric Determination of (Dr. W A. Vincent), 530
Amino-Acids · Selective Biological Membrane Transport of Individual (Dr. S M. Hardy), 245
Amino-Acids of some Fungi Free (R Close), 609
Amino-Acids (Labelled) : Effects of Starvation on the Ability of Isolated Rat Diaphragm to incorporate, into its Protein and to Respond to the Influence of Insulin on this Process (Dr. K. L. Manchester), 907
Amino-Acids (Phthaloyl) : Synthesis of, under Mild Conditions (G H L. Nefkens), 309
Aminoacetone · Methylglyoxal Formation from, by Ox Plasma (Dr. W H Elliott), 467
γ-Aminobutyric Acid Levels in Slices of Brain Cortex : Effect of Cations on (Dr. R Rybová), 542
γ-Aminobutyrylcholine Inhibitory Actions of (M Asano, T Noro and K. Kuriaki), 848
2-Aminoethane Phosphonic Acid . Isolation of, from Rumen Protozoa (Masaaki Horiguchi and Makoto Kandatsu), *erratum*, 146
Aminopeptidase Activity : Histochemical Evidence of, in Rat Pineal Gland (Dr Mikko Niemi and M Ikonen), 928
Ammonia Maser · Measurements of the Frequency of an, in England and Australia (A. M J Mitchell and E Sandbach), 833
Ammonium (Fixed) : Removal of, from Clay Minerals by Cation Exchange Resins (Prof A. D. Scott, A. P. Edwards and Prof. J M Bremner), 792
Amnion Cells (Human), infected with Measles Virus : Electron-dense Crystallites in Nuclei of (Richard F Baker, Prof Irving Gordon and Fred Rapp), 790
Amorphous Copper Sulphate Monohydrate : Recrystallization of (G. A Specken and Prof K J. McCallum), 758
Amphibia : Hormonal Control of Secretion in the Oviduct of the (Patricia D B Lodge and Dr C L. Smith), 774
Amphibian Eggs · Incorporation of Tritiated Uridine into (N. Bialiavsky and R Tencer), 401
Amphibians : Hormonal Control of Moulting in (C. Barker Jorgensen and Lis Olesen Larsen), 244
Amphibians (South American) Chromosomes of (Prof. Francisco A. Saez and Nadir Brum), 945
Amphidinium carteri (Dinoflagellate) Low Molecular Weight Organic Base from the (Peter J Wangersky and Robert R. L Guillard), 689
Amplifier Diode 'EW93/I' Parametric (General Electric Co , Ltd.), 355
Amplifiers · Solid State Microwave (Electronics Group and the Radio Spectroscopy Group of the Institute of Physics Conference on), 507
Anaemia (Acquired Haemolytic) Individual Specific Nature of the Cold Auto-Antibodies of (Dr T. N Mehrotra), 323
Anaerobic Glycolysis of Dispersed Cell Suspensions from Normal and Malignant Tissues (Dr M Zimmerman, T M Devlin and M. P Pruss), 315
Analogue of Adenosine Triphosphate : Vasodepressor Effect of Adenosine Phosphates and 5'-Adenylmethylenediphosphonic Acid, an (James W Flesher, Dr Y. T. Oester and T. C. Myers), 772
Analogues (Semi-Synthetic), of Pyrrolizidine Alkaloids . Hepatotoxic Activity of (Dr. R. Schoental and Dr A. R. Mattocks), 842
Analogues (Thyroxine) : Action of, on Frog Melanocytes (Dr. M Ruth Wright and Dr. Aaron B. Lerner), 169
Analysis of Grants, 1932-1955, Second Report (Leverhulme Trust), 659
Analysis (Association-) in Plant Communities (D J Harberd), 53
Analysis (Biochemical) : Methods of (edited by Prof David Glick), Vol 7, *review* by Dr D. T. Elmore, 797
Analysis (Infra-Red Absorption) · Determination of Tetrahedral Aluminium in Mica by (Dr. R J. P. Lyon and Dr. W. M Tuddenham), 374
Analysis (Neutron Activation), of Ancient Roman Potsherds (V. M. Emeleus and G. Simpson), 196
Analysis (Pharmaceutical) · Spectroscopic Methods of (Brighton Technical College School of Pharmacy Course of Lectures on), 76
Analysis (Quantitative Immuno-), in Gel Plates (Dr. J. G. Feinberg), 555
Analysis (Rotational), of the $C^2\Pi$–$X^2\sigma^+$ System of CaCl (E Morgan and Dr. R. F. Barrow), 754
Analysis (Spectrographic), of Romano-British Pottery (E E Richards and K F. Hartley), 194
Analysis (A Starch Gel Immunoelectrophoretic), of Human γ-Globulin demonstrating the Inter- and Intra-Specific Variation of Organisms (Dr. Morris Goodman), 474
Analysis (X-Ray) : The Borders of (X-Ray Analysis Group of the Institute of Physics Spring Conference on), 356
Anand, Nitya, and Davis, Dr Bernard D. · Effect of Streptomycin on *Escherichia coli*—Damage by Streptomycin to the Cell Membrane of *Escherichia coli*, 22
Anand, Nitya, and others Effect of Streptomycin on *Escherichia coli*—Uptake of Streptomycin by *Escherichia coli*, 23
Ancient Roman Potsherds : Neutron Activation Analysis of (V M Emeleus and G. Simpson), 196
Ancient Sedimentary Rocks · Presence of Carbohydrates and other Organic Compounds in (J G. Palacas, F. M. Swain and Prof. F. Smith), 234
Anderson, Sir David : Appointed a member of the Commonwealth Scholarship Committee in the United Kingdom, 505
Anderson, Dr. J. S., and others : Decomposition of Uranium Dioxide at its Melting Point, 915
Anderson, Dr W. . Chemical and Biological Action of Radiations, *review*, 202
Andrade, Prof. E. N. da C. : *Obituary* of Dr Mary D. Waller, 211
  The Birth of the Royal Society, *review*, 343

- Auroral Zone : A Day-time Maximum of Oblique Auroral Reflexions observed in the (Alv Egeland, Dr. Bengt Hultqvist and Johannes Ortner), 519
- Auroral Zone Micropulsations : Correlation of Audio-Frequency Electromagnetic Radiation with (Dr. J. Aarons, G. Gustafsson and A Egeland), 148
- Australia: The Lungworm *Protostrongylus refescens* in (A. Korthals and G Shenman), 941
  - Plant Thioglycosides and the Problem of Endemic Goitre in (H. S. Bachelard and Prof. V. M. Trikojus), 80
- Australia (England and) : Measurements of the Frequency of an Ammonia Maser in (A. M. J. Mitchell and E Sandbach), 833
- Australian Aborigine : Plasma Antihaemophilic-Factor Concentrations in the, and in Conditions associated with Hyperglobulinaemia (W. R. Pitney and M H. Elliott), 397
- Australian Atomic Energy Commission · Appointment of Dr. G C. J. Dalton as director of the Lucas Heights Research Establishment, 889
  - Installation of a second Nuclear Reactor at Lucas Heights, 889
- Australian Commonwealth Scientific and Industrial Research Organization : *Rural Research in C.S.I R O.*, 28, Preventing Evaporation from Reservoirs (W. W. Mansfield), 581
- Austwick, P. K. C (Ainsworth, Dr G. C., and) : Fungal Diseases of Animals, *review* by J. E. Smith, 720
- Auto-Antibodies (Cold), of Acquired Haemolytic Anaemia : Individual Specific Nature of the (Dr. T. N. Mehrotra), 323
- Auto-Antibody in Rats with *Plasmodium berghei* (Dr. Avivah Zuckerman), 189
- Autoclaving : Influence of Hydrogen Ion Concentration and, on Gibberellin (Dr. James H. M. Henderson), 628
- Automatic Control : Computation and, 145
  - Value of Instruments and, to the Smaller Firm (Society of Instrument Technology Conference on), 737
- Automatic Fish Egg Counter (B. B. Parrish, I. G. Baxter and M. J. D. Mowat), 777
- Automatic Programming of Digital Computers, National Centre of Information on (Brighton Technical College), 214
- Automatic Time/Response Records with *Drosophila* (G. A. Wheatley and J. A Hardman), 708
- Automation and Computation, British Conference on (British Group for Computation and Automatic Control) : Annual General Meeting, 145
  - Election of Officers for 1960, 145
- Autoradiographic Study of the Distribution in Mice of Œstrogens labelled with Carbon-14 and Tritium (Dr. J. C. De Paepe), 264
- Auxin-induced Methylation in Maize (Dr. Robert Cleland), 44
- Aviation, Ministry of : Grant of £2,000 to the Houldsworth School of Applied Science, University of Leeds, for research on the fatigue properties of ferrous and non-ferrous alloys, 892
- Avivi, Lydia (Halevy, Dr. S., and) : Effect of Kinetin on Glucose Metabolism of Chicken Embryo Fibroblasts, 388
- Avoidance Behaviour (Conditioned), Induced by Low-Dose Neutron Exposure (Dr John Garcia and Dr. Donald J. Kimeldorf), 261

Awards (Technological), National Council for : Appointment of Sir Harold Roxbee Cox as chairman, 286
Axelrod, Dr. Julius (Kopin, Dr. Irwin J., and) : Presence of 3-Methoxy-4-hydroxyphenylglycol and Metanephrine in Phæochromocytoma Tissue, 788
Axon of Protein synthesized in the Perikaryon of Regenerating Neurons : Proximo-Distal Movement along the (Dr. N. Miani), 541
Aykroyd, Dr. W. R. : Nutrition in Europe, 585
Aylward, Dr. Francis · Progress in Food Investigation, 819
Aynsley, Dr. E. E., and others : Microwave Spectrum of Fluorine Cyanide, 96
Azerbaijan : Protection of Nature in the Soviet Republic of (G. Aliev), 580
Azide (Lead) . Products of Decomposition of (M. Stammler, J. E. Abel and J. V. R. Kaufman), 456
Azotobacter Antigens of (J R. Norris), 634

BABESIAL Infections : 3:3'-Diamidinocarbanilide, a New Drug Active against (Dr. J. N. Ashley, S. S. Berg and J. M. S. Lucas), 461
Baboons (Diabetic and Normal) : Influence of Insulin on the Incorporation of 2-^{14}C-Sodium Pyruvate into Glyceride Glycerol in (N. Savage, Prof J. Gillman and C. Gilbert), 168
Bachelard, H. S , and Trikojus, Prof V. M. : Plant Thioglycosides and the Problem of Endemic Goitre in Australia, 80
Bacillus (Leprosy), *Mycobacterium lepraemurium* : Elongation of a, in a Cell-free Medium (Dr. P. D'Arcy Hart and Dr. R. C. Valentine), 58
Back Grant of the Royal Geographical Society awarded to A. T. Grove, 735
Bacteria : Intermediary Metabolism of Nitrobenzoic Acids by (R. B. Cain and N. J. Cartwright), 868
  Survival of, on Drying in Sugar/Protein Mixtures (B. R. Record and R. Taylor), 944
Bacteria (Iron) : Growth of, in Crude Tar (P H. Garnett), 942
Bacteria (Rumen) : Hydrogenation of Chloroplast Lipids by (Dr. D. E. Wright), 546
Bacterial Polysaccharides containing Sialic Acid : Chemical and Serological Relationships of certain (Prof. Guy T. Barry, Tien-Hu Tsai and Francis P. Chen), 597
Bacterial Spores (Dormant) : Permeability of (Dr Samuel H Black, Dr. R E. MacDonald, Dr. Tadayo Hashimoto and Prof Philipp Gerhardt), 782
Bacterial (Anti-) Activities : Synthetic Polypeptide Derivatives with (Dr. K. Kovács, Dr. A. Kótai and Dr. I Szabo), 266
Bacteriophages (Dr. Mark H. Adams), *review* by Dr. B. Stocker, 276
Badinez, O., and others : Cementing Substances in Metastasizing and Non-Metastasizing Transplantable Tumours in Mice, 864

Boas, Dr. Marie : The book 'Robert Boyle and Seventeenth Century Chemistry' awarded the Pfizer Prize of the History of Science Society, 660
Boateng, E. A. : A Geography of Ghana, *review* by Prof L. Dudley Stamp, 567
Bocher, Prof. T. W. : At the Conference of the Botanical Society of the British Isles to celebrate the Centenary of the publication of the 'Origin of Species' (The Development of Cytotaxonomy since Darwin's Time), 216
Bogoch, Dr. Samuel : Demonstration of Serum Precipitin to Brain Ganglioside, 392
Bojnansky, Vit : Potato Wart Disease, *Synchytrium endobioticum* (Schilb) Perc., 367
Bölger, B , and others · Dielectric Devices (Characteristics of a 1,420 Mc./s. Maser), 360
Bolognani, L , and others : Presence of Sialic Acid in Connective Tissues, 37
Bombardment (Electron), in Rock Salt : Dark Blue Ring developed by (S Yoshida and T. Ikeda), 755
Bomke, H A , and others : Global Hydromagnetic Wave Ducts in the Exosphere, 299
Bond, Dr. G. : Nitrogen Metabolism in Plants, *review*, 415
Bondam, J. : Mining Geophysics (A Study of the Disturbances due to Salt-water on Minor Loop-frame Indications), 436
Bone (Human) : Determination of Strontium-90 Distribution in (R. Bjornerstedt and S. Haggroth), 366
Bone Marrow Flecks : Effect of Amethopterin and 6-Mercaptopurine on the Pattern of Oxygen Tension Measurements in the Fluid Phase of Serum Agar Cultures of (Dr H. J Woodliff and J. M. G. Davis), 477
Bone and Tooth Society : Conference on Radioactive Materials and the Skeleton, 807
Symposium on the Matrix, 815
Bonet-Maury, P. (Bose, Prof. S R , and) : Metabolism of Polypores with Phosphorus-32, 828
Bonga, Dr. J. M. (Radforth, Prof. Norman W , and) : Differentiation induced as Season Advances in the Embryo-Gametophyte Complex of *Pinus nigra* var. *austriaca*, using Indole Acetic Acid, 332
Bonting, Dr. Sjoerd, and Rosenthal, Ira M. : Effects of the Method of Tissue Preparation on the Assay of Tissue Enzyme Activities, 686
Booker, J. D (Jenkins, D. C., and) : Aerodynamic Capture of Particles (Impingement of Water Drops on a Surface at Supersonic Speed), 665
Books · Recent Scientific and Technical, Supp. vi, January 30 ; Supp. vi, February 27 ; Supp vi, March 26
Books (Science), for a School Library (Science Masters' Association), new edition, 814
Booth, C., and Beason, L. R. · At the Ninth Canadian High Polymer Forum (Statistical Treatment of Polymer Fractionation Data), 359
Borderlands : Zoological, *review* by R. W Hayman, 643
Borders of X-Ray Analysis (X-Ray Analysis Group of the Institute of Physics Spring Conference on), 356
Boride (Silicon), SiB_4 : A New (Dr. Carl F Cline and Dr. Donald E. Sands), 456
Bork, J. F. (Coleman, L. E., and) · At the Ninth Canadian High Polymer Forum (The Reactivity Ratios of N-Vinyl Oxazolidone and N-Vinyl Pyrrolidone with Vinyl Monomers), 359
Born, Dr. G. V. R. : Appointed to the Vandervell chair of pharmacology in the Institute of Basic Medical Sciences in the University of London, 214, 430 ; work of, 430
Borough Polytechnic, London : Appointment of G Isserlis as senior lecturer in charge of the Division of Metal Science, 215
Appointment of Dr. D. B. Smith as senior lecturer in food technology, 215
Appointment of S. N. Houldsworth as lecturer in chemical engineering, 215
Appointment of Dr. B. E. Weller as lecturer in physical chemistry, 215
Appointment of Dr. H. W Hykin as lecturer in mechanical engineering, 215
Course of Lectures on Variety Reduction in Engineering, 286
Course of Lectures on Lubrication and Lubricants, 286
Course of Lectures on Foundry Sands, 286
Borsook, Dr. Henry, and others : Inactivation of Erythropoietin by Neuraminidase and by Mild Substitution Reactions, 102
Bose, Prof. S R., and Bonet-Maury, P. : Metabolism of Polypores with Phosphorus-32, 828
Botanic Gardens (Royal), Kew : Appointment of A. L. Jewell to a newly created post of exhibitions officer, 356
Appointment of Dr Keith Jones as a Principal Scientific Officer, to undertake research in cyto-genetics, 734
Botanica Marina, No 1, 658
Botanical Society of the British Isles : Conference to celebrate the Centenary of the publication of the 'Origin of Species', 216
Botanical Society (Indian) : Birbal Sahni Medal for 1959 awarded to Prof. P. Parija, 893
Botany at Belfast, 812
Botany (Agricultural), National Institute of . Appointment of G. W. G. Briggs as assistant director, 430
Bott, Dr. M. H. P. : Geological Implications of Recent Geophysical Work in the British Isles, 739
Bouckaert, J H., and Said, A. H. : Fracture Healing by Vitamin K, 849
Boudreaux, Prof. H Bruce, and Frampton, Dr. Vernon L. : A Peanut Factor for Haemostasis in Haemophilia, 469
Boura, A. L A , and others : Powerful Adrenergic Neurone-blocking Agents related to Choline 2,6-Xylyl Ether Bromide, 925
Bovine Mucosal-Disease Virus : Identification of a, isolated in Sweden as *Myxovirus para-influenzae* 3 (K. Bakos and Dr. Z. Dinter), 549
Bovine Pituitary Thyrotropin : Neutralization of Human Serum and Pituitary Thyrotropic Fractions with Antisera to (Dr. Sidney C. Werner, Ephraim Otero-Ruiz, Beatrice C. Seegal and Robert W. Bates), 472
Bowden, Dr. B. V. : Awarded a grant of £500 from the Paul Instrument Fund (in supplement of a previous grant), for the development of narrow pass-band dye filters, 504
Bowen, G. D. (Rovira, A D., and) . Effect of Micro-organisms on the Development of Roots and Root Hairs of Subterranean Clover (*T. subterraneum*), 260
Bowie, S H U. : Geological Implications of Recent Geophysical Work in the British Isles, 739
Bowles, R., and others : Photolysis of 1:3-Dichlorotetrafluoroacetone, 683
Boyd, Hugh (edited by Peter Scott and) : Tenth Annual Report of the Wildfowl Trust (1957-58), 147
Boyden, Dr Stephen V. : Antibody Production, 724
Boyer, Dr. Georgiana : Chorioallantoic Membrane Lesions produced by Inoculation of Adult Fowl Leucocytes, 327
Boyle (Robert) and Seventeenth Century Chemistry (Dr. Marie Boas), awarded the Pfizer Prize of the History of Science Society, 660
Bradford Institute of Technology (Department of Chemical Technology) : Symposium on Fluorescence and Fluorescent Compounds, 893
Bradley, P B. (Ansell, Dr. G. B., and) : A Rationale for Behaviour, *review*, 128
Braekken, Haakon : Mining Geophysics (Education of Mining Geophysicists), 437
Brain : Distribution of Tryptophan in the (Shirley A. P. Price and Dr. G. B. West), 470
Reserpine and the Levels of Serotonin and Norepinephrine in the (H. Sheppard and J. H. Zimmerman), 40
Volatile Amines in (Dr. Conrad G Honegger and Ruth Honegger), 530
Brain Cortex · Effect of Cations on γ-Aminobutyric Acid Levels in Slices of (Dr. R Rybová), 542
Brain Ganglioside : Demonstration of Serum Precipitin to (Dr. Samuel Bogoch), 392
Brain Rhythms in a Socially Isolated Community : Intelligence, Personality and (A. C. Munday-Castle and G. K. Nelson), 484
Brain (Mid-) (Cerebellar and) Lesions in Scrapie (Dr. I. Zlotnik), 785
Brambell, Prof. F. W. Rogers · Appointed a member of the University Grants Committee, 12
Brancker, Dr. A. V. : Solar Stills in Iraq, 362
Brasher, Dora M. : Corrosion Inhibition and the Zero Charge Potential of Metals, 838
Brauer, Dr. G., and others : Molybdenum and Niobium Sulphides, 376
Braunbeck, J. : Emission Spectroscopy with Infra-Red Double-Beam Spectrophotometers, 754
Breakdown of Haemoglobin : Formation and (Association of Clinical Biochemists and the Biochemical Society Symposium on), 737
Breen, A. : Mining Geophysics (Employment of Phase-sensitive Voltmeters in Measuring Electromagnetic Fields), 436
Bremner, Prof. J. M , and others : Removal of Fixed Ammonium from Clay Minerals by Cation Exchange Resins, 792
Breuer, Dr. H. : Isolation of 17-*Epi*oestriol from the Urine of Pregnant Women, 613
Brewer, Dr. D. F. : Generation of Temperatures below 1°K., 349
Bridge, N. K. : Electron Spin Resonance of γ-Irradiated, Substituted Toluenes, 30
Briggs, G. W. G. : Appointed assistant director of the National Institute of Agricultural Botany, 430 ; work of, 430
Brighton Technical College : Establishment of the National Centre of Information on Automatic Programming of Digital Computers, 214
Course of Lectures on Spectroscopic Methods of Pharmaceutical Analysis, 76
Brimble, L. J F. : *Obituary* of W. E Dick, 577
Brinck, P. : The Biology of the Southern Cold Temperate Zone, 206
Britain : Development of Atomic Energy in, 127
Myxomatosis in (Hon Miriam Rothschild), 257
Professional Engineers in, 5
Public Health Laboratory Service in, 505
Recent Geophysical Work in (Prof. J. H. Taylor), 739
Science in Civil Life in, 583
Scientific Man-power in, 145
State Aid for Museums and Art Galleries of, 890
Teacher Training in, 432
See also under Great Britain
Britain Turns to Oil Heat, 355
Britain (Highland) : Upland Climate and Land Usage, with special reference to (Third Symposium on Aspects of Agricultural Meteorology), (University College, Aberystwyth), 737
Britain and Eire : Potassium–Argon and Rubidium–Strontium Ages of some Granites from (Prof J. L. Kulp, Dr. L. E. Long, C. E. Griffin, Dr. A. A. Mills, Dr. R. StJ Lambert, Dr. B J. Giletti and Dr. R K. Webster), 495
British Agricultural History Society : Eighth Conference, 893
British Archaeology, Council for (Research Committee on Industrial Archaeology) : Conference on Industrial Archaeology, 357
British Association for the Advancement of Science : Granada Lectures—Science and Communication (Sir Edward Appleton) ; Television and Politics (Edward R. Murrow) ; Dons or Crooners? (Sir Eric Ashby), *review* by B. Silcock, 130
Installation of Sir George Thomson as president for 1960, 145
British Coal Utilization Research Association Symposium on Aerodynamic Capture of Particles, 664
British Commonwealth · The Wandering Scholar in the, 271

INDEX

British Conference on Automation and Computation (British Group for Computation and Automatic Control) : Annual General Meeting of the, 145
  Election of Officers for 1960, 145
British Council : Appointment of Sir Patrick Linstead as chairman of the Science Advisory Committee and a member of the Executive Committee, 286
  Annual Report for 1958-59, 662
British Digital Computer Information Centre, 214
British Embassy in Moscow . Appointment of Dr. D. A. Senior as scientific attaché, 356
British Empire Cancer Campaign : Thirty-sixth Annual Report (1958), 500
British Federation of University Women, North-Eastern Association of the (Department of Extra-Mural Studies and Education of King's College, Newcastle-upon-Tyne, in conjunction with the) : Refresher Course on Science in Schools, 286
British Food Manufacturing Industries Research Association : Conference on Science and Food, 737
British Gelatine and Glue Research Association : Eighteenth Meeting of the Research Panel, 587
British Glues and Chemicals, Ltd. : Report on Proteins from Grass, 891
British Hat and Allied Feltmakers Research Association : Twelfth Annual Report (1958-59), 582
British Isles : The Birds of the (Dr. David Armitage Bannerman), Vol 8, Phalacrocoracidae, Sulidae, Fregatidae, Procellariidae, Diomedeidae, Podicipedidae, Gaviidae, Columbidae, Pteroclididae, *review* by Sir Landsborough Thomson, 121
  The Freshwater Life of the (John Clegg), second edition, *review* by Dr. W. J. Rees, 801
  Geological Implications of Recent Geophysical Work in the (Geological Society of London Symposium on), 76, 739
  Beetles of the (E. F. Linsen), *review* by R T. Thompson, 721
British Museum (Natural History) : Instructions for Collectors, No. 11, Collecting Fossils, Minerals and Rocks, seventh edition, 432
  Bulletin, Historical Series, Vol. 2, No. 1, Darwin's 'Journal' (edited by Sir Gavin de Beer), 580
  Retirement of Sir Gavin de Beer from the directorship, 582, 888
  Appointment of Dr. T. C. S. Morrison-Scott as director, 582, 888
British Occupational Hygiene Society : International Symposium on Inhaled Particles and Vapours, 14, 433
British Overseas Information Services, 506
British Postgraduate Medical Federation : Lectures on the Scientific Basis of Medicine, Vol. 7, 1957-58, *review* by Prof. R. A. McCance, 202
British School at Athens : The Annual of the, No. 52, 1957, *review* by Dr. Hugh Plommer, 493
British Schools : Laboratory Accommodation in, 812
British Scientific Attaché in Moscow, 356
British Scientific Attachés, 657
British Society of Rheology : Proceedings of a Conference on the Rheology of Disperse Systems, Swansea, 1957 (edited by C. C. Mill), *review* by Dr G. W. Scott Blair, 878
British Trust for Ornithology and the Forestry Commission Conference on Birds and Forests, 731
British Weed Control Council : Symposium on Herbicides and the Soil, 356
Brittle Materials : Non-Metallic, *review* by Dr. David Train, 344
Brittle Materials (Non-Metallic) : Mechanical Properties of (edited by W. H. Walton), (Proceedings of a Conference on Non-Metallic Brittle Materials, organized by the Mining Research Establishment of the National Coal Board in consultation with the Building Research Station (D.S I.R.), London, 1958), *review* by Dr. David Train, 344
Broecker, Prof. Wallace S , and others : Radiocarbon Measurements and Annual Rings in Cave Formations, 93
Brogan, Prof Denis : *Obituary* of Sir Ernest Barker, 809
Broida, Dr. H. P., and others : Some Atomic Reactions by Absorption Spectroscopy, 759
Bromide (Choline 2,6-Xylyl Ether) · Powerful Adrenergic Neurone-blocking Agents related to (A. L. A Boura, G. G. Coker, F. C. Copp, W. G. Duncombe, A. R. Elphick, A. F. Green and A. McCoubrey), 925
Bromocresol Green : Scanning of Paper Electrophoretograms after Protein Dyeing with (A Clark), 243
Bronze Figures from Nigeria (Frank Willett), 581
Brook, A. H., and others : Formation of New Wool Follicles in the Adult Sheep, 51
Brook, A. H. (Alexander, G., and) : Loss of Heat by Evaporation in Young Lambs, 770
Brooke, G., and others : Momentum Spectrum of Cosmic Rays at Sea-Level, 364
Brooks, R. R. : Dissolution of Silicate Rocks, 837
Brothers, Dr. R. N. : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 212
Brown, Dr. D. J : Aerodynamic Capture of Particles (Behaviour of Particles in the Process of Froth Flotation), 665
Brown, Sir Lindor : Appointed a vice-president of the Royal Society, 74
  Appointed to the Waynflete chair of physiology in the University of Oxford, 733 ; work of, 733
Brown, Dr. R. D : Appointed professor of chemistry in the University of Monash, Melbourne, 286
Brown, R. H. J., and Harker, Janet E. : A Method of Controlling the Temperature of Insect Neurosecretory Cells *in situ*, 392
Brown, Dr. W Lynn, and others : The Shuttle-Box Behaviour of Albino Rats during Prolonged Exposure to Moderate-Level Radiation, 665
Brownstone, A. D. (Tata, Dr. J. R , and) : Synthesis of Tritium-labelled Tyrosine, 3:5-Diiodotyrosine and Thyroxine, 34
Bruce, J. H., and Balmer, J. R. : Dielectric Devices (The Need for Thin-film Capacitors and the suitability of an Evaporation Method for producing these), 361
Brum, Nadir (Saez, Prof. Francisco A., and) : Chromosomes of South American Amphibians, 945
Brundrett, Sir Frederick : *Obituary* of Sir Henry Tizard, 209
Brunet, P. C J., and others : Specificity *in vitro* of a Phenoloxidase System from *Periplaneta americana* (L.), 610
Bruns, Dr. Herbert : Birds and Forests (Various Aspects of Forest Research on Economic Ornithology in Germany), 731
Brunston, R. G W. Geological Implications of Recent Geophysical Work in the British Isles, 739
Bryant, Dr. F. J., and Pierson, Dr. D. H. : Radioactive Materials and the Skeleton (Strontium-90 in the Environment and in Human Bone), 808
Brzeski, Dr. W., and Rucker, Dr. W. : Biosynthesis of Chlorophylls *a* and *b* in *Chlorella vulgaris*, 922
Buchdahl, Gerd : Pictorial History of Philosophy, *review*, 67
Buckingham, J. : Retirement as director of research programmes and planning in the Royal Naval Scientific Service, 578 ; work of, 578
Buckley, Dr. Oliver E. : *Obituary* by Dr. F. B. Llewellyn, 655
Buechner, Dr. H. K., and others : Control of African Wild Animals, 47
Bueding, Dr. Ernest : Host Influence on Parasite Physiology, 898
Buffer Gradients · Serum Chromatography on Columns connected to a Common Source of (A G. M. Marr and C. M Gilbo), 853
Building Research Board · Appointment of R. M. Wynne-Edwards as chairman for 1960-65, 893
Building Research Station (D.S.I.R.), (Mining Research Establishment of the National Coal Board in consultation with the) : Conference on Non-Metallic Brittle Materials—Proceedings, Mechanical Properties of Non-Metallic Brittle Materials (edited by W. H. Walton), *review* by Dr. David Train, 344
Building Science at Sheffield, 144
Bulk Conductivity (Surface-controlled), in Organic Crystals (Dr. H Kallmann and Dr M Pope), 753
Bull, C., and Irving, E. : Palaeomagnetism in Antarctica, 834
Bull, G. A. : Comparison of Rain-Gauges, 437
  Meteorology for Geographers, *review*, 720
Bull : Influence of Ejaculation Frequency on the Time required for Sperm Formation and Epididymal Passage in the (Dr. H. H. Koefoed-Johnsen), 49
Bullerwell, Dr. W. : Geological Implications of Recent Geophysical Work in the British Isles, 740

Burfoot, Dr. J. C. : Dielectric Devices (Switching in Ferro-electrics), 361
Burhop, E. H. S. : Planning in Science, 739
Burkitt, M. C. : Uganda in Black and White, *review*, 567
  The Dark Age in Africa, *review*, 645
Burley, Dr. D. M. · Appointed lecturer in applied mathematics at the University of Sheffield, 737
Burma Research Society, 579
Burns, B. D. (Morley, C. W., and) : Influence of Guinier–Preston Zones on the Electrical Resistivity of Age-hardening Alloys, 914
Bursaries Scheme (Commonwealth) : Royal Society and Nuffield Foundation (Awards), 212
Burstone, Dr. M. S. : Histochemical Demonstration of Succinic Dehydrogenase Activity in Osteoclasts, 866
Bursts (Solar Radio), and Low-Energy Cosmic-Rays (Dr. A. R. Thompson and Dr. A. Maxwell), 89
Burton, Dr. J. D., and others : Relationship between the Rate of Fall-Out and the Concentration of Strontium-90 in Human Diet in the United Kingdom, 498
Burton, Milton · Radiolyse de Liquides organiques, *review* by Dr. W. Anderson, 202
Busse, W. F. : At the Ninth Canadian High Polymer Forum (Colour Film on Polymer Interactions), 358
Butler, Dr. Warren L. : Chlorogenic Acid of Lettuce Seeds, 856
Butterflies and Moths, *review* by Paul E. S. Whalley, 800
Bywater, S. (Worsfold, D. J , and) : At the Ninth Canadian High Polymer Forum (Some Properties of Poly-α-methylstyrene produced by Anionic Polymerization), 359

CADELL, P. B., and Cousins, F. B. : Urinary Selenium and Dental Caries, 863
Cadman, W. A. : Birds and Forests (Progression of Wild Life at various stages in the Development of Forests), 732
Cadmium Iodide and Mercuric Chloride : Ultrasonic Velocities in Aqueous Solutions of (S. V. Subrahmanyam), 371
Caesium-137 : Accumulation of, by Plants grown in Simulated Pond, Wet Meadow and Irrigated Field Environments (Dr. R. C. Pendleton and Dr. R. L. Uhler), 707
Cain, R B., and Cartwright, N. J. : Intermediary Metabolism of Nitrobenzoic Acids by Bacteria, 868
Calcium : Inactivation of Acid Phosphatase in Human Prostatic Homogenates *in vitro*—Role of (Prof. H. J. Tagnon and A. Steens-Lievens), 48
CaCl : Rotational Analysis of the $C^{2}\Pi$-$X^{2}\sigma^{+}$ System of (E. Morgan and Dr. R. F. Barrow), 754
Calcium Ferrite Phases . Two New Complex (Stig Holmquist), 604
Calcium–Lithium Competition in Absorption by Plant Roots (Emanuel Epstein), 705
Calcium Sulphate Hemihydrate : The α- and β-Forms of (D. A. Powell), 375
Calculation of Cosmic-Ray Ages in the Iron Meteorites 'Carbo' and 'Treysa' (Dr. H. Voshage and Dr. H. Hintenberger), 88 ; (Dr. Royal R. Marshall), 89
Calver, M. A. : Awarded the Wollaston Fund of the Geological Society of London, 657
Cameron, J. M : Appointed professor of philosophy in the University of Leeds, 892
Camp, Prof. W. H. : At the Conference of the Botanical Society of the British Isles to celebrate the Centenary of the publication of the 'Origin of Species' (Ways in which Evolution is occurring in the World To-day), 216
Campaign for Nuclear Disarmament : Formation of a Scientists Group, 815
Campbell, Dr. Bruce : Bird Watching for Beginners, revised edition, *review* by J. D. Macdonald, 415
  Birds and Forests (Population Problems in a Typical Insect-eating Forest Bird, the Pied Flycatcher), 732

Campbell, Dr. W. H.: Micropulsations in the Earth's Magnetic Field simultaneous with Pulsating Aurora, 677
Campbell, Dr. W. H., and others: Rare Hiss, Earth Currents and Micropulsations on November 27, 1959, 231
Canadian Committee on Oceanography, 730
Canadian High Polymer Forum: Ninth (Prof K. E. Russell), 358
Cancer (Rat): Diathelic Immunization of Sheep against a (Prof. B. Sekla and E. Holečková), 618
Cancer Campaign (British Empire): Thirty-sixth Annual Report (1958), 500
Cancer Research: Progress of, 500
  Provision of Animals for (Laboratory Animals Centre Symposium on), 660
Canes (Sultana): Effect of Direction of Growth on (P May), 394
Cantelli, Gianfranco (a cura di): Lettere a una Principessa Tedesca (Leonhard Euler), *review* by L. Roth, 717
Caplan, Dr. S. R: A Synergic Method of Carrying out Continuous Electrochromatography, 378
Capsular Polysaccharides from Thirteen Strains of *Cryptococcus neoformans*: Infra-Red Spectra of (Dr. H. H. Gadebusch), 610
Capture (Aerodynamic), of Particles (British Coal Utilization Research Association Symposium on), 664
Capturing Birds and Mammals A Technique for (Ronald F Labisky), 659
Caradine, M: The World is Round, *review*, 67
Caradine, P. E. (Swain, A, and): An International Tagging Test with Salmon (*Salmo salar* L) Smolts, 206
Carassius auratus (Goldfish): Mitochondria of (Dr. M. S. Kanungo), 862
'Carbo' and 'Treysa' (Iron Meteorites): Calculation of Cosmic-Ray Ages in the (Dr H. Voshage and Dr. H. Hintenberger), 88; (Dr. Royal R. Marshall), 89
Carbohydrate Chromatography: Benedict's Solution as a Developer in (Roderick P Murphy), 455
Carbohydrates (High Molecular Weight) Physical, Chemical and Biological Methods of Study in (Chemical Society Symposium on), 507
Carbohydrates and other Organic Compounds in Ancient Sedimentary Rocks Presence of (J G. Palacas, F M Swain and Prof. F Smith), 234
Carbohydrates (Acidic) Paper Chromatography of (Dr. David A. Rees), 309
Carbon-14 Effect of Streptomycin on the Incorporation of Tyrosine labelled with, into Protein of *Mycobacterium* Cell Fractions *in vivo* (Dr. T. Erdos and Dr. Agnes Ullmann), 100
  Labelling of Deoxyribose with, in relation to Incorporation of Phosphorus-32 into the Nucleotides of Deoxyribonucleic Acid of Rat Thymus Cells (Dr. S. Itzhaki), 614
  Metabolism of Bemegride labelled with (P. J. Nicholls), 927
Carbon-14 and Tritium An Autoradiographic Study of the Distribution in Mice of Œstrogens labelled with (Dr J C De Paepe), 264
Carbon Dioxide Assimilation by *Leishmania donovani* (Dr. A N Chatterjee and Dr J. P Ghosh), 322
Carbon Dioxide Output of *Periplaneta americana*: A Temperature-dependent Endogenous Rhythm in the Rate of (Dr. M B Wilkins), 481
1-^{14}C Lignoceric Acid in the Rat: Metabolism of (Dr. S Gatt and Dr. B. Shapiro), 461
Carbon Monoxide—Oxygen Mixtures: Second Explosion Limit of Dried (P. G. Dickens, J. E. Dove, J. F. Harrold and Dr. J W Linnett), 606
2-^{14}C-Sodium Pyruvate into Glyceride Glycerol: Influence of Insulin on the Incorporation of, in Diabetic and Normal Baboons (N. Savage, Prof. J Gillman and C. Gilbert), 168
Carbon Tetrachloride–Water–Dissolved Helium System: Effect of Ultrasonic Insonation on the (Martin R Levy), 159
Carbonates of Uranium (Balaram Sahoo and Dr D. Patnaik), 683
Carcinogenesis (Radiation), a New Hypothesis (Dr P. R J Burch), 135
Carcinogenic Substance (Endogenous): 'Carcinolipin', an (Dr. J Hradec and Dr J Kruml), 55
'Carcinolipin', an Endogenous Carcinogenic Substance (Dr. J. Hradec and Dr J. Kruml), 55
Carcinoma (*C3H* Mouse Mammary): Estimation of the Cellular Lethal Dose and the Critical Cell Number for the, from Radiosensitivity Studies *in vivo* (A. Cohen and L Cohen), 262
Cardiac Glycosides and Inorganic Ions: Effect of, on Binding of Serotonin by Platelets (Herbert Weissbach, Betty G. Redfield and Elwood Titus), 99
Cardiology: Asian–Pacific Congress of, 582
Careers (Academic), of Entry of 1955 (University of Cambridge Sociological Society), 218
Carey, Jocelyn E., and Wright, Dr. E. A.: Isolation of the Neurotoxic Component of the Venom of the Sea Snake, *Enhydrina schistosa*, 103
Carib Indians (Oyana and): Distribution of Gm^{a} and Gm-like among Javanese, Djuka Negroes, and (Prof Arthur G. Steinberg, Rachel Stauffer and Hugh Fudenberg), 324
Caries (Dental): Urinary Selenium and (P. B. Cadell and F. B Cousins), 863
Carlberger, Gunnar, and others: Excretion of Rose Bengal in Bile, 847
Carlisle, Dr D B. Cyclical Activity in Endocrine Systems (Moulting Cycles in Crustacea), 664
Carmichael, Prof. Emmett B: *Obituary* of Dr. Hsien Wu, 809
Carnegie Institution of Washington: Report of the President for 1958-1959, 641
Carnitine in Lipid Metabolism (E P. Adams, P. E. Ballance and A. E. Bender), 612
Carotene *in vitro*: Formation of (H. Yokoyama, Prof. C. O. Chichester and Prof G. Mackinney), 687
Carotid Body of the Rhesus Monkey: Fine Innervation of the (R. P. Gould), 183
Carr, Dr. D J: Appointed professor of botany in Queen's University, Belfast, 286, 812; work of, 812
Carrington, W. K. (Lenz, R. W, and): At the Ninth Canadian High Polymer Forum (The Preparation of Phenylene Sulphide Polymers by the Macallum Polymerization), 360
Carroll, A P., and others: A New Route to 1-Substituted Pyrazole-4-Carboxylic Acids, 460
Carroll, Dr. D. (Pommer, Dr. A. M., and): Interpretation of Potentiometric Titration of H-Montmorillonite, 595

Carrying out Continuous Electrochromatography: A Synergic Method of (Dr. S. R. Caplan), 378
Carter, Dr. Randall W. (Fetner, Dr. Robert H., and): Reduction of the Radioactive Content of Milk by a Feeding Procedure, 858
Cartwright, H.: Appointed director of industrial power in the Development and Engineering Group of the United Kingdom Atomic Energy Authority, 354; work of, 354
Cartwright, N. J. (Cain, R. B., and): Intermediary Metabolism of Nitrobenzoic Acids by Bacteria, 868
Carugo, Adriano, e Geymonat, Ludovico (a cura di): Discorsi e Dimostrazioni Matematiche intorno a due Nuove Scienze (Galileo Galilei), *review* by L. Roth, 717
Case for Extra-Sensory Perception, *review* by Dr. E. J. Dingwall, 646
Casein labelled with Iodine-131 as a Substrate for the Measurement of Trypsin and Chymotrypsin (Dr. Bernard J. Katchman, Dr. Robert E. Zipf and Dr. George M. Homer), 238
Caso, O. H., and others: Effect of Gibberellic Acid on Flower Differentiation in Petkus Winter Rye, 477
Cassels, Prof J. M.: Retirement from the chair of physics in the University of Liverpool, 284; work of, 284
Castellani, A A., and others Presence of Sialic Acid in Connective Tissues, 37
Castelli, John P., and others: Observations on the Solar Eclipse of October 2, 230
Catabolic Hormone (Protein), in the Isolated Perfused Rat Liver: Glucagon, a (Prof. Leon L. Miller), 248
Cathode-Ray Presentation of Chromatograms (R. P. W Scott), 312
Cation Exchange Resins: Removal of Fixed Ammonium from Clay Minerals by (Prof A. D Scott, A. P. Edwards and Prof. J. M. Bremner), 792
Cations: Effect of, on γ-Aminobutyric Acid Levels in Slices of Brain Cortex (Dr. R. Rybová), 542
Cattle (Domestic) Some Red-Cell Antigens of *Bison bonasus* as compared to Red-Cell Antigens of (Prof. M. Czaja and J. Gasparski), 184
Cause (Possible), of Magnesium Deficiency: Dietary Phytate as a (Dr. A. Heulwen Roberts and Prof John Yudkin), 823
Cavanaugh, J. R., and others: Evidence for the Existence of a Potassium Rhenium Hydride and its Bearing on the Nature of the (—1)-Oxidation State of Rhenium, 528
Cave Formations: Radiocarbon Measurements and Annual Rings in (Prof. Wallace S. Broecker, Dr. Edwin A Olson and Dr. Phil C. Orr), 93
Cavity Formation in Simple Pipes due to Rupture of the Water Column (B. B. Sharp), 302
Cell Cultures (Serum-free and Serum-containing): Multiplication of Vaccinia Virus in (Robert W. Pumper, Lawrence J. Alfred and David L. Sackett), 123
Cell Fractions (*Mycobacterium*), *in vivo*: Effect of Streptomycin on the Incorporation of Tyrosine labelled with Carbon-14 into Protein of (Dr. T. Erdos and Dr. Agnes Ullmann), 100
Cell Membrane of *Escherichia coli*: Damage by Streptomycin to the (Effect of Streptomycin on *Escherichia coli*), (Nitya Anand and Dr. Bernard D. Davis), 22
Cell Model (Upjohn), at the Royal Scottish Museum, 13
Cell Number (Critical), for the *C3H* Mouse Mammary Carcinoma: Estimation of the Cellular Lethal Dose and the, from Radiosensitivity Studies *in vivo* (A. Cohen and L. Cohen), 262
Cell Suspensions (Dispersed), from Normal and Malignant Tissues: Anaerobic Glycolysis of (Dr. M. Zimmerman, T. M. Devlin and M P. Pruss), 315
Cell (Red), Agglutination by Stromal Material in Haemolysates (S. B. de C. Baker), 547
Cell (Red-) Antigens of *Bison bonasus*: Some, as compared to Red-Cell Antigens of Domestic Cattle (Prof M. Czaja and J. Gasparski), 184
Cell (Red-) Antigens of Domestic Cattle: Some Red-Cell Antigens of *Bison bonasus* as compared to (Prof. M. Czaja and J. Gasparski), 184
Cell-free Extracts of *Neurospora crassa*: Mediation of the Genetic Control of Protein Synthesis in (S. D. Wainwright), 314
Cell-free Extracts of *Nitrosomonas europaea*: Oxidation of Hydroxylamine in (Dr. D. J. D. Nicholas and Dr. O. T. G. Jones), 512
Cell-free Medium: Elongation of a Leprosy Bacillus (*Mycobacterium lepraemurium*) in a (Dr. P. D'Arcy Hart and Dr. R. C. Valentine), 58
Cell-Growth of Plant Roots, Inorganic Salts and Native Serum Proteins (Dr. Folke Rønnike), 151
Cell Wall of the Green Algae, *Codium*, *Acetabularia* and *Halicoryne*: Chemical Nature of the (Yoshihiko Iriki and Tomoo Miwa), 178
Cells: Experimental Transformation of (Dr. Honor B. Fell), 882
Cells (Cultured), of Whole Mouse Embryos: Influenza A' Infection of (J V T. Gostling), 328
Cells (Ehrlich Ascites Tumour): Action of Antibodies and Plasmin on (Dr. I Ginsburg and M. Ram), 328
Cells (Ehrlich's Ascites Tumour): Activity of a Substance extracted from the Fermentation Products of *Acetobacter aceti* on (G. A. Lanzani and A. Pecile), 175
Cells (Germ-) in *Xenopus laevis*: Transfer of (Dr. Antonie W. Blackler), 859
Cells (HeLa): Persistence of Herpes Simplex Virus in (Dr. Carmen Gil Fernandez), 268
Cells (Human Amnion), infected with Measles Virus: Electron-dense Crystallites in Nuclei of (Richard F. Baker, Prof. Irving Gordon and Fred Rapp), 790
Cells (Insect Neurosecretory), *in situ*: A Method of Controlling the Temperature of (R. H. J. Brown and Janet E. Harker), 392
Cells (Isolated): Inhibition of the Inductive Phase of the Antibody Formation by 6-Mercaptopurine examined by the Transfer of (Dr. J. Sterzl), 256
Cells (Leydig), in the Human Testicle: Relation of, to the Tubules and Testicular Function (J. B. W. Hailey), 865
Cells (Mast): Histochemical Demonstration of a Species-Specific Trypsin-like Enzyme in (G G. Glenner and L. A. Cohen), 846
Cells (Plant): Occurrence of an Organ-Specific Antigen associated with the Microsome Fraction of, and its Possible Significance in the Process of Cellular Differentiation (Dr. S. T. C. Wright), 82
Cells (Rat Thymus): Labelling of Deoxyribose with Carbon-14 in relation to Incorporation of Phosphorus-32 into the Nucleotides of Deoxyribonucleic Acid of (Dr. S. Itzhaki), 614
β-Cells (Human Pancreatic): Evidence for the Hexose Monophosphate Pathway for the Glucose Metabolism in (Dr. James B. Field, Phyllis Johnson, Betty Herring and Arnold N. Weinberg), 468

Cellular Differentiation : Occurrence of an Organ-Specific Antigen associated with the Microsome Fraction of Plant Cells and its Possible Significance in the Process of (Dr. S. T. C. Wright), 82
Cellular Lethal Dose and the Critical Cell Number for the *C3H* Mouse Mammary Carcinoma . Estimation of the, from Radiosensitivity Studies *in vivo* (A. Cohen and L. Cohen), 262
Cellulose : Deuterium–Hydrogen Exchange between Water and Macromolecules—Accessibility of (Dr. John R. Morrison), 160
Cellulose (Partially Methylated) : Optical Rotatory Dispersion Studies on (W. Brock Neely), 159
Cellulose Pulp and Allied Products (Dr Julius Grant), *review* by Dr. F. Lyth Hudson, 646
Cementing Substances in Metastasizing and Non-Metastasizing Transplantable Tumours in Mice (G. Gasić, F. Loebel and O Badinez), 864
Centenaries in 1960 . Scientific (Joan M. Eyles), 8
Centenary of the House of Dallmeyer, 505
Centenary of the publication of the 'Origin of Species' (Botanical Society of the British Isles Conference to celebrate the), 216
Central Advisory Council for Education (England) : 15 to 18, a Report of the, Vol. I, Report (Ministry of Education), 341, 873
Central Africa : University Education in (Prof. F. G Young), 816
Central Auditory Neurones : Pitch Discrimination in Orthoptera (Insecta) demonstrated by Responses of (Dr. G. A. Horridge), 623
Central Electricity Generating Board : Research Fellowship in the Physical Sciences, 286
  Research on Coal Utilization, 431
Central Nervous System : Mitotic Pattern and Histogenesis of the (Dr. S. Fujita), 702
Central Stimulant Drugs : Methanesulphonic Acid Derivatives of (Dr. W. Logemann, F. Lauria and D Artini), 532
Centriole (Proximal) . Position of the, in Flagellate Spermatozoa (Prof J. Bronte Gatenby and R. S. Mathur), 861
Ceramic Association (European) : Seventh International Congress, 660
Cercaria (A New), of the Subfamily Gymnophallinae (Trematoda Digenea) developing in a Unique 'Parthenita' in *Littoria saxatilis* (Olivi), (B. L. James), 181
Cerebellar and Midbrain Lesions in Scrapie (Dr. I. Zlotnik), 785
Cerebral Phospholipids *in vivo* : Incorporation of Orthophosphate Labelled with Phosphorus-32 into (Dr. G B. Ansell and S. Spanner), 826
Ceresa, R J , and Cotton, F. H : At the Ninth Canadian High Polymer Forum (The Mechanico-Chemical Modification of High Polymers), 359
CERN—*see under* European Organization for Nuclear Research
Ceruloplasmin : Turnover of the Copper and Protein Moieties of (Prof David Gitlin and Charles A Janeway), 693
Cetacea (Suborders Odontoceti and Mystacoceti) : Some Similarities and Dissimilarities in the Structure of the Skin among the Members of the (Dr. W. Sokolov), 745
Chai, Dr. C. K. : Response of Inbred and F^1 Hybrid Mice to Hormone, 514
Chain, Prof. E. B. : Appointed to the chair of biochemistry in the Imperial College of Science and Technology, 895
Chain, Prof. E. B., and others : Incorporation of α, ω-Dicarboxylic Acids as Side-Chains into the Penicillin Molecules, 97
Chain-length : Dependence of Periodic Activation and Inhibition of Monoaminoxidase by Aliphatic Compounds upon (Dr. George C. Cotzias and Dr James J. Greenough), 384
Chain Transfer in Mixed Solvent Systems (Uma Shankar Nandi and Santi R. Palit), 235
Chakravorty, Animesh, and Basu, Dr. Sadhan : Crystal Spectrum of Copper Biguanides, 681
Chamberlain, A. C. . Aerodynamic Capture of Particles (Deposition Experiments on Radioactive Particles and Gases), 665
Champion, Sir Harry : Development of Wood-using Industries, 894
Chan, S. T., and Chang, Prof K. S. F. : Relation of Eye Dominance and Eye Closure, 539
Chance, Prof. Britton, and Hollunger, Dr Gunnar : Energy-linked Reduction of Mitochondrial Pyridine Nucleotide, 666
Chance and Providence—God's Action in a World governed by Scientific Law (Dr. William G Pollard), *review* by the Rev. Dr. E. L. Mascall, 875
Chancellor, Dr. S. F. · Toxicity of Plastics, 841
Chandler, Prof A. B. : Sedimentation of Blood without Anticoagulants, 697
Chandos, Viscount : Awarded the Messel Medal of the Society of Chemical Industry, 433
Chandrasekhar, Prof. S. : Infant Mortality in India, 1901-55, *review* by Prof. L. Dudley Stamp, 801
Chang, Prof. K. S. F. (Chan, S. T., and) : Relation of Eye Dominance and Eye Closure, 539
Changes in Outdated Human γ-Globulin Preparations (F. Skvařil), 475
Changes (Moisture) : Effect of, on Creep in Wood (L. D Armstrong and R. S. T. Kingston), 862
Changing Coastlines, *review* by Prof. L. Dudley Stamp, 564
Chapiro, A., et Magat, M. : Polymérisations amorcées par le Radiations ionisantes, *review* by Dr W. Anderson, 202
Chapman, Ann . Terrestrial Ostracods of New Zealand, 121
Chapman, Gerald O , and others : Immunity of Mice surviving Systemic Leukaemia (L1210) to Antifolic Resistant Variants of the Disease, 219
Chapman, J. Vincent : Your Secondary Modern Schools, *review* by T. H. Hawkins, 719
Characteristics of *Thiobacillus thioparus* (Margaret Townshend and D. White). 870
Characteristics (Observed), of an Ultra-High-Frequency Signal Traversing an Auroral Disturbance (J C James, L. E Bird, R. P. Ingalls, M L. Stone, J. W B Day, G E. K. Lockwood and R O. Presnell), 510
Characteristics (Surface), of Fractured Poly (methyl methacrylate), (Dr. James P. Berry), 91
Charlesby, A. : Effets des Rayonnements de grande énergie sur les Polymères, *review* by Dr. W. Anderson, 202
Chatterjee, Dr. A. N., and Ghosh, Dr. J. J : Carbon Dioxide Assimilation by *Leishmania donovani*, 322
Chauvenet Prize of the Mathematical Association of America awarded to Prof Cornelius Lanczos, 146
Chelates (Copper) : Anti-Tumour Activities of (Dr. Kazuhiko Takamiya), 190
Chelating Agents in the Treatment of Poisoning by Polymerizable Radioelements (Jack Schubert and Joan F. Fried), 551
Chemical (Synthetic) : Reduction of Intestinal Absorption by a (Dr. J. A. Nissim), 222
Chemical (Immuno-) Observations on Antisera to Purified Human Growth Hormone (Prof. Melvin M Grumbach, Dr. Selna L. Kaplan and Dr. Sheila Solomon), 170
Chemical Engineering at Swansea, 578
Chemical Engineering : Shell Department of, Cambridge, 287
Chemical Engineering, European Federation for : Second European Symposium on Chemical Reaction Engineering, 507
  Symposium on Distillation, 660
Chemical Industry, Society of : Messel Medal awarded to Viscount Chandos, 433
  Election of Sir Alexander Fleck as president for 1960-61, 737
Chemical Industry, Society of (Microbiology Group) : Symposium on Continuous Culture of Micro-organisms, 433
Chemical Industry, Society of (Pesticides Group) : Symposium on Fungicides in Agriculture and Horticulture, 507
Chemical Industry, Society of, and others : Symposium on the Industrial Chemistry of the Lower Olefines, 660
Chemical Journals : Russian, 891
Chemical Nature of the Cell Wall of the Green Algae, *Codium*, *Acetabularia* and *Halicoryne* (Yoshihiko Iriki and Tomoo Miwa), 178
Chemical Protection against Radiation Damage : An Alternative Mechanism for (Prof. Mark M Jones), 96
Chemical Reaction Engineering (European Federation for Chemical Engineering second European Symposium on), 507
Chemical Society : Corday-Morgan Awards for 1959 and 1960, 356
  Symposium on Physical, Chemical and Biological Methods of Study in High Molecular Weight Carbohydrates, 507
  Corday–Morgan Medal and Prize for 1958 awarded to Prof. C Kemball, 814
  To publish translations of *Zhurnal Fizicheskoi Khimii* (the *Russian Journal of Physical Chemistry*) and *Uspekhi Khimii* (*Russian Chemical Reviews*), 891
Chemical Society and the Royal Institute of Chemistry Joint Annual Meetings to be held in Belfast, 286
Chemical Society, and others · Symposium on the Industrial Chemistry of the Lower Olefines, 660
Chemical Society (American) : Monograph Series No. 137, The Physical Chemistry of Electrolytic Solutions (Prof. Herbert S. Harned and Prof. Benton B. Owen), third edition, *review* by Dr J. N. Agar, 274
Chemical Society, American (Fermentation Subdivision), and others : International Symposium on Fermentation, 14
Chemical and Biological Action of Radiations, *review* by Dr W. Anderson, 202
Chemical and Biological Methods (Physical,), of Study in High Molecular Weight Carbohydrates (Chemical Society Symposium on), 507
Chemical and Serological Relationships of certain Bacterial Polysaccharides containing Sialic Acid (Prof Guy T. Barry, Tien-Hu Tsai and Francis P Chen), 597
Chemicals (Toxic), in Agriculture and Food Storage : Use of (Appointment by the Minister of Agriculture, Fisheries and Food, with the Minister for Science, the Secretary of State for Scotland and the Minister of Health of a Research Study Group to consider the), 578
Chemistry : Harrison Memorial Prize for Research in, 14
  Inorganic (University of Toronto Symposium on), 433
  Ramsay Memorial Fellowships in, 432
Chemistry, Royal Institute of : Research Diploma for work in Pure and Applied Chemistry, 285
Chemistry, Royal Institute of, and the Chemical Society : Joint Annual Meetings to be held in Belfast, 286
Chemistry, Royal Institute of, and others Symposium on the Industrial Chemistry of the Lower Olefines, 660
Chemistry of Nuclear Power (Dr. J. K Dawson and Dr G. Long), *review* by Prof W. Murgatroyd, 4
Chemistry (Industrial), of the Lower Olefines (Chemical Society, the Institute of Petroleum, the Royal Institute of Chemistry and the Society of Chemical Industry Symposium on), 660
Chemistry (Organic) : Principles of (Prof. T. A. Geissman), *review* by Dr C. B. Reese, 131
Chemistry (Physical), of Electrolytic Solutions (Prof. Herbert S Harned and Prof. Benton B. Owen), third edition, *review* by Dr. J. N. Agar, 274
Chemistry (Pure and Applied) : Research Diploma for work in (Royal Institute of Chemistry), 285
Chemistry (Seventeenth Century) . Robert Boyle and (Dr. Marie Boas), awarded the Pfizer Prize of the History of Science Society, 660
Chemistry (Theoretical) : Summer School in (University of Oxford), 582
Chemistry and Non-Medical Uses . Antibiotics, their (edited by Dr. Herbert S. Goldberg), *review* by Prof. Harold Raistrick, 797
Chemistry and Refining (Petroleum) : Advances in (edited by Kenneth A. Kobe and John J. McKetta, Jr), *review* by Prof. F. Morton, 201
Chemists (Oil and Colour), Association of Twelfth Technical Exhibition, 286
Chen, Francis P., and others · Chemical and Serological Relationships of certain Bacterial Polysaccharides containing Sialic Acid, 597
Cherries (Sour) : An Anthocyanin-decolorizing System in (Prof. J. P. Van Buren, D. M. Scheiner and Prof. A C Wagenknecht), 165
Chester, Dr. G V. : Electron–Phonon Interactions in Solids, 586
Chichester, Prof. C. O., and others · Formation of Carotene *in vitro*, 687
Chick Feeding in the Wandering Albatross *Diomedea exulans* Linnaeus (W. L. N Tickell), 116
Chicken Collection of Urine and Faeces from the (Dr M. H. Fussell), 332
Chicken Antibody (Immune) Haemolytic Properties of (Prof. B. D. Janković and Dr K. Isaković), 322
Chicken Embryo Fibroblasts . Effect of Kinetin on Glucose Metabolism of (Dr S. Halevy and Lydia Avivi), 388
Chickens (Cholesterol-fed) : A Substance in Lingcod Liver Oil which prevents Hypercholesterolaemia in (J. D. Wood and Jacob Biely), 473
Children . Histamine Sensitivity in, after *Pertussis* Infection (Dr. R. K. Sanyal), 537
  Mathematics and (Z. P. Dienes), 581
Children (School), in Africa, 658
Chimica Italiana (Società), and others . International Symposium on Fermentation, 14

Chimie Physique, Société de Conference on the Structure of Graphite and the Kinetics of its Reactions, 582
Chimiques et Biologiques (Actions), des Radiations (Collection dirigée par M. Haissinsky), Troisième Série, Radiolyse de Liquides organiques (Milton Burton), Polymérisations amorcées par les Radiations ionisantes (A. Chapiro et M. Magat), Effets des Rayonnements de grande énergie sur les Polymères (A. Charlesby) ; Quatrième Série, Les Peroxydes organiques en Radiobiologie (R. Latarjet et *al.*), *review* by Dr. W. Anderson, 202
Chirigos, Dr. Michael A , and others : Immunity of Mice surviving Systemic Leukaemia (*L*1210) to Antifolic Resistant Variants of the Disease, 219
Chloramphenicol . A New Metabolite of (W. A. Dill, E. M. Thompson, R. A. Fisken and A. J. Glazko), 535
Chlorella vulgaris · Biosynthesis of Chlorophylls *a* and *b* in (Dr. W. Brzeski and Dr. W. Rucker), 922
Chloride : Variations in the Plasma-Level of, in Hatchery-reared Yearly Atlantic Salmon during Parr–Smolt Transformation and following Transfer into Sea-Water (Prof Arthur H. Houston), 632
Chloride (Mercuric) : Ultrasonic Velocities in Aqueous Solutions of Cadmium Iodide and (S V. Subrahmanyam), 371
Chloride (Sodium) Crystals : Evaporation Figures on the Surface of (Gy. Turchányi and T. Horváth), 601
Chlorogenic Acid of Lettuce Seeds (Dr. Warren L Butler), 856
Chlorophylls *a* and *b* in *Chlorella vulgaris* : Biosynthesis of (Dr. W Brzeski and Dr. W Rucker), 922
Chloroplast Development in *Euglena* · Fluorescence Studies of (Dr. H. T. Epstein, E. Boy de la Tour and Dr. Jerome A. Schiff), 825
Chloroplast Lipids · Hydrogenation of, by Rumen Bacteria (Dr. D. E. Wright), 546
Chloroplasts (Isolated) · Properties and Solubility of Phenolase in (A. M. Mayer and J. Friend), 464
Chlorpromazine : Effect of, on Tissue Metabolism *In vitro* (Dr. J. Kozák, Dr. A. Zeleny and N. Lang), 107
Chlorpromazine and Dihydroergotamine : Fall in Haematocrit in Sheep after Treatment with (Dr A. W. Turner and V Elizabeth Hodgetts), 43
Cholesterol-fed Chickens · A Substance in Lingcod Liver Oil which prevents Hypercholesterolaemia in (J D Wood and Jacob Biely), 473
Cholesterosis and Lipidosis of Rats maintained on an Atherogenic Diet : Modification of (Dr. N. R. Di Luzio), 616
Choline 2,6-Xylyl Ether Bromide : Powerful Adrenergic Neurone-blocking Agents related to (A L. A. Boura, G G. Coker, F. C. Copp, W. G. Duncombe, A R. Elphick, A. F. Green and A. McCoubrey), 925
Cholinesterase Activity (Muscle) Effect of Testosterone Propionate and Insulin on (A. N Granitsas, N Dede and Dr. A. J Philippu), 320
Chorioallantoic Membrane Lesions produced by Inoculation of Adult Fowl Leucocytes (Dr. Georgiana Boyer), 327
Chorionic Gonadotropin : Use of, to prevent Early Embryonic Mortality in Temporarily Fasted Mice (T. J. McClure), 622
Choroid Plexus and Ciliary Process Tissue · Comparative Adenylic Acid Deaminase Activity in (Prof Morton B Waitzman), 388
Chorus' ('Dawn) Effect of Latitude on the Diurnal Maximum of (Joseph H. Pope), 87
Choudhury, B. K Experimental Test of Verwey and Overbeek's Theory, 308
Chowdary, Y. B. K Algology /Algal Ecology), 820
Christie, Dr. Robert W., and others : Adrenocortical Function after Prolonged Salt Restriction in Hypertension, 110
Christmas Lecture of the Institute of Welding (Prof H. O'Neill), 14
Chromatograms . Cathode-Ray Presentation of (R. P. W Scott), 312
Chromatography · Clathrate Compounds in (Prof. W. Kemula and D. Sybilska), 237
Chromatography of Xanthene Dyes (Dr. Kenneth B. Taylor), 243
Chromatography (Carbohydrate) · Benedict's Solution as a Developer in (Roderick P Murphy), 455
Chromatography (Electro-) . A Synergic Method of Carrying out Continuous (Dr. S R. Caplan), 378
Chromatography (Gas) Purification of Metals by (Dr. F E. DeBoer), 915
  Separation Factors in (W. A. Wiseman), 841
Chromatography (Gas), of Pyrolytic Products . Identification of the Structure of Non-volatile Organic Substances by (Dr. Jaroslav Janák), 684
Chromatography (Gas–Liquid) Effect of Flow-Rate and Sample-Size on Column Efficiency in (Prof. Richard A. Bernhard), 311
Chromatography (Liquid–Gas) : Separation of the Hypnotic Potentiating Principles from the Essential Oil of *Acorus calamus* L. of Indian Origin by (Ross M Baxter, P. C Dandiya, S I. Kandel, A. Okany and Prof. G C. Walker), 466
Chromatography (Paper), of Acidic Carbohydrates (Dr. David A Rees), 309
Chromatography (Reversed Phase-Partition) : Separation of Uranium by (A. G. Hamlin and B J. Roberts), 527
Chromatography (Serum), on Columns connected to a Common Source of Buffer Gradients (A. G. M. Marr and C M. Gilbo), 853
Chromatography Columns (Gas–Liquid) : Formation of Volatile Compounds on (Margaret E. Kieser and D. J. Sissons), 529
Chromium : Oscillographic Investigation of Electrodeposition of (Hideya Okada, Kenji Nakamura and Takeo Ishida), 377
Chromoexcretion : Early Injury of, after Total Irradiation of Rats (Zdenek Dienstbier and Oskar Andrysek), 630
Chromosomes : The Secondary Pairing of Bivalents with Genetically Similar (Dr. Ralph Riley), 751
Chromosomes of South American Amphibians (Prof. Francisco A. Saez and Nadir Brum), 945
Chronically Ingested Radiostrontium : Effectiveness of Dietary Substances in reducing the Retention of—Studies with Tannin (Prof. R. H. Wasserman and Dr C. L. Comar), 629
Chrysotile Asbestos : Dissolution of, in Water, Acid and Alkali (S. G. Clark and Dr. P. F. Holt), 237
Churchill College, Cambridge : Appointment of Dr. Kenneth McQuillen as College lecturer in biochemistry, 433
Churchill Hospital, Oxford : Establishment by the Medical Research Council (by agreement with the United Oxford Hospitals) of the Blood Coagulation Research Unit, 215
Chymotrypsin : Casein labelled with Iodine-131 as a Substrate for the Measurement of Trypsin and (Dr. Bernard J. Katchman, Dr. Robert E. Zipf and Dr. George M. Homer), 238
Cigarette Smoke : Some Phenolic Constituents of (Dr. W. Carruthers and Dr R. A. W. Johnstone), 762
Ciliary Process Tissue : Comparative Adenylic Acid Deaminase Activity in Choroid Plexus and (Prof. Morton B. Waitzman), 388
Cirrhotic Liver : Fibrinolytic Activity of (Dr. Tage Astrup, J. Rasmussen, A. Amery and H. E. Poulsen), 619
Citric Acid Concentration in the Rat Kidney : Effect of Parathyroid Extract on (A. Komárková, J. Vostál and V. Pacovsky), 173
Civil Engineering at Manchester, 212
Civil Life in Britain : Science in, 583
Clagett, Marshall : The Science of Mechanics in the Middle Ages, *review* by Prof. E. J. Dijksterhuis, 491
Clark, A. : Scanning of Paper Electrophoretograms after Protein Dyeing with Bromocresol Green, 243
Clark, Dr. B., and Hubscher, Dr G. : Biosynthesis of Glycerides in the Mucosa of the Small Intestine, 35
Clark, Colin : Agricultural Research in India, *review*, 414
Clark, S. G., and Holt, Dr. P. F : Dissolution of Chrysotile Asbestos in Water, Acid and Alkali, 237
Clark-Lewis, Dr. J. W. · Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 212
Clarke, G. R. : The Study of the Soil in the Field, fourth edition, *review* by Dr. R. M. S Perrin, 2
Clarke, W. J., and others · Mid-Tertiary Stratigraphical Palaeontology, 447
Clarkson, Dr. B. L : Vibrations (Fatigue of Aircraft Structures due to Vibrations set up by Jet Noise), 900
Class of Hydroperoxides formed under the Influence of Ionizing Radiations : Organic Hydroxy-Hydroperoxides, a (Dr. George Scholes and Prof. Joseph Weiss), 305
Classical Greece : Mycenaean and, *review* by Dr. Hugh Plommer, 493
Classical Languages in Oxford Entrance Requirements, 660
Clathrate Compounds in Chromatography (Prof. W. Kemula and D. Sybilska), 237
Clay Minerals . Removal of Fixed Ammonium from, by Cation Exchange Resins (Prof A. D. Scott, A. P. Edwards and Prof. J. M. Bremner), 792
Clay Minerals in Sediments (Clay Minerals Group of the Mineralogical Society Discussion on), 286
Clayton (James) Prize for 1959 of the Institution of Mechanical Engineers awarded to C. Bernard Dicksee and Prof. G. Fernie Mucklow, 814
Clearances of Endogenous α-Ketoglutaric and Pyruvic Acid in Man (Dr. Eman Zelníček), 928
Clegg, John : The Freshwater Life of the British Isles, second edition, *review* by Dr. W. J. Rees, 801
Cleland, Dr. Robert : Auxin-induced Methylation in Maize, 44
Cleveland, Dr. L. R. : Host Influence on Parasite Physiology (Effects of Insect Hormones on the Protozoa of *Cryptocercus* and Termites), 897
Climate . Weather and (Dr. Clarence E. Koeppe and Dr. George C. de Long), *review* by G. A. Bull, 720
Climate (Upland), and Land Usage, with special reference to Highland Britain (Third Symposium on Aspects of Agricultural Meteorology), (University College, Aberystwyth), 737
Cline, Dr. Carl F., and Sands, Dr. Donald E. : A New Silicon Boride, SiB_4, 456
Clinical Aspects of Nutrition (Prof R. A. McCance and the Department of Experimental Medicine, Cambridge, Course on), 507
Clinical Biochemists, Association of, and the Biochemical Society : Symposium on the Formation and Breakdown of Haemoglobin, 737
Clinical Research Board : Appointment of Prof. E. J. Wayne as chairman, 433
Close, R. : Free Amino-acids of some Fungi, 609
Clostridia : Observations on the Nagler Reaction of some (Dr. A. T. Willis), 943
Closure (Eye) : Relation of Eye Dominance and (S. T. Chan and Prof. K. S. F. Chang), 539
Clot Lysis : Mechanism of (Prof. N. K. Sarkar), 624
Clough Memorial Research Fund of the Edinburgh Geological Society (Grants for 1960-61), 506
Clover (Subterranean), *T. subterraneum* : Effect of Micro-organisms on the Development of Roots and Root Hairs of (A. D. Rovira and G. D. Bowen), 260
Coagulation (Blood) : Paradoxical Effect of Magnesium Ions on (R. G. Huntsman, B. A. L. Hurn and Dr. H Lehmann), 852
Coal Board, National Research on Coal Utilization, 431
Coal Board, National (Mining Research Establishment of the), in consultation with the Building Research Station (D.S I.R.) : Conference on Non-Metallic Brittle Materials—Proceedings, Mechanical Properties of Non-Metallic Brittle Materials (edited by W. H. Walton), *review* by Dr David Train, 344
Coal Utilization Research Association (British) : Symposium on Aerodynamic Capture of Particles, 664
Coal and Oil : Gasification of, 431
Coastlines : Changing, *review* by Prof. L. Dudley Stamp, 564
Coasts · Beaches and (Dr. C. A. M. King), *review* by Prof. L. Dudley Stamp, 564
Coates, Sir Eric : Appointed a member of the Commonwealth Scholarship Committee in the United Kingdom, 505
Cobalt Complexes : New Univalent, of the $[Co^{1}(CN)_{5}X$ Type] (Dr. Nobufumi Maki), 682
Cobalt and Zinc Ions : Influence of, on the Growth and Porphyrin Production of *Mycobacterium tuberculosis avium* (Dr. D. S. P. Patterson), 57
Cobaltic Complexes catalysed by Adsorption : Substitution Reactions of (A. A. Vlček and J. Kuta), 95
Cockroach (American), *Periplaneta americana* L. : Spectrophotometric Measurement of Cytochromes in the Red and the White Muscles of the (Tsutomu Nakatsugawa), 85
Coconut Palm : Presence of *Aphelenchoides cocophilus* in the Roots of *Cocos nucifera*, the (Dr. D. W. Fenwick and S. B. Maharaj), 259
Cocus nucifera, the Coconut Palm . Presence of *Aphelenchoides cocophilus* in the Roots of (Dr. D. W. Fenwick and S. B. Maharaj), 259
Cod (*Gadus callarius* L.) Muscle : Water Content of (R. M. Love), 692
Codium, *Acetabularia* and *Halicoryne* . Chemical Nature of the Cell Wall of the Green Algae (Yoshihiko Iriki and Tomoo Miwa), 178
Codling Moth Females (*Cydia pomonella* L.) caught in Bait and Light Traps : Physiological Age of (P. W. Geier), 709

Coefficient (Negative Temperature) : Zone of, in Hydrocarbon Oxidation (K. C. Salooja), 32
Coenzyme I-Content of Spleen after Freezing : Decrease in (Mollie Luscombe), 691
Coetzee, Prof. J. N., and Sacks, T. G. : Intrastrain Transduction in *Proteus mirabilis*, 869
Co-factors in *Hevea brasiliensis* Latex Serum (A. I. McMullen), 103
Coggins, R. A. (Whiting, Dr. G. C., and) : Formation of L-Xylosone from Ascorbic Acid, 843
Cohen, A., and Cohen, L : Estimation of the Cellular Lethal Dose and the Critical Cell Number for the *C3H* Mouse Mammary Carcinoma from Radiosensitivity Studies *in vivo*, 262
Cohen, L. (Cohen, A., and) Estimation of the Cellular Lethal Dose and the Critical Cell Number for the *C3H* Mouse Mammary Carcinoma from Radiosensitivity Studies *in vivo*, 262
Cohen, L. A. (Glenner, G G, and) : Histochemical Demonstration of a Species-Specific Trypsin-like Enzyme in Mast Cells, 846
Cohen, Dr. Morris : Awarded the Willis Rodney Whiting Award, 285
Coil Spring Federation Research Organization : New Laboratories to be opened by Sir Harry Melville, 660
Coker, G. G., and others : Powerful Adrenergic Neurone-blocking Agents related to Choline 2,6-Xylyl Ether Bromide, 925
Cold : Human Adaptation to (Dr. Laurence Irving), 572
Cold Auto-Antibodies of Acquired Haemolytic Anaemia : Individual Specific Nature of the (Dr. T. N. Mehrotra), 323
Cold-Stressed Rats : Effects of Reserpine, Serotonin and Vasopressin on the Survival of (R. Michel Zilberstein), 249
Cold Temperate Zone (Southern) : The Biology of the (Royal Society Discussion on), 204
Cole, H H, and Cupps, P. T. (edited by) : Reproduction in Domestic Animals, Vol. 2, *review* by Sir John Hammond, 492
Coleman, L. E, and Bork, J. F. : At the Ninth Canadian High Polymer Forum (The Reactivity Ratios of N-Vinyl Oxazolidone and N-Vinyl Pyrrolidone with Vinyl Monomers), 359
Colibris : La Vie des—les Trochilidés (Ariane Martin et Anne Musy), *review* by J. D Macdonald, 67
Collaboration (United Nations), in the Sociological Sciences, 561
Collagen (Decalcified Human Dentin) : Peptides obtained from Partial Hydrolysis of (Dr. C. C. Solomons), 101
Collagens and Gelatins : Ester-like Groups in Different (Dr Jake Bello), 241
Collecting Fossils, Minerals and Rocks (British Museum (Natural History), Instructions for Collectors, No. 11), seventh edition, 432
Collection of Urine and Faeces from the Chicken (Dr. M. H. Fussell), 332
College (Technical) : The Computing Laboratory in the (Hatfield Technical College Conference on), 507
Collenette, Cyril L. · *Obituary* by Alfred Leutscher, 211
Collinson, A. J. L., and others : Self-quenching Geiger Counters containing Mixtures of Permanent Gases, 369
Colloidal Gold : Spiral Growth of, and Moiré Fringe (Prof. E. Suito and N. Uyeda), 453
Colman, John S. : A Possible Function of Planktonic Photophores, 112
Colombo Plan : Appointments, 660
Colonial Office (Commonwealth Relations Office) : Commonwealth Scholarship and Fellowship Plan, 272
  Report of the Commonwealth Education Conference, 490
Colorimetric Determination of Amino-acid Concentration (Dr. W. A. Vincent), 530
Colour Chemists (Oil and), Association of : Twelfth Technical Exhibition, 286
Colquhoun, W. P., and others : Effect of Small Doses of Alcohol on a Skill resembling Driving, 354
Columbia University : First Award of the Vetlesen Prize made to Prof. Maurice Ewing, 888
Column Efficiency in Gas-Liquid Chromatography : Effect of Flow-Rate and Sample-Size on (Prof. Richard A. Bernhard), 311
Columns connected to a Common Source of Buffer Gradients : Serum Chromatography on (A. G. M. Marr and C. M. Gilbo), 853
Columns (Gas–Liquid Chromatography) : Formation of Volatile Compounds on (Margaret E. Kieser and D. J. Sissons), 529
Comar, Dr. C. L. (Wasserman, Prof R. H, and) Effectiveness of Dietary Substances in reducing the Retention of Chronically Ingested Radiostrontium—Studies with Tannin, 629
Commercial Application of Gibberellic Acid to Hops (A. S. Nash and P. D. Mullaney), 25
Common Dogfish : Abnormalities in the Urinogenital System of the (Dr. A. S. Fuller and J. M Zacharov), 50
Commons, House of : Second reading of the Atomic Energy Authority Bill, 127
  Second reading of the Marshall Scholarships Bill, 271
  Second reading of the Commonwealth Scholarships Bill, 271
  Debate on Science in Civil Life, 583
Commonwealth Assistance in Training Teachers, 812
Commonwealth Bureau of Animal Health : Review Series No. 6, Fungal Diseases of Animals (Dr. G. C. Ainsworth and P. K. C. Austwick), *review* by J. E. Smith, 720
Commonwealth Bursaries Scheme : Royal Society and Nuffield Foundation (Awards), 212
Commonwealth Education Conference : Report of the (Commonwealth Relations Office), 490
Commonwealth Education and Development, 489
Commonwealth Fellowships : South Africa and, 893
Commonwealth Relations Office, Colonial Office : Commonwealth Scholarship and Fellowship Plan, 272
  Report of the Commonwealth Education Conference, 490
Commonwealth Scholarship Commission : Appointment of the Earl of Scarborough as chairman in the United Kingdom, 214, 505
  Appointment of members in the United Kingdom, 505
Commonwealth Scholarship and Fellowship Plan (White Paper on the), 272
Commonwealth Scholarships Bill : Second reading in the House of Commons, 271
Commonwealth Scientific and Industrial Research Organization (Australian) : *Rural Research in C.S.I.R.O.*, 28, Preventing Evaporation from Reservoirs (W. W. Mansfield), 581
Commonwealth (British) : The Wandering Scholar in the, 271
Communicable Diseases in School (United Nations, World Health Organization Report on), 736
Communication : Science and (Sir Edward Appleton), (British Association Granada Lectures on Communication in the Modern World), *review* by B. Silcock, 130
  Thoughts on, *review* by B. Silcock, 130
Communication in the Modern World (Granada Lectures of the British Association), *review* by B. Silcock, 130
Communities (Plant) : Association-Analysis in (D. J. Harberd), 53
Community (Socially Isolated) : Intelligence, Personality and Brain Rhythms in a (A. C. Mundy-Castle and G K. Nelson), 484
Comparative Adenylic Acid Deaminase Activity in Choroid Plexus and Ciliary Process Tissue (Prof Morton B. Waitzman), 388
Comparison of Rain-Gauges (G. A. Bull), 437
Competition (Calcium–Lithium), in Absorption by Plant Roots (Emanuel Epstein), 705
Complex (Biradical Molecular), *p*-Phenylenediamine-chloranil : Electron Spin Resonance Absorption of the (Dr. Y. Matsunaga and Prof. C. A. McDowell), 916
Complex (Embryo-Gametophyte), of *Pinus nigra* var. *austriaca* : Differentiation induced as Season Advances in the, using Indole Acetic Acid (Prof. Norman W. Radforth and Dr J M Bonga), 332
Complex Calcium Ferrite Phases : Two New (Stig Holmquist), 604
Complexes : Copper–Cellulose (D. S Belford and Prof. R D. Preston), 911
  New Univalent Cobalt, of the $[Co^{I}(CN)_{5}X]$ Type (Dr. Nobufumi Maki), 682
Complexes (Cobaltic), catalysed by Adsorption : Substitution Reactions of (A. A. Vlček and J. Kuta), 95
Complexes (Copper (II)), of Histamine and 3-Methyl Histamine (Dr. R. Leberman and Dr. B R. Rabin), 768
Complexes (Metal-Organic), formed during the Treatment of Wood with Metal Salts (C H. Bayley and Grace R. F. Rose), 313
Component (Neurotoxic), of the Venom of the Sea Snake, *Enhydrina schistosa* : Isolation of the (Jocelyn E. Carey and Dr. E. A. Wright), 103
Comportement des Pluviomètres : Sur le (Dr. L. Poncelet), 438
Composition in the Iron–Vanadium Sigma Phase : Variation of Magnetic Moment with (Dr. D. Parsons), 839
Composition (Polysaccharide), of Leaves (P. Andrews, Dr. L. Hough and B. Stacey), 166
Compounds (Aliphatic) · Dependence of Periodic Activation and Inhibition of Monoaminoxidase by, upon Chain-length (Dr. George C. Cotzias and Dr James J Greenough), 384
Compounds (Clathrate), in Chromatography (Prof. W. Kemula and D Sybilska), 237
Compounds (Fluorescent) Fluorescence and (Department of Chemical Technology of Bradford Institute of Technology Symposium on), 893
Compounds (Organic), in Ancient Sedimentary Rocks : Presence of Carbohydrates and other (J. G. Palacas, F. M. Swain and Prof. F. Smith), 234
Compounds (Unsaturated) : Effect of High-Energy Radiation on Mixtures of Vinyl or related Polymers with (B. J. Lyons), 604
Compounds (Volatile) : Formation of, on Gas—Liquid Chromatography Columns (Margaret E. Kieser and D. J. Sissons), 529
Computation and Automatic Control, 145
Computation, British Conference on Automation and (British Group for Computation and Automatic Control) : Annual General Meeting, 145
  Election of Officers for 1960, 145
Computer Federation, International, 285
Computer Societies, International Federation of : Academy of Sciences of the U S S.R to join the, 507
Computers (Digital), National Centre of Information on Automatic Programming of (Brighton Technical College), 214
Computing Laboratory in the Technical College (Hatfield Technical College Conference on), 507
Concentration of Strontium-90 in Human Diet in the United Kingdom : Relationship between the Rate of Fall-Out and the (Dr. J. D. Burton, G. M. Milbourn and Dr. R. Scott Russell), 498
Concentration (Amino-acid) : Colorimetric Determination of (Dr. W. A. Vincent), 530
Concentration (Citric Acid), in the Rat Kidney : Effect of Parathyroid Extract on (A. Komárková, J. Vostál and V. Pacovsky), 173
Concentration (Liquid), in Flow Studies with Porous Models : Optical Scanning of (Dr. E. R. Deutsch), 675
Concentration-dependent Diffusion : A Very General Class of Exact Solutions in (J. R. Philip), 233
Concentrations (Low External Potassium) : Resting Potentials in Isolated Frog Sartorius Fibres at (Dr. Roderick P. Kernan), 471
Concentrations (Plasma Antihaemophilic-Factor), in the Australian Aborigine and in Conditions associated with Hyperglobulinaemia (W. R. Pitney and M. H Elliott), 397
Concepts (Biological), before Darwin, *review* by Sir Gavin de Beer, 2
Conditioned Avoidance Behaviour induced by Low-Dose Neutron Exposure (Dr John Garcia and Dr. Donald J. Kimeldorf), 261
Conditioned Lines of Flax (Dr. A. Durrant and H. Tyson), 60
Conditions associated with Hyperglobulinaemia · Plasma Antihaemophilic-Factor Concentrations in the Australian Aborigine and in (W. R. Pitney and M. H Elliott), 397
Conditions (Mild) · Synthesis of Phthaloyl Amino-Acids under (G. H. L. Nefkens), 309
Conductivity of Aqueous Sodium Stannate Solution (P. T. Good), 840
Conductivity (Surface-controlled Bulk), in Organic Crystals (Dr. H. Kallmann and Dr. M. Pope), 753
Configuration of Inositol Phosphate in Liver Phosphatidyl Inositol (Dr. J. N. Hawthorne, P. Kemp and R. B. Ellis), 37
Configuration of Poly-L-Tyrosine : Optical Rotation and (Dr. James D. Coombes, Dr. E. Katchalski and Prof. Paul Doty), 534
Configuration (Stereo-) of 2,4-Decadienols isolated from Oils containing Linoleic Acid (G. Hoffmann and J. G Keppler), 310
Congenital Malformations (International Medical Congress, Ltd., first International Conference on), 507
Conjugates in Food : Release of Iron from (Rona Sanford), 533
Conjugates (Œstrone–Protein) : Antigenicity of (Dr. L. Goodfriend and Prof. A H. Sehon), 764
Connective Tissues : Presence of Sialic Acid in (A. A. Castellani, G. Ferri, L. Bolognani and V Graziano), 37

Conning, A. M. : Dielectric Devices (Highspeed Switching Characteristics of the Diodes), 361
Conquest of Space (Prof A Masevich), 286
Consequences of Expansion of the Earth . Some (Dr J. Tuzo Wilson), 880
Conservation Postgraduate Diploma Course in, at University College, London, 814
Conservation in America and Africa, *review* by Prof. L. Dudley Stamp, 345
Conservation of Natural Resources (edited by Guy-Harold Smith), second edition, *review* by Prof. J. Dudley Stamp, 345
Conservation of Natural Resources (Richard C. Haw), *review* by Prof. L. Dudley Stamp, 345
Conservation of Nature and Natural Resources, International Union for : Bulletin 8, Protection of Nature in the Soviet Republic of Azerbaijan (G. Aliev), 580
Consolidation (Soil) · A Sidewall Friction Effect during (Dr. Carl B. Crawford), 371
Constant Ionosphere Height for Audiofrequency Propagation (F. Hepburn), 599
Constituents (Phenolic), of Cigarette Smoke . Some (Dr. W. Carruthers and Dr. R. A W. Johnstone), 762
Consumption of Energy in Great Britain · Production and (Prof. R. J. Sarjant), 896
Consumption (Oxygen), of Hyperthyroid Rats : Effect of Adrenaline and Insulin upon the (R. L. Himsworth), 694
Containment Buildings (Nuclear Reactor), and Pressure Vessels (Department of Mechanical, Civil and Chemical Engineering, Royal College of Science and Technology, Glasgow, Symposium on), 660
Contemporary Physics, Nos 1 and 2, 658
Conti, S. F., and Naylor, Prof H. B. : Study of Life-cycle of *Schizosaccharomyces octosporus* by means of Ultra-thin Sectioning and Electron Microscopy, 633
Continental Drift (Prof J A. Jacobs), 231
Continuous Culture of Micro-organisms (Microbiology Group of the Society of Chemical Industry Symposium on), 433
Continuous Electrochromatography . A Synergic Method of Carrying out (Dr S R. Caplan), 378
Contractile Properties (Rapid), of Isolated Mammalian Arteries (C. J. Dickinson), 620
Control of African Wild Animals (Dr. H. K. Buechner, Dr. A. M Harthoorn and Dr. J. A Lock), 47
Control of Radioactive Wastes, 199
Control (Automatic) : Computation and, 145
  Value of Instruments and, to the Smaller Firm (Society of Instrument Technology Conference on), 737
Control (Feedback), of Tryptophan Biosynthesis (Dr. C. H Doy and A. J. Pippard), 941
Control (Genetic), of Protein Synthesis in Cell-free Extracts of *Neurospora crassa* . Mediation of the (S. D. Wainwright), 314
Control (Hormonal), of Moulting in Amphibians (C. Barker Jørgensen and Liv Olesen Larsen), 244
Control (Hormonal), of Secretion in the Oviduct of the Amphibia (Patricia D. B. Lodge and Dr. C. L. Smith), 774
Control (Thyroidal), of Radiophosphorus Metabolism in Salmon (P. N. Srivastava), 621
Controlling the Temperature of Insect Neurosecretory Cells *in situ* : A Method of (R. H. J. Brown and Janet E. Harker), 392
Conurbations of Great Britain (T. W. Freeman), *review* by Prof. R. E Dickinson, 877
Convective-Turbulence Theory of Thunderstorms (Dr. N. Ramalingam), 900
Cook, Dr. A. H. . Geological Implications of Recent Geophysical Work in the British Isles, 739
Cook, B. P. (Steward, E. G., and) : X-Ray Measurement of Thermal Expansion Perpendicular to the Layer Planes of Artificial and Natural Graphites, 78
Cook, Dr. Maurice, and Swainson, E : Awarded jointly the W. H A. Robertson Medal and Premium for 1959 of the Institute of Metals, 735
Coombes, Dr. James D., and others : Optical Rotation and Configuration of Poly-L-Tyrosine, 534
Co-operative Marketing Societies (Horticultural) : Working Party on (To be set up by the Minister of Agriculture, Fisheries and Food), 736
Co-ordination of Galactic Research (International Astronomical Union, Symposium No 7, Stockholm 1957), (edited by A. Blaauw, G. Larsson-Leander, N. G. Roman, A. Sandage, H. F. Weaver and A. D. Thackeray), *review*, 801
Co-ordination of Light and Electron Microscopy (Royal Microscopical Society and the Electron Microscopy Group of the Institute of Physics Discussion on), 660
Cope, Jackson I., and Jones, Harold Whitmore (edited with Critical Apparatus by) : History of the Royal Society (Thomas Sprat), *review* by Prof. E. N. da C. Andrade, 343
Copepod (Parasitic), of Mussels : A New Record of *Mytilicola intestinalis* Steuer, a (J Wickstead), 258
Copp, F. C., and others : Powerful Adrenergic Neurone-blocking Agents related to Choline 2,6-Xylyl Ether Bromide, 925
Copper Bands of *Helix pomatia* Haemocyanin : Decrease of the (K. Heirwegh and R Lontie), 853
Copper Biguanides : Crystal Spectrum of (Animesh Chakravorty and Dr. Sadhan Basu), 681
Copper–Cellulose Complexes (D. S. Belford and Prof. R. D. Preston), 911
Copper Chelates : Anti-Tumour Activities of (Dr. Kazuhiko Takamiya), 190
Copper (II) Complexes of Histamine and 3-Methyl Histamine (Dr. R. Leberman and Dr. B. R. Rabin), 768
Copper–Indium Eutectoid Alloy : Decomposition of the Beta–Phase in a (D. A. Moore, M White and Dr. D. R. F. West), 454
Copper Sulphate Monohydrate : Recrystallization of Amorphous (G. A. Specken and Prof. K. J. McCallum), 758
Copper and Protein Moieties of Ceruloplasmin : Turnover of the (Prof. David Gitlin and Charles A. Janeway), 693
Copulations (Successive) : Fertilization of Eggs of the Desert Locust from Spermatozoa from (Philip Hunter-Jones), 336
Corchorus olitorius L. (Tossa) x *C. capsularis* L. (White) : First Successful Hybrid between the Two Jute-yielding Species (Ahmad Shamsul Islam and A. Rashid), 258
Corday-Morgan Awards for 1959 and 1960 (Chemical Society), 356
Corday–Morgan Medal and Prize for 1958 of the Chemical Society awarded to Prof. C. Kemball, 814
Core (Earth's) : Temperatures within the (Prof. J. A Jacobs), 521
Cornell University Center for Radiophysics and Space Research (Dr. J. A. Ratcliffe), 77
Cornforth, Rita H., and others : Stereospecificity of Enzymic Reactions involving Mevalonic Acid, 923
Corona · Effect of, on Travelling Waves (Dr. M. Ouyang), 524
Correlation of Audio-Frequency Electromagnetic Radiation with Auroral Zone Micropulsations (Dr. J Aarons, G. Gustafsson and A Egeland), 148
Correlation between the Electrolyte and Water Content of the Organs and Hypertension after Administration of Corticosteroids (Prof. L. Laszt), 695
Correlation of Loss of Photoreversibility of Ultra-violet-induced Mutations with Deoxyribonucleic Acid Synthesis (Dr. F. L Haas and Dr. C O. Doudney), 637
Correlation between Synthesis of Nucleic Acids and Proteins in Denervated Muscle : Lack of (R Zák and Dr. E. Gutmann), 766
Corrosion Inhibition and the Zero Charge Potential of Metals (Dora M. Brasher), 838
Corrosion Science Society : Foundation of the, 579
Corrosion (Bedrock), and Drainage Initiation by Seepage Moisture on a Gritstone Escarpment in Derbyshire (B. T. Bunting), 447
Cortesao, Dr. Armando . Awarded a Victoria Medal of the Royal Geographical Society, 735
Cortex (Brain) : Effect of Cations on γ-Aminobutyric Acid Levels in Slices of (Dr. R. Rybová), 542
Corticosteroids . Correlation between the Electrolyte and Water Content of the Organs and Hypertension after Administration of (Prof. L Laszt), 695
Coryndon Memorial Museum, Nairobi : Annual Report for 1958, 285
Cosmic Asymmetry : Pasteur and (Prof J B S. Haldane), 87
Cosmic-Ray Ages · Calculation of, in the Iron Meteorites 'Carbo' and 'Treysa' (Dr. H. Voshage and Dr. H. Hintenberger), 88 ; (Dr. Royal R. Marshall), 89
Cosmic Rays at Sea-Level : Momentum Spectrum of (F. Ashton, G. Brooke, M. Gardener, P. J. Hayman, D. G. Jones, S. Kisdnasamy, J. L. Lloyd, F. E Taylor, R. H. West and A. W. Wolfendale), 364
Cosmic-Rays (Low-Energy) : Solar Radio Bursts and (Dr. A. R. Thompson and Dr. A. Maxwell), 89
Cota-Robles, E., and others : Antigens of Spheroplast Membrane Preparations from *Escherichia coli* B, 57
Cott, Dr. Hugh B · Uganda in Black and White, *review* by M. C. Burkitt, 567
Cotton, F. H. (Ceresa, R. J , and) : At the Ninth Canadian High Polymer Forum (The Mechanico–Chemical Modification of High Polymers), 359
Cotton Improvements : The Application of Genetics to (Sir Joseph Hutchinson), *review* by Prof. S C Harland, 494
Cotton Leaves : Effect of Infection by *Xanthomonas malvacearum* (E.F.S.) Dowson on Respiration-rate of (Dr. H. M. Hassan and K. A. Sabet), 177
Cotton and Genetics : *review* by Prof. S C. Harland, 494
Cottrell, Prof. T. L. : Elected a Fellow of the Royal Society of Edinburgh, 734
Cotzias, Dr. George C., and Greenough, Dr. James J. : Dependence of Periodic Activation and Inhibition of Monoaminoxidase by Aliphatic Compounds upon Chain-length, 384
Coulson, Dr. W. F. : 17-Oxosteroids of Pregnant Ewes' Urine, 612
Council for British Archaeology (Research Committee on Industrial Archaeology) : Conference on Industrial Archaeology, 357
Counter : An Automatic Fish Egg (B. B. Parrish, I. G. Baxter and M. J. D. Mowat), 777
Couper, R A. : The Biology of the Southern Cold Temperate Zone, 205
Coupland, Prof. R E. : Elected a Fellow of the Royal Society of Edinburgh, 734
Couramin : Effect of, on the Growth of *Rhodotorula rosea* Cultures (J. S. Knypl and J. S. Szopa), 933
Course on the Clinical Aspects of Nutrition (Prof. R A. McCance and the Department of Experimental Medicine, Cambridge), 507
Course on Micro- and Semi-microchemical Methods (Norwood Technical College, London), 737
Course for Science Teachers (Shell International Petroleum Co), 737
Course of Lectures on Foundry Sands (Borough Polytechnic, London), 286
Course of Lectures on Lubrication and Lubricants (Borough Polytechnic, London), 286
Course of Lectures on Reactor Fuel Element Technology (Imperial College of Science and Technology, London), 215
Course of Lectures on Spectroscopic Methods of Pharmaceutical Analysis (Brighton Technical College School of Pharmacy), 76
Course of Lectures on Variety Reduction in Engineering (Borough Polytechnic, London), 286
Course (Postgraduate Diploma), in Conservation (University College, London), 814
Course (Refresher), on Science in Schools (Department of Extra-Mural Studies and Education of King's College, Newcastle-upon-Tyne, in association with the North-Eastern Association of the British Federation of University Women), 286
Courses in Advanced Technology (London and Home Counties Regional Advisory Council for Technological Education Bulletin on), 506
Courses on Nuclear Energy for Engineers and Technical Industrialists (European Nuclear Energy Agency of the Organization for European Economic Co-operation), 506
Coursey, P. R : *Obituary*, 429
Courts, Dr. A : Occurrence of Riboflavin in Sturgeon Skin, 463
Cousins, F. B. (Cadell, P. B , and) : Urinary Selenium and Dental Caries, 863
Cowgill, M. G , and others : Oxidation of Titanium–Iron Alloys, 304
Cox, Elsie A., and others *In vitro* Culture of *Musa balbisiana* Colla Embryos, 403
Cox, Prof. E. G. : Appointed secretary of the Agricultural Research Council, 144 ; work of, 144
Cox, Sir Harold Roxbee : Appointed chairman of the National Council for Technological Awards, 286
Cox, Dr. L. R , and Rees, Dr. W. J. : A Bivalve Gastropod, 749
Crab (Pinnotherid) : Abbreviated Development in a (Dr. I. Goodbody), 704
Crab (River), *Potomon* (*Potamonautes*) *perlatus* (M.Edw.), in Rhodesian Trout Streams : Quantitative Estimations of Populations of the (Peter St J. Turnbull-Kemp), 481

Crabs (Spider), of the Genus *Macropodia* : Swimming in (R. G. Hartnoll), 181

Crack (Stress-Corrosion) : Flow of Electrolyte within a Propagating (J. M. West), 92

Craik (Kenneth) Research Award for post-graduate research, preferably in physiological psychology (St. John's College, Cambridge), 736

Cranshaw, Dr. T. E., and Schiffer, Dr. J. P. : Experiments to Test Einstein's Principle of Equivalence, 653

Crary, Dr. Albert P. : Awarded the Cullum Geographical Medal of the American Geographical Society, 12

Crawford, Dr. Carl B. : A Sidewall Friction Effect during Soil Consolidation, 371

Creep in Wood : Effect of Moisture Changes on (L. D. Armstrong and R. S. T. Kingston), 862

Cress, Edgar A., and others : Rare-Earth Fatty Liver, 480

Crichton, J. A. : Elected a Fellow of the Royal Society of Edinburgh, 734

Crisler, Lois : Arctic Wild, *review* by R. W. Hayman, 64

Crisp, Dr. D. J., and Ryland, J. S. : Influence of Filming and of Surface Texture on the Settlement of Marine Organisms, 119

Cristae of the Elasmobranch *Raja clavata* . A Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the, in Terms of Directional Sensitivity (Prof. O. Lowenstein and J. Wersall), *errata*, 76

Criterion of Purity : Spectrum of Delayed Fluorescence in Phenanthrene Vapour—a (Dr. B. Stevens, E. Hutton and Prof. G. Porter), 917

Critical Cell Number for the *C3H* Mouse Mammary Carcinoma : Estimation of the Cellular Lethal Dose and the, from Radiosensitivity Studies *in vivo* (A. Cohen and L. Cohen), 262

Crompton, Dr. A. W. : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 212

Crone, W. Reed, and others · Observations of Ionization Induced by Artificial Earth Satellites, 520

Croom, Sheila, and others : Variation of Electron Density in the Ionosphere with Magnetic Dip, 902

Crooners ? : Dons or (Sir Eric Ashby), (British Association Granada Lectures on Communication in the Modern World), *review* by B. Silcock, 130

Crop ? : Water Hyacinth—a Curse or a (N. W. Pirie), 116

Crop Protection : Twelfth International Symposium on (Agricultural College of the University of Ghent), 286

Crosby, Dr. P. : Measurement of Visual Range, 438

Cross, L. E. : Dielectric Devices (Paramagnetic Amplification), 360

Crosses (*F*+ × *F*—), in *Escherichia coli* K12 : Role of *Hfr* Mutants in (P. Reeves), 265

Crouch, Prof. Marshall . Appointed deputy science officer at the United States Embassy in Tokyo, 657

Crude Tar : Growth of Iron Bacteria in (P. H. Garnett), 942

Crustacean Moulting Hormone : Attempted Extraction of, from Isolated Y-Organs (Dr Peter Karlson and Dorothy M. Skinner), 543

Crustal Distortion (Tertiary) in Mid-Argyll : Evidence for (Dr. J. L. Knill), 234

Cryptococcus neoformans : Infra-Red Spectra of Capsular Polysaccharides from Thirteen Strains of (Dr. H. H. Gadebusch), 610

Cryptomys hottentotus Lesson, 1826 : Albinism in (Peter St. J. Turnbull-Kemp), 551

Crystal Spectrum of Copper Biguanides (Animesh Chakravorty and Dr. Sadhan Basu), 681

Crystal Structure of Mellitic Acid (Dr. A Bezjak and Prof. D. Grdenić), 756

Crystal Structure of L-Serine Phosphate (G. H. McCallum, Prof. J. Monteath Robertson and Dr. G. A. Sim), *errata*, 14

Crystalline Cytochromess from *Porphyra tenera* : Preparation of (Eijiro Yakushiji, Yasutomo Sugimura, Ichiro Sekuzu, Ichiro Morikawa and Prof. Kazuo Okunuki), 105

Crystallites (Electron-dense), in Nuclei of Human Amnion Cells infected with Measles Virus (Richard F. Baker, Prof. Irving Gordon and Fred Rapp), 790

Crystallization of Non-Racemic Mixtures of the Isomers of Serine (Prof. Martin L. Minthorn, jun., and Roger E. Koeppe), 459

Crystallographer's Tool-Chest of Mathematics, *review* by Dr. A. R. Stokes, 129

Crystallography (X-Ray) : International Tables for (edited by John S. Kasper and Dame Kathleen Lonsdale), Vol. 2, Mathematical Tables, *review* by Dr. A. R. Stokes, 129

Crystals (Organic) : Surface-controlled Bulk Conductivity in (Dr. H. Kallmann and Dr. M. Pope), 753

Crystals (Plastic), and Rotation in the Solid State (Office of Ordnance Research United States Navy Symposium on), 356

Crystals (Sodium Chloride) : Evaporation Figures on the Surface of (Gy. Turchányi and T. Horváth), 601

Cullis, Ann F., and others : Structure of Haemoglobin—a Three-Dimensional Fourier Synthesis at 5·5-Å. Resolution, obtained by X-Ray Analysis, 416

Cullity, B., and Vannotti, Prof. A. : Porphyrin Biosynthesis in the Leucocyte, 187

Cullum Geographical Medal of the American Geographical Society awarded to Dr. Albert P. Crary, 12

Cultivated Mushrooms : 'Watery Stipe' of (Doreen G. Gandy), 482

Cultivation (Mechanical), in India (D. A. Gadkary), *review* by Colin Clark, 414

Cultural Relations with the U.S.S.R., Society for : Lectures by Prof. A. Masevich on the Conquest of Space, 286

Culture of *Desulphovibrio desulphuricans* (Prof. Y. Abd-el-Malek and S. G. Rizk), 635

Culture (Continuous), of Micro-organisms (Microbiology Group of the Society of Chemical Industry Symposium on), 433

Culture (*In vitro*), of *Musa balbisiana* Colla Embryos (Elsie A. Cox, G. Stotzky and Roger D. Goos), 403

Culture Media (Algal), and Sea Water : Volatile Organic Matter in (F. A. J. Armstrong and G. T. Boalch), 761

Cultured Cells of Whole Mouse Embryos : Influenza A' Infection of (J. V. T. Gostling), 328

Cultures (Decontaminating Tissue), Infected with Pleuropneumonia-like Organisms (Dr. Leonard Hayflick), 783

Cultures (*Rhodotorula rosea*) : Effect of Coumarin on the Growth of (J. S. Knypl and J. S. Szopa), 933

Cultures (Serum-free and Serum-containing Cell) : Multiplication of Vaccinia Virus in (Robert W. Pumper, Lawrence J. Alfred and David L. Sackett), 123

Cultures (Serum Agar), of Bone Marrow Flecks : Effect of Amethopterin and 6-Mercaptopurine on the Pattern of Oxygen Tension Measurements in the Fluid Phase of (Dr. H. J. Woodliff and J. M. G. Davis), 477

Cultures (Synchronized), of Algae : A Reversible Inhibition of Photosynthesis in (Dr. Constantine Sorokin), 933

Cumbrae (Isle of) (Firth of Clyde) : *Elminius modestus* Darwin on the (H. T. Powell), 119

Cummings, Dr. R. H. : Awarded a moiety of the Lyell Fund of the Geological Society of London, 657

Cupps, P. T. (edited by H. H. Cole and) : Reproduction in Domestic Animals, Vol. 2, *review* by Sir John Hammond, 492

Currents (Earth), and Micropulsations on November 27, 1959 : Rare Hiss, (E. M. Wescott, J. H. Pope, D. O'Dyer and Dr. W. H. Campbell), 231

Currents (Ion Beam) : Measurement of, using a Hall Effect Magnetometer (W. S. Whitlock and C. Hilsum), 302

Curse or a Crop ? Water Hyacinth—a (N. W. Pirie), 116

Curves (Ultra-Violet Inactivation), of Transforming Deoxyribonucleic Acid : Shape of (Claud S. Rupert and Sol H. Goodgal), 556

Cushing, Dr D. H. . On the Nature of Production in the Sea, 218

Cuticle (Insect) : Homocatechol in an (S. R. A. Malek), 56

Cyanide (Fluorine) : Microwave Spectrum of (Dr. J. Sheridan, J. K. Tyler, Dr E. E. Aynsley, R. E. Dodd and R. Little), 96

Cycle (Enzymatic), of Inorganic Nitrogen in Animal Tissues (Dr. K. Yamafuji, Y. Osajima and H. Omura), 162

Cyclical Activity in Endocrine Systems (Zoological Society of London Symposium on), 663

Cydia pomonella L. (Codling Moth Females) : Physiological Age of, caught in Bait and Light Traps (P. W. Geier), 709

Cyprids (Barnacle) : Mass Rearing of, in the Laboratory (John Moyse), 120

Cysteine : Cysteine-S-sulphonate as an Intermediate in Microbial Synthesis of (Dr. Taro Nakamura and Dr. Ryo Sato), 163

Cysteine-S-sulphonate as an Intermediate in Microbial Synthesis of Cysteine (Dr. Taro Nakamura and Dr. Ryo Sato), 163

Cystine as an Essential Amino-Acid for the Growth of a Strain of *Shigella dysenteriae* I (*Sh. shiga*), (Dr. Ranjit Sen), 267

Cystocaulus ocreatus (Lungworm) : The Field-Slug *Agriolimax reticulatus* as a Vector of the (Dr. J. H. Rose), 180

Cysts (*Heterodera major*) : Effect of Soil Drying on the Viability of (J. J. Duggan), 554

Cytochromess (Crystalline), from *Porphyra tenera* : Preparation of (Eijiro Yakushiji, Yasutomo Sugimura, Ichiro Sekuzu, Ichiro Morikawa and Prof. Kazuo Okunuki), 105

Cytochromes in the Red and the White Muscles of the American Cockroach, *Periplaneta americana* L. : Spectrophotometric Measurement of (Tsutomu Nakatsugawa), 85

Cyto-Genetics at the Royal Botanic Gardens, Kew, 734

Cytoplasmic Membranes : Ionic Exchange and the Structure and Function, including Motility, of (Dr. W. E. Hutton), 439

Cytoplasmic Particles and their Role in Protein Synthesis (Colloid and Biophysics Committee of the Faraday Society Discussion on), 815

Cytotoxic Agents : Effect of, on Antibody Production (Dr. M. C. Berenbaum), 167

Czaja, Prof. M., and Gasparski, J. : Some Red-Cell Antigens of *Bison bonasus* as compared to Red-Cell Antigens of Domestic Cattle, 184

Czecho-Slovak Union of Scientific Workers : International Symposium on Planning in Science, 738

DAHL, Dr. Lewis K., and others : Adrenocortical Function after Prolonged Salt Restriction in Hypertension, 110

Dailey, B. P., and others : Evidence for the Existence of a Potassium Rhenium Hydride and its Bearing on the Nature of the (—1)-Oxidation State of Rhenium, 528

Daily Rotation (Uniform) : Response of Growing Plants to a (R. L. Jones), 775

Dairy Research in Scotland (Dr. C. C. Balch), 147

Dairying, National Institute for Research in : Retirement of Dr. A. T. R. Mattick as deputy chief scientific officer, 11

Dallmeyer : Centenary of the House of, 505

Dalton, Dr. G. C. J. : Appointed director of the Lucas Heights Research Establishment of the Australian Atomic Energy Commission, 889 ; work of, 889

Daly Medal of the American Geographical Society awarded to Dr. Richard Hartshorne, 12

Damage by Streptomycin to the Cell Membrane of *Escherichia coli* (Effect of Streptomycin on *Escherichia coli*), (Nitya Anand and Dr. Bernard D. Davis), 22

Damage (Liver) : A Hepatotoxin causing, in Facial Eczema of Sheep (Dr. N. A Worker), 909

Damage (Radiation) : An Alternative Mechanism for Chemical Protection against (Prof. Mark M. Jones), 96

Damaging Effect of Drying on *Vicia faba* Seeds (Dr. W. Klingmuller and Dr. G. R. Lane), 699

Dana's Manual of Mineralogy (revised by Prof. Cornelius S. Hurlbut, jun.), seventeenth edition, *review*, 721

Danckwerts, Prof. P. V. : Appointed to the Shell chair of chemical engineering in the University of Cambridge, 14

Dandiya, P. C., and others : Separation of the Hypnotic Potentiating Principles from the Essential Oil of *Acorus calamus* L. of Indian Origin by Liquid–Gas Chromatography, 466

Dansgaard, W., and others : Isotopic Distribution in a Greenland Iceberg, 232

Daoust, H. (Senez, M., and) : At the Ninth Canadian High Polymer Forum (Heat Parameters for Polyisobutylene Solutions), 359

Dark Age in Africa, *review* by M. C. Burkitt, 645

Dark Blue Ring developed by Electron Bombardment in Rock Salt (S. Yoshida and T. Ikeda), 755

Darlington, Prof. C. D. : Evolution of Arborvirus Diseases (Relationship between Heredity and Infection in Plant, Insect and Animal Viruses), 740

Darlington, P. J. : The Biology of the Southern Cold Temperate Zone, 206

Darwin : Biological Concepts before, *review* by Sir Gavin de Beer, 2
  Forerunners of, 1745-1859 (edited by Bentley Glass, Oswei Temkin and William L. Straus, Jr.), *review* by Sir Gavin de Beer, 2
Darwin's 'Journal' (edited by Sir Gavin de Beer), 580
Das, Tara Prasad (Saha, Prof. Ajit Kumar, and) : Theory and Applications of Nuclear Induction, *review* by W. M. Lomer, 67
Dating (Radiocarbon), of Soil Humus (Prof. C. O. Tamm and H. G. Östlund), 706
Daubenmire, Prof. R. F. : Plants and Environment, second edition, *review* by W. Tutin, 799
Davey, G. Generation of Temperatures below 1°K. (Use of Liquid Helium-4 as a Constant-Temperature Bath down to about 0.74°K.), 349
Davidson, Basil : Old Africa Rediscovered, *review* by M. C. Burkitt, 645
Davidson, Dr Flora M. : Activation of Plasminogen by Staphylokinase, 626
Davidson, Prof J. Norman, and others . Textbook of Physiology and Biochemistry, fourth edition, *review* by Prof. D. C. Harrison, 719
Davies, Dr D. E · Appointed to a senior lectureship in physics at the University College of North Staffordshire, 737
Davies, Dr. D R., and others : Structure of Myoglobin—a Three-Dimensional Fourier Synthesis at 2-Å Resolution, 422
Davies, Dr. J. T · Appointed to the chair of chemical engineering and to the headship of the Department of Chemical Engineering in the University of Birmingham, 892
Davies, W Morley : Retirement of senior advisory officer in the National Agricultural Advisory Service, 504 ; work of, 504
Davis, Dr. Bernard D. (Anand, Nitya, and) : Effect of Streptomycin on *Escherichia coli*—Damage by Streptomycin to the Cell Membrane of *Escherichia coli*, 22
Davis, Dr. Bernard D., and others : Effect of Streptomycin on *Escherichia coli*—Uptake of Streptomycin by *Escherichia coli*, 23
Davis, G. L (Burdon, P. J , and) : Embrittlement of Tungsten and of Molybdenum, 455
Davis, J. M. G (Woodliff, Dr. H. J., and) : Effect of Amethopterin and 6-Mercaptopurine on the Pattern of Oxygen Tension Measurements in the Fluid Phase of Serum Agar Cultures of Bone Marrow Flecks, 477
Davison, Dr. P F. : Sedimentation of Deoxyribonucleic Acid isolated under Low Hydrodynamic Shear, 918
Dawes, Dr. Ben : Penetration of *Fasciola gigantica* Cobbold, 1856, into Snail Hosts, 51
  Elucidation of the Life-cycle of *Fasciola hepatica*, 331
'Dawn Chorus' : Effect of Latitude on the Diurnal Maximum of (Joseph H. Pope), 87
Dawson, Dr J. K., and Long, Dr. G. : Chemistry of Nuclear Power, *review* by Prof. W. Murgatroyd, 4
Day, Dr. J. P. de C. : Appointed to a senior lectureship in philosophy at the University College of North Staffordshire, 737
Day, J. W. B., and others : Observed Characteristics of an Ultra-High-Frequency Signal Traversing an Auroral Disturbance, 510
Day-release Students in Technical Education, 737
Day-time Maximum of Oblique Auroral Reflexions observed in the Auroral Zone (Alv Egeland, Dr. Bengt Hultqvist and Johannes Ortner), 519
DDT-Resistance in House-Flies : Sex-limited (R. W. Kerr), 868
de Almeida Franco, L. T., and others · A Survey of Abnormal Haemoglobins in Portuguese Guinea, 326
de Beer, Sir Gavin : Biological Concepts before Darwin, *review*, 2
  Retirement from the directorship of the British Museum (Natural History), 582, 888 ; work of, 888
de Beer, Sir Gavin (edited by) · Darwin's 'Journal'. 580
de Belatini, P. C M. : Inadequacy of Scatter Mechanisms in Tropospheric Radio Propagation, 76
DeBoer, Dr. F E. · Purification of Metals by Gas Chromatography, 915
de Long, Dr. George C. (Koeppe, Dr. Clarence E., and) : Weather and Climate, *review* by G. A. Bull, 720
De Paepe, Dr. J. C. : An Autoradiographic Study of the Distribution in Mice of Œstrogens labelled with Carbon-14 and Tritium, 264
de Pritz, María J. R. (Palleroni, Prof. Norberto J , and) : Influence of Sorbic Acid on Acetate Oxidation by *Saccharomyces cerevisiae* var. *ellipsoideus*, 688
de Rodríguez, M. L. G. (Arends, Dr. Tulio, and) : Haptoglobin in Monkeys, 325
de la Tour, E. Boy, and others : Fluorescence Studies of Chloroplast Development in *Euglena*, 825
Deacon, Dr. G. E. R. : The Biology of the Southern Cold Temperate Zone, 205
Deaminase Activity (Adenylic Acid), in Choroid Plexus and Ciliary Process Tissue : Comparative (Prof. Morton R. Waitzman), 388
Dearing, G. G., and Walker, Dr. D. A. : Enzymic Synthesis of L-Aspartate-4-^{14}C., 690
Debenham, Prof. Frank : The World is Round—the Story of Man and Maps, *review* by M. Caradine, 67
Debris (Radioactive), in the Stratosphere : Time of Residence of (J. Ambrosen), 301
2,4-Decadienols isolated from Oils containing Linoleic Acid : The Stereo-Configuration of (G. Hoffmann and J. G. Keppler), 310
Decalcified Human Dentin Collagen : Peptides obtained from Partial Hydrolysis of (Dr. C. C. Solomons), 101
Decapitated Mosquitoes : Respiration of (Rachael Galun), 391
Deciduous Hominid Tooth (Supposed Giant), from Olduvai : An Alternative Interpretation of the (Dr. J. T. Robinson), 407 ; (Dr. L. S. B. Leakey), 408
Decolorizing System (An Anthocyanin-), in Sour Cherries (Prof J. P. Van Buren, D. M. Scheiner and Prof. A C. Wagenknecht), 165
Decomposition of the Beta-Phase in a Copper–Indium Eutectoid Alloy (D. A. Moore, M. White and Dr. D. R. F. West), 454
Decomposition of Lead Azide : Products of (M. Stammler, J. E. Abel and J. V. R. Kaufman), 456
Decomposition of Uranium Dioxide at its Melting Point (Dr. J S. Anderson, J. O. Sawyer, Prof. H. W. Worner, G. M. Willis and M. J. Bannister), 915
Decontaminating Tissue Cultures infected with Pleuropneumonia-like Organisms (Dr. Leonard Hayflick), 783
Decrease in Coenzyme I Content of Spleen after Freezing (Mollie Luscombe), 691
Decrease of the Copper Bands of *Helix pomatia* Haemocyanin (K. Heirwegh and R. Lontie), 853
Dede, N., and others : Effect of Testosterone Propionate and Insulin on Muscle Cholinesterase Activity, 320
Dee, Jennifer : A Mating-type System in an Acellular Slime-mould, 780
Deelder, Dr. C. L. : The Atlantic Eel Problem, 589
Deer (Red), and Vegetation in New Zealand (New Zealand Department of Scientific and Industrial Research, Bulletin 135), 742
Deficiency (Magnesium) : Dietary Phytate as a Possible Cause of (Dr. A. Heulwen Roberts and Prof. John Yudkin), 823
Deficiency Trait (Glucose-6-Phosphate Dehydrogenase), in Nigeria (Dr. H. M Gilles, J. Watson-Williams and B. G. Taylor), 257
Deficient (Erythrocyte Glucose-6-Phosphate Dehydrogenase-) Subjects—Enzyme-Level in Saliva (Dr. Bracha Ramot, Chaim Sheba, Avinoam Adam and Israel Ashkenasi), 931
Dehadrai, Padmakar V. Respiratory Function of the Swim-bladder of *Notopterus* (Lacepede), 929
Dehydration . Effects of, on the Mitochondria of the Mouse Kidney (Mikko Niemi, N. Schor and Dr. A G E Pearse), 786
Dehydrogenase : A Microsomal Malic (Dr. Kenneth H Shull), 582
Dehydrogenase Activity (Succinic), in Osteoclasts Histochemical Demonstration of (Dr M. S Burstone), 866
Dehydrogenase Deficiency Trait (Glucose-6-Phosphate), in Nigeria (Dr. H. M. Gilles, J. Watson-Williams and B G. Taylor), 257
Dehydrogenase-deficient Subjects · Erythrocyte Glucose-6-Phosphate—Enzyme-Level in Saliva (Dr. Bracha Ramot, Chaim Sheba, Avinoam Adam and Israel Ashkenasi), 931
Delacour, Jean : The Waterfowl of the World, Vol 3, Eiders, Pochards, Perching Ducks, Scoters, Golden-eyes and Mergansers, Stiff-tailed Ducks, *review* by Sir Landsborough Thomson, 567
Delavignette, P (Amelinckx, S , and) Observation of Dislocations in Non-metallic Layer Structures, 603
Delayed Birth of Marsupial Macropods—the Euro, the Tammar and the Marloo (R M. Sadleir and J W. Shield), 335
Delayed Fluorescence in Phenanthrene Vapour : Spectrum of—a Criterion of Purity (Dr B. Stevens, E. Hutton and Prof. G Porter), 917
Demetsopoullos, I. C , and others : Self-quenching Geiger Counters containing Mixtures of Permanent Gases, 369
Demonstration of Serum Precipitin to Brain Ganglioside (Dr. Samuel Bogoch), 392
Demonstration (Histochemical), of a Species-Specific Trypsin-like Enzyme in Mast Cells (G. G Glenner and L. A. Cohen), 846
Demonstration (Histochemical), of Succinic Dehydrogenase Activity in Osteoclasts (Dr. M. S Burstone), 866
Dempsey, M. : Dermal Surface of Sheep-Skin, 860
Demyelination in Lambs born of Ewes maintained on High Intakes of Sulphate and Molybdate (C. F. Mills and B. F. Fell), 20
Denamur, R , and Martinet, J. : Physiological Mechanisms concerned in the Maintenance of Lactation in the Goat and Sheep, 252
Denbigh, Prof K. G. : Appointed to the University of London chair of chemical engineering science in the Imperial College of Science and Technology, 14
Denervated Muscle Lack of Correlation between Synthesis of Nucleic Acids and Proteins in (R. Zák and Dr. E. Gutmann), 766
Dénes, Dr. G , and Polgár, Dr L. : Effect of Nitroacridine 3663 on Synthesis of Deoxyribonucleic Acid and Multiplication of T_2 Phage, 386
Dennis, J. A., and others : Self-quenching Geiger Counters containing Mixtures of Permanent Gases, 369
Density of Interplanetary Gas : Erosion of Meteorites in Space and the (Dr. L. Reiffel), 821
Density (Electron), in the Ionosphere · Variation of, with Magnetic Dip (Sheila Croom, Audrey Robbins and J. O. Thomas), 902
Density (Upper-Atmosphere) : Variation of, with Latitude and Season—Further Evidence from Satellite Orbits (D. G. King-Hele and D. M. C. Walker), 727
Dental Caries . Urinary Selenium and (P B. Cadell and F. B. Cousins), 863
Dentice di Accadia, F., and others : Incorporation of α,ω-Dicarboxylic Acids as Side-Chains into the Penicillin Molecule, 97
Dentin Collagen (Decalcified Human) : Peptides obtained from Partial Hydrolysis of (Dr. C. C. Solomons), 101
Deoxyribonucleic Acid · Effect of Ultra-violet Light on the Shape and Size of (Dr. P. Alexander and Dr. H. Moroson), 678
  Incorporation of Tritium-labelled Thymidine and Tritium-labelled Deoxycytidylic Acid into, after Irradiation of the Deoxyribonucleic Acid Primer with γ-Rays (Dr. S. Okada), 193
  Shape of Ultra-Violet Inactivation Curves of Transforming (Claud S. Rupert and Sol H. Goodgal), 556
Deoxyribonucleic Acid isolated under Low Hydrodynamic Shear : Sedimentation of (Dr. P. F. Davison), 918
Deoxycytidylic Acid (Tritium-labelled), into Deoxyribonucleic Acid : Incorporation of Tritium-labelled Thymidine and, after Irradiation of the Deoxyribonucleic Acid Primer with γ-Rays (Dr. S. Okada), 193
Deoxyribonucleic Acid of Rat Thymus Cells : Labelling of Deoxyribose with Carbon-14 in relation to Incorporation of Phosphorus-32 into the Nucleotides of (Dr. S. Itzhaki), 614
Deoxyribonucleic Acid Primer : Incorporation of Tritium-labelled Thymidine and Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid after Irradiation of the, with γ-Rays (Dr. S. Okada), 193
Deoxyribonucleic Acid Synthesis : Correlation of Loss of Photoreversibility of Ultra-violet-induced Mutations with (Dr. F. L. Haas and Dr. C. O. Doudney), 637
Deoxyribonucleic Acid and Multiplication of T_2 Phage : Effect of Nitroacridine 3663 on Synthesis of (Dr. G. Dénes and Dr. L. Polgar), 386
Deoxyribose : Labelling of, with Carbon-14 in relation to Incorporation of Phosphorus-32 into the Nucleotides of Deoxyribonucleic Acid of Rat Thymus Cells (Dr. S. Itzhaki), 614
Dependence of Periodic Activation and Inhibition of Monoaminoxidase by Aliphatic Compounds upon Chain-length (Dr. George C. Cotzias and Dr. James J. Greenough), 384
Dependence on Temperature of Elastic Moduli of Tin (P. Jayarama Reddy and S. V. Subrahmanyam), 29
Deposition (Manganese), on the Shells of Living Molluscs (Dr. J. A. Allen), 336
Derblom, H. (Stoffregen, W., and) : Life-Time of the Atomic Oxygen 6300 A. Line in the Auroral Spectrum, 28
Derbyshire, H., and others : Photolysis of 1.3-Dichlorotetrafluoroacetone, 683

Derbyshire : Bedrock Corrosion and Drainage Initiation by Seepage Moisture on a Gritstone Escarpment in (B. T. Bunting), 447
Derivatives (Methanesulphonic Acid), of Central Stimulant Drugs (Dr. W. Logemann, F. Lauria and D. Artini), 532
Derivatives (Synthetic Polypeptide), with Anti-Bacterial Activities (Dr. K. Kovács, Dr A Kótai and Dr. I. Szabó), 266
Dermal Surface of Sheep-Skin (M. Dempsey), 860
Descent (The Approaching), of *Sputnik* 3 (1958δ_2), (B. R. May), 729
Descriptive Astronomy, *review* by Dr. R H. Garstang, 130
Desert Locust : Fertilization of Eggs of the, by Spermatozoa from Successive Copulations (Philip Hunter-Jones), 336
  Time of Feeding in relation to the Toxicity of a Stomach Poison to the (R. D MacCuaig and W. S. Watts), 335
Desikachary, T. V . Algology (Advances in the Study of the Submicroscopic Morphology of Algae), 820
Desulphovibrio desulphuricans : Culture of (Prof. Y. Abd-el-Malek and S. G. Rizk), 635
Detection (Nocturnal), of Tsetse Flies in Nigeria with Ultra-Violet Light (W. McDonald), 867
Determination of Oxygen in Iron and Steel (M. L. Pearce and C R. Masson), 373
Determination of Strontium-90 Distribution in Human Bone (R. Bjornerstedt and S Häggroth), 366
Determination of Tetrahedral Aluminium in Mica by Infra-Red Absorption Analysis (Dr R. J. P Lyon and Dr W. M. Tuddenham), 374
Determination (Colorimetric), of Amino-acid Concentration (Dr. W. A. Vincent), 530
Determination (Infra-Red), of the Kaolin Group of Minerals (Dr. R. J. P. Lyon and Dr. W. M Tuddenham), 835
Determination (Spectrophotometric), of Tryptophan by the Method of Roth and Schuster—some Sources of Error (Ivan Larsen), 316
Detonation Front : Emission and Absorption of Light behind the (Prof. C. H. Johansson and T. Sjolin), 523
Detweiler, Dr David K. · Awarded a grant of 1,100,000 dollars from the National Heart Institute of the United States National Institutes of Health, for research and training in comparative cardiovascular studies, 433
Deuterium–Hydrogen Exchange between Water and Macromolecules—Accessibility of Cellulose (Dr John L. Morrison), 160
Deutsch, Dr. E R. : Optical Scanning of Liquid Concentration in Flow Studies with Porous Models, 675
Deutsch, Dr. J A. : The Plexiform Zone and Shape Recognition in the Octopus, 443
Developer in Carbohydrate Chromatography : Benedict's Solution as a (Roderick P. Murphy), 455
Development : Commonwealth Education and, 489
  Research and, 588
Development of Atomic Energy in Britain, 127
Development in Pea (Abnormal Growth and), resulting from Exposure to Adverse Conditions during Germination (Alex. M. M. Berrie), 626
Development of Roots and Root Hairs of Subterranean Clover (*T. subterraneum*) : Effect of Micro-organisms on the (A. D. Rovira and G. D. Bowen), 260
Development of Wood-using Industries (Sir Harry Champion), 894
Development (Abbreviated), in a Pinnotherid Crab (Dr. I. Goodbody), 704
Development (Chloroplast), in *Euglena* : Fluorescence Studies of (Dr. H. T. Epstein, E. Boy de la Tour and Dr. Jerome A Schiff), 825
Development (Industrial), 1800 to the Present Day : The Rhondda Valleys—a Study in (E. D Lewis), *review* by Prof L. Dudley Stamp, 415
Development (Skeletal), and Ageing : Periosteal Osteoclasts, (Dr. E. A. Tonna), 405
Development (Research and), in the United States : Funds for (United States National Science Foundation), 813
Developments in Gamma-Ray Optics (Prof. P. B. Moon), 427
Devices : Dielectric (University of Birmingham Residential Conference on), 360
Devlin, T. M , and others : Anaerobic Glycolysis of Dispersed Cell Suspensions from Normal and Malignant Tissues, 315
Dewsnap, J. W (Kakabadse, Dr. G., and) : The Sodium Silicate–Hydrogen Peroxide System, 761
Di Luzio, Dr. N R. . Modification of Cholesterosis and Lipidosis of Rats maintained on an Atherogenic Diet, 616
Diabetic and Normal Baboons : Influence of Insulin on the Incorporation of 2-^{14}C-Sodium Pyruvate into Glyceride Glycerol in (N. Savage, Prof J. Gillman and C. Gilbert), 168
3:3'-Diamidinocarbanilide, a New Drug Active against Babesial Infections (Dr. J. N. Ashley, S. S. Berg and J. M. S Lucas), 461
α,ε-Diaminopimelic Acid—its Distribution, Synthesis and Metabolism (Dr. L. E Rhuland), 224
Diamond : Alleged Formation of an Intermediate Diamond Structure on Heating (Dr. F. A. Raal), 523
  Graphitization of (Dr M Seal), 522
Diamond Structure : Alleged Formation of an Intermediate, on Heating Diamond (Dr. F. A. Raal), 523
Diamonds (Synthetic) : Interferometric Studies on (Prof. S. Tolansky and Dr. I Sunagawa), 203
Diaphragm (Isolated Rat) : Effects of Starvation on the Ability of, to Incorporate Labelled Amino-Acids into its Protein and to Respond to the Influence of Insulin on this Process (Dr. K. L. Manchester), 907
Diaphragm (Rat) : Salicylate and Potassium Fluxes of (Dr. J. A. Hicklin), *errata*, 275
Diathelic Immunization of Sheep against a Rat Cancer (Prof. B. Sekla and E. Holečková), 618
Dicarboxylic Acid Cycle : Microbial Oxidation of Glycollate via a (Dr. H. L. Kornberg and J. R. Sadler), 153
α,ω-Dicarboxylic Acids: Incorporation of, as Side-Chains into the Penicillin Molecule (A. Ballio, Prof. E. B. Chain, F. Dentice di Accadia, Maria Francesca Mastropietro-Cancellieri, G. Morpurgo, G. Serlupi-Crescenzi and G. Sermonti), 97
1:3-Dichlorotetrafluoroacetone : Photolysis of (R. Bowles, H. Derbyshire, Dr. J. R. Majer and Dr. C. R. Patrick), 683
Dick, W. E. : *Obituaries* by Derek Wragge Morley and L. J. F. Brimble, 576
Dickens, P. G., and others : Second Explosion Limit of Dried Carbon Monoxide–Oxygen Mixtures, 606
Dickerson, Dr. R. E., and others : Structure of Myoglobin—a Three-Dimensional Fourier Synthesis at 2-Å. Resolution, 422
Dickinson, C. J. : Rapid Contractile Properties of Isolated Mammalian Arteries, 620
Dickinson, Prof. R. E. · Conurbations of Great Britain, *review*, 877
Dicksee, C. Bernard, and Mucklow, Prof. G. Fernie : Awarded the James Clayton Prize for 1959 of the Institution of Mechanical Engineers, 814
Diego Blood-Group Antigen : Absence of, in the Lapps (Dr. Leif Kornstad), 325
Dielectric Devices (University of Birmingham Residential Conference on), 360
Diemer, G. : Dielectric Devices (Present and Potential Applications of Luminescence and Photoconductivity in Power Amplification), 360
Dienes, Z. P · Mathematics and Children, 581
Dienstbier, Zdenek, and Andrysek, Oskar : Early Injury of Chromo-excretion after Total Irradiation of Rats, 630
Diet (Atherogenic) : Modification of Cholesterosis and Lipidosis of Rats maintained on an (Dr. N. R. Di Luzio), 616
Diet (Human), in the United Kingdom : Relationship between the Rate of Fall-out and the Concentration of Strontium-90 in (Dr. J D. Burton, G M. Milbourn and Dr. R. Scott Russell), 498
Dietary Fats and Thrombosis (Dr. Torben Geill, Dr. Per From Hansen and Dr. Erling Lund), 330
Dietary Liver Necrosis : Intracellular Potassium in (A. E. M. McLean), 936
  'Phenergan' and Versene in (A. E. M. McLean), 191
Dietary Phytate as a Possible Cause of Magnesium Deficiency (Dr. A. Heulwen Roberts and Prof. John Yudkin), 823
Dietary Substances : Effectiveness of, in reducing the Retention of Chronically Ingested Radiostrontium—Studies with Tannin (Prof. R. H. Wassermann and Dr. C. L. Comar), 629
Diethylstilboestrol : Minimum Dose of, required to Stimulate the Phagocytic Activity of the Reticulo-Endothelial System (Prof T. Nicol and C. C. Ware), 42
Differences (Age), in Movement Pattern (K. F. H. Murrell and D. G. Entwistle), 948
Different Collagens and Gelatins . Ester-like Groups in (Dr. Jake Bello), 241
Different Types of Milk : Effect of, on Intestinal Motility (Prof. A. H. Mohamed, O. Zaki, K. Zaki and L Fahim), 773
Different Types of Muscle . Effect of Heavy Water on, and on Glycerol-extracted Psoas Fibres (Dr. Benjamin Kaminer), 172
Differential Transmission of Gametes in Wheat (N. H. Luig), 636
Differentiation induced as Season Advances in the Embryo-Gametophyte Complex of *Pinus nigra* var. *austriaca*, using Indole Acetic Acid (Prof. Norman W. Radforth and Dr. J. M. Bonga), 332
Differentiation (Cellular) . Occurrence of an Organ-Specific Antigen associated with the Microsome Fraction of Plant Cells and its Possible Significance in the Process of (Dr. S. T. C. Wright), 82
Differentiation (Flower), in Petkus Winter Rye : Effect of Gibberellic Acid on (O. H Caso, H. R. Highkin and D. Koller), 477
Diffraction Photographs (X-Ray), of α-Keratin : Meridional Reflexions in the (W. J Onions, H. J. Woods and P B. Woods), 157
Diffraction Study (Neutron), of Anti-ferromagnetic Spin Waves in α-Ferric Oxide (J. A. Goedkoop and T. Riste), 450
Diffusion of Water through Isolated Human Epidermis : Effect of Soap on the (F. Ray Bettley and Elaine Donoghue), 17
Diffusion (Concentration-dependent) : A Very General Class of Exact Solutions in (J. R. Philip), 233
Diffusion (Free), of Proteins . The Nuclear Membrane as a Barrier to the (Carl M. Feldherr and Ailene B. Feldherr), 250
Digital Computers, National Centre of Information on Automatic Programming of (Brighton Technical College), 214
Dihydroergotamine : Fall in Haematocrit in Sheep after Treatment with Chlorpromazine and (Dr. A. W. Turner and V. Elizabeth Hodgetts), 43
3:5-Diiodotyrosine and Thyroxine : Synthesis of Tritium-labelled Tyrosine, (Dr. J. R. Tata and A. D. Brownstone), 34
Dijksterhuis, Prof. E. J. : Mechanics in the Middle Ages, *review*, 491
Dill, W A., and others : A New Metabolite of Chloramphenicol, 535
Dilute Aqueous Solution : Effect of Ionizing Radiation upon Xanthosine in (Dr. G. Hems), 525
Dingle, Dr. R. B. : Appointed to the new chair of theoretical physics in St. Salvator's College (University of St. Andrews), 430 ; work of, 430
Dingwall, Dr. E. J. : The Case for Extra-Sensory Perception, *review*, 646
Dinitriphenol . Need for Inorganic Phosphate in Oxidations stimulated by (P. Borst and Prof. E. C. Slater), 537
Dinoflagellate *Amphidinium carteri* . Low Molecular Weight Organic Base from the (Peter J. Wangersky and Robert R. L. Guillard), 689
Dinter, Dr. Z. (Bakos, K., and) : Identification of a Bovine Mucosal-Disease Virus isolated in Sweden as *Myxovirus para-influenzae* 3, 549
Diode 'EW97/1' : Parametric Amplifier (General Electric Co., Ltd.), 355
Diodes : Tunnel, 814
Diodes (Tunnel) : Gallium Arsenide (K. G. Hambleton, J. J. Low and R. J. Sherwell), 676
Diomedea exulans Linnaeus : Chick Feeding in the Wandering Albatross (W. L. N. Tickell), 116
Dioxide (Carbon) Assimilation by *Leishmania donovani* (Dr. A. N. Chatterjee and Dr. J. J. Ghosh), 322
Dioxide (Carbon) Output of *Periplaneta americana* : A Temperature-dependent Endogenous Rhythm in the Rate of (Dr. M. B. Wilkins), 481
Dioxide (Uranium) : Decomposition of, at its Melting Point (Dr. J. S. Anderson, J O. Sawyer, Prof. H. W. Worner, G. M. Willis and M. J. Bannister), 915
Diploma Course (Postgraduate), in Conservation at University College, London, 814
Direction of Growth : Effect of, on Sultana Canes (P. May), 394
Direction of Scientific and Technical Research in France, 896
Directional Sensitivity : A Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* in Terms of (Prof. O. Lowenstein and J. Wersall), *errata*, 76
Disarmament (Nuclear), Campaign for : Formation of a Scientists Group, 815
Discrimination (Pitch) in Orthoptera (Insecta) demonstrated by Responses of Central Auditory Neurones (Dr. G. A. Horridge), 623

Disease : Immunity of Mice surviving Systemic Leukaemia (*L*1210) to Antifolic Resistant Variants of the (Dr. Abraham Goldin, Stewart R. Humphreys, Gerald O. Chapman, Dr. Michael A Chirigos and John M. Venditti), 219
Disease of Sheep : Scrapie, a Transmissible Hereditary (H. B. Parry), 441
Disease (Haemolytic), of the Newborn probably due to Anti-*f* (Dr. Philip Levine, Jane White, Marjory Stroup, C. M. Zmijewski and James F. Mohn), 188
Disease (Potato Wart), *Synchytrium endobioticum* (Schilb.) Perc. (Vit Bojnansky), 367
Disease (Renal) : Plasma Erythropoietin in Polycythaemia Secondary to (R. W. Payne, N. F. Jones and R. D. Hyde), 549
Diseases of the Blood Grants, Scholarships and Fellowships for Research on (Lady Tata Memorial Trust), 433
Diseases (Arborvirus) : Evolution of (Royal Society of Tropical Medicine and Hygiene Symposium on), 740
Diseases (Communicable), in School (United Nations, World Health Organization Report on), 736
Diseases (Fungal), of Animals (Dr. G. C. Ainsworth and P. K. C. Austwick), *review* by J. E. Smith, 720
Disease (Runt), and Tolerance in Rabbits (K. A Porter), 789
Dislocations in Non-metallic Layer Structures : Observation of (S. Amelinckx and P. Delavignette), 603
Disperse Systems : Rheology of—Proceedings of a Conference organized by the British Society of Rheology, Swansea, 1957 (edited by C. C. Mill), *review* by Dr. G W. Scott Blair, 878
Dispersed Cell Suspensions from Normal and Malignant Tissues : Anaerobic Glycolysis of (Dr. M Zimmerman, T. M. Devlin and M P. Pruss), 315
Dispersion of Ultrasonic Waves · Absorption and (Karl F. Herzfeld and Theodore A. Litovitz), *review* by Prof E. G. Richardson, 3
Dispersion Studies (Optical Rotatory), on Partially Methylated Cellulose (W. Brock Neely), 159
Disposal of Radioactive Waste, 1
Dissimilarities (Some Similarities and), in the Structure of the Skin among the Members of the Suborders Odontoceti and Mystacoceti (Cetacea), (Dr W Sokolov), 745
Dissolution of Chrysotile Asbestos in Water, Acid and Alkali (S. G. Clark and Dr. P. F. Holt), 237
Dissolution of Silicate Rocks (R R Brooks), 837
Distillation (European Federation of Chemical Engineering Symposium on), 660
Distortion (Tertiary Crustal), in Mid-Argyll : Evidence for (Dr. J. L. Knill), 234
Distortions in Metallic Structures (Dr. J. Graham), 29
Distribution of Gm^a and Gm-like among Javanese, Djuka Negroes, and Oyana and Carib Indians (Prof. Arthur G. Steinberg, Rachel Stauffer and Hugh Fudenberg), 324
Distribution in Mice of Œstrogens labelled with Carbon-14 and Tritium : An Autoradiographic Study of the (Dr. J. C. De Paepe), 264
Distribution of Tryptophan in the Brain (Shirley A. P. Price and Dr. G. B. West), 470
Distribution (Isotopic), in a Greenland Iceberg (W. Dansgaard, G. Nief and E. Roth), 232
Distribution (Strontium-90), in Human Bone · Determination of (R. Bjornstedt and S. Haggroth), 366
Distribution, Synthesis and Metabolism : a,ϵ-Diaminopimelic Acid—Its (Dr. L. E. Rhuland), 224
Disturbance (Auroral) : Observed Characteristics of an Ultra-High-Frequency Signal Traversing an (J. C. James, L. E. Bird, R. P. Ingalls, M. L. Stone, J. W. B. Day, G. E. K. Lockwood and R. I. Presnell), 510
Disturbed Laboratory Rats Failure of Growth in (Dr Hannah Steinberg and R. H J. Watson), 615
Disulphides (Irradiated Thiols and) : Electron Paramagnetic Resonance Observations on (T. Henriksen and A. Pihl), 307
Diurnal Effects (Solar and), in the High Atmosphere by Artificial Satellites : Measurement of (H. A. Martin and Dr. W. Priester), 600
Diurnal Maximum of 'Dawn Chorus' : Effect of Latitude on the (Joseph H Pope), 87
Djuka Negroes, and Oyana and Carib Indians : Distribution of Gm^a and Gm-like among Javanese, (Prof. Arthur G. Steinberg, Rachel Stauffer and Hugh Fudenberg), 324
Dodd, Dr. J. M., and others A Neurohypophyseal Principle in the Elasmobranch Pituitary, 850
Dodd, Dr. M. H. I., and others . A Neurohypophyseal Principle in the Elasmobranch Pituitary, 850
Dodd, R. E., and others : Microwave Spectrum of Fluorine Cyanide, 96
Dog : Urinary Œstrogens of the (Dr. John Kristoffersen and Waiert Velle), 253
Dogfish (Common) : Abnormalities in the Urino-genital System of the (Dr. A. S Fuller and J. M. Zacharov), 50
Dollar, Dr. A. T. J. : Geological Implications of Recent Geophysical Work in the British Isles, 739
Domestic Animals : Reproduction in (edited by H. H. Cole and P. T. Cupps), Vol. 2, *review* by Sir John Hammond, 492
Domestic Cattle : Some Red-Cell Antigens of *Bison bonasus* as compared to Red-Cell Antigens of (Prof. M Czaja and J. Gasparski), 184
Domestic Fowl (Intact) : Experimentally Induced Proliferation of the Rudimentary Gonad of an (Prof. W. Kornfeld), 320
Domestic Oil-Heating, 355
Dominance (Eye), and Eye Closure : Relation of (S. T. Chan and Prof. K. S. F. Chang), 539
Donald, Prof. K W. : Elected a Fellow of the Royal Society of Edinburgh, 734
Donoghue, Elaine (Bettley, F. Ray, and) : Effect of Soap on the Diffusion of Water through Isolated Human Epidermis, 17
Donovan, Dr. D. J. : Geological Implications of Recent Geophysical Work in the British Isles, 740
Dons or Crooners? (Sir Eric Ashby), (British Association Granada Lectures on Communication in the Modern World), *review* by B. Silcock, 130
Doors : Out of (edited by Winwood Reade), *review* by B. J. G. Maitland, 567
Dorfman, Dr. Albert (Schiller, Dr. Sara, and) : Effect of Age on the Heparin Content of Rat Skin, 111
Dorman, R. G. : Aerodynamic Capture of Particles (Particulate Filters), 665
Dormancy of *Fraxinus excelsior* L . Interaction of Growth Inhibitor and a Natural Germination Stimulator in the (T. A. Villiers and Prof. P. F. Wareing), 112
Dormant Bacterial Spores Permeability of (Dr. Samuel H. Black, Dr. R. E. MacDonald, Dr. Tadayo Hashimoto and Prof. Philipp Gerhardt), 782
Dorsal Fontanelles in Selachian Neurocrania (Dr. A. R. Hamdy), 939
Dose (Cellular Lethal), and the Critical Cell Number for the *C3H* Mouse Mammary Carcinoma · Estimation of the, from Radiosensitivity Studies *in vivo* (A. Cohen and L. Cohen), 262
Dose (Low-) Neutron Exposure : Conditioned Avoidance Behaviour induced by (Dr. John Garcia and Dr. Donald J. Kimeldorf), 261
Dose (Minimum), of Diethylstilboestrol required to Stimulate the Phagocytic Activity of the Reticulo-Endothelial System (Prof T. Nicol and C. C. Ware), 42
Doses (Small), of Alcohol : Effect of, on a Skill resembling Driving (Prof. G. C. Drew, W. P. Colquhoun and Hazel A. Long), 354
Doty, Prof. Paul, and others · Optical Rotation and Configuration of Poly-L-Tyrosine, 534
Double-Beam Spectrophotometers (Infra-Red) : Emission Spectroscopy with (J Braunbeck), 754
Doudney, Dr. C. O. (Haas, Dr F. L., and) : Correlation of Loss of Photoreversibility of Ultra-violet-induced Mutations with Deoxyribonucleic Acid Synthesis, 637
Dounreay Reactor : Graphite Blocks for the (Morgan Crucible Co , Ltd), 76
Dove, J. E., and others : Second Explosion Limit of Dried Carbon Monoxide—Oxygen Mixtures, 606
Downing, Dr. E. (Taylor, Dr. F. J , and) Fourah Bay College, University College of Sierra Leone, 884
Doy, Dr. C. H., and Pittard, A. J. : Feedback Control of Tryptophan Biosynthesis, 941
Drabble, Dr. J. R. : Electron–Phonon Interactions in Solids (Experimental Investigations of Thermo-electric Effects in Metals and Semiconductors), 586
Drainage Initiation by Seepage Moisture on a Gritstone Escarpment in Derbyshire : Bedrock Corrosion and (B. T. Bunting), 447
Drew, Prof. G. C., and others : Effect of Small Doses of Alcohol on a Skill resembling Driving, 354
Dried Blood Smears : Absorption–Elution Grouping of (S. S. Kind), 397
Dried Carbon Monoxide—Oxygen Mixtures: Second Explosion Limit of (P. G. Dickens, J. E. Dove, J F. Harrold and Dr. J. W Linnett), 606
Drift : Continental (Prof J. A. Jacobs), 231
Drifts (Horizontal), in the *E*-Region at Waltair (R. Raghava Rao and Prof B. Ramachandra Rao), 27
Driving . Effect of Small Doses of Alcohol on a Skill resembling (Prof G. C. Drew, W. P. Colquhoun and Hazel A Long), 354
Dropping Mercury Electrode . Influence of Nitrogen-containing Bases on the Rate of the Electrode Processes at the (V. Volková), 743
Drosophila : Automatic Time/Response Records with (G. A. Wheatley and J A. Hardman), 708
Drug (A New), Active against Babesial Infections : 3:3'-Diamidinocarbanilide, a (Dr. J. N. Ashley, S. S. Berg and J. M. S. Lucas), 461
Drug Evaluations in Man . Interactions between Pharmacodynamic and Placebo Effects in (Dr. Walter Modell and Dr. Margaret Garrett), 538
Drugs (Central Stimulant) : Methanesulphonic Acid Derivatives of (Dr. W. Logemann, F. Lauria and D Artini), 532
Drying : Damaging Effect of, on *Vicia faba* Seeds (Dr. W. Klingmuller and Dr G. R. Lane), 699
Drying in Sugar Protein Mixtures : Survival of (B R Record and R. Taylor), 944
Drying (Soil) Effect of, on the Viability of *Heterodera major* Cysts (J. J. Duggan), 554
DuBridge, Dr L. A. : Basic Research, 716
DuPorte, Prof. E. Melville : Manual of Insect Morphology, *review* by H. Oldroyd, 3
DuRietz, G E (Skottsberg, C. J. F , and) : The Biology of the Southern Cold Temperate Zone, 205
Dubowitz, Victor, and Pearse, Dr. A. G Everson : Reciprocal Relationship of Phosphorylase and Oxidative Enzymes on Skeletal Muscle, 701
Duggan, J. J. : Effect of Soil Drying on the Viability of *Heterodera major* Cysts, 554
Duinker, S : Dielectric Devices (Square-loop Ferrite Device for the Fast Scanning of Electroluminescent Crossbar Systems), 361
Duncombe, W. G., and others : Powerful Adrenergic Neurone-blocking Agents related to Choline 2,6-Xylyl Ether Bromide, 925
Dunham, Prof K. C. : The Future of Non-Ferrous Mining in Great Britain and Ireland, *review*, 801
Dunne, Dr. P. B , and Tapley, Dr D. F. · Oxygen Consumption by Tissues from Rats injected with L- or D-Thyroxine, 622
Durrant, Dr. A., and Tyson, H. : Conditioned Lines of Flax, 60
Dwarfism (Genetic), in *Tephrosia vogelii* : Reversal of, by Gibberellin (James E. Irvine and Rubén H Freyre), 115
Dyeing (Protein), with Bromocresol Green : Scanning of Paper Electrophoretograms after (A. Clark), 243
Dyer, D. O , and others : Rare Hiss, Earth Currents and Micropulsations on November 27, 1959, 231
Dyes (Xanthene) . Chromatography of (Dr. Kenneth B. Taylor), 243

E-REGION at Waltair : Horizontal Drifts in the (R. Raghava Rao and Prof. B. Ramachandra Rao), 27
Eames, F. E., and others : Mid-Tertiary Stratigraphical Palaeontology, 447
Ear Tumours in Rabbits receiving Strontium-90 (Dr. H. A. Sissons and Dr. Janet Vaughan), 399
Early Embryonic Mortality in Temporarily Fasted Mice : Use of Chorionic Gonadotropin to prevent (T. J. McClure), 622
Early Injury of Chromoexcretion after Total Irradiation of Rats (Zdenek Dienstbier and Oskar Andrysek), 630
Earth : The Rotation of the (Prof. W. Munk and Dr. G. J. F. MacDonald), awarded the Monograph Prize of 1959 of the American Academy of Arts and Sciences, 660
  Some Consequences of Expansion of the (Prof J. Tuzo Wilson), 880
  Tektites and the (Dr. Gerald S. Hawkins), 300

Earth (An Expanding), with Loss of Gravitational Potential Energy (Prof. A. E. Beck), 677
Earth Currents and Micropulsations on November 27, 1959 · Rare Hiss, (E. M. Wescott, J. H. Pope, D O Dyer and Dr. W. H. Campbell), 231
Earth Satellites (Artificial) : Observations of Ionization induced by (Prof. John D Kraus, Robert C Higgy, Donald J. Scheer and W. Reed Crone), 520
Earth's Core : Temperatures within the (Prof. J. A Jacobs), 521
Earth's Magnetic Field · Micropulsations in the, simultaneous with Pulsating Aurora (Dr. W. H. Campbell), 677
Earth (Rare-) Fatty Liver (Dr. Fred Snyder, Edgar A Cress and Granvil C. Kyker), 480
Eastoe, Dr. J. E. · At the Eighteenth Meeting of the Research Panel of the British Gelatine and Glue Research Association (Bone—the Structure of a Biological Microcosm), 587
Ebisuzaki, Y (Sivertz, C , and) : At the Ninth Canadian High Polymer Forum (The Measurement of the Cross-Termination Velocity Constants for Picrylhydrazyl and Alkyl Radicals), 359
Eclipse (Solar), of October 2 · Observations on the (Dr. Jules Aarons, John P. Castelli,. Ronald M. Straka and William C. Kidd), 230
Ecology in Africa : Agriculture and (Prof. John Phillips), *review* by Dr. Kenneth Mellanby, 564
Ecology of Parasites (Parasitology Group of the Institute of Biology Discussion on), 290
Ecology (Tropical), International Society of : Inauguration of the, 433
  Election of Officers for 1960-61, 433
Economic Survival Market Strategy and, *review* by Prof. R G. D. Allen, 645
Eczema (Facial), of Sheep : A Hepatotoxin causing Liver Damage in (Dr. N. A. Worker), 909
Eddington Medal of the Royal Astronomical Society awarded to Dr. R. d'Estcourt Atkinson, 144
Eddington Memorial Lecture for 1960 (Prof. Michael Polanyi), 146
Eden, Dr. P. M. G. Industrial Archaeology (Technique of Recording Industrial Monuments), 357
Edinburgh Geological Society Grants for 1960-61 from the Clough Memorial Research Fund, 506
Education : Primary—Suggestions for the Consideration of Teachers and Others concerned with the Work of Primary Schools (Ministry of Education), *review*, 877
Education, Ministry of · 15 to 18—a Report of the Central Advisory Council for Education (England), Vol. 1, Report, 341, 873
  Becoming a Teacher, revised edition, 432
  The Youth Service in England and Wales, 873
  Primary Education—Suggestions for the Consideration of Teachers and Others concerned with the Work of Primary Schools, *review*, 877
Education (England), Central Advisory Council for : 15 to 18, a Report of the, Vol. 1, Report (Ministry of Education), 341, 873
Education (Technical) : Day-release Students in, 737
Education (Technological), London and Home Counties Regional Advisory Council for : Bulletin on Courses in Advanced Technology, 506
Education (Technological), and the Nuffield Foundation, 658
Education ('Teen-Age'), in England, 341 ; (Lady Simon of Wythenshawe), 712
Education (University), in Central Africa (Prof. F. G. Young), 816
Education Conference (Commonwealth) : Report of the (Commonwealth Relations Office), 490
Education and Development : Commonwealth, 489
Education and Training in Nutrition in Europe (Food and Agriculture Organization and the World Health Organization of the United Nations Symposium on), 585
Edward's (King) Hospital Fund for London : Hospital Library Services, a Pilot Survey, 589
Edwards, A. P., and others : Removal of Fixed Ammonium from Clay Minerals by Cation Exchange Resins, 792
Eel Problem : The Atlantic (Dr. C. L. Deelder), 589 ; (Dr. Denys W. Tucker), 591
Effect of Adrenaline and Insulin upon the Oxygen Consumption of Hyperthyroid Rats (R L. Himsworth), 694
Effect of Age on the Heparin Content of Rat Skin (Dr. Sara Schiller and Dr Albert Dorfman), 111
Effect of Amethopterin and 6-Mercaptopurine on the Pattern of Oxygen Tension Measurements in the Fluid Phase of Serum Agar Cultures of Bone Marrow Flecks (Dr. H. J. Woodliff and J. M. G. Davis), 477
Effect of Antihistamines on Mitochondrial Swelling and Liver Injury (Dr. J. D. Judah), 390
Effect of Cardiac Glycosides and Inorganic Ions on Binding of Serotonin by Platelets (Herbert Weissbach, Betty G. Redfield and Elwood Titus), 99
Effect of Cations on γ-Aminobutyric Acid Levels in Slices of Brain Cortex (Dr. R. Rybová), 542
Effect of Chlorpromazine on Tissue Metabolism *in vitro* (Dr. J Kozák, Dr. A. Zeleny and N. Lang), 107
Effect of Corona on Travelling Waves (Dr. M. Ouyang), 524
Effect of Coumarin on the Growth of *Rhodotorula rosea* Cultures (J. S. Knypl and J. S. Szopa), 933
Effect of Cytotoxic Agents on Antibody Production (Dr. M C. Berenbaum), 167
Effect of Different Types of Milk on Intestinal Motility(Prof. A. H. Mohamed, O. Zaki, K. Zaki and L. Fahim), 773
Effect of Direction of Growth on Sultana Canes (P. May), 394
Effect of Flow-Rate and Sample-Size on Column Efficiency in Gas-Liquid Chromatography (Prof. Richard A. Bernhard), 311
Effect of Foetal Hypophysectomy on the Foetal Liver Fat in the Rabbit (Dr. J. G Bearn), 849
Effect of Gibberellic Acid on Flower Differentiation in Petkus Winter Rye (O H. Caso, H. R. Highkin and D. Koller), 477
Effect of Gibberellic Acid on Hypocotyl Growth of Lettuce Seedlings (Dr. B. Frankland and Prof. P. F. Wareing), 255
Effect of Gibberellic Acid on Seeded Grapes (S. Lavee), 395
Effect of Gibberellin on the Flower Initiation and Stem Extension in Petkus Winter Rye (Dr. O. N. Purvis), 479
Effect of Glycosylation on the Enzymic Oxidation and Translocation of Flavonoids (Dr. E. A. H. Roberts), 536
Effect of Heavy Water on Different Types of Muscle and on Glycerol-extracted Psoas Fibres (Dr. Benjamin Kaminer), 172
Effect of High-Energy Radiation on Mixtures of Vinyl or related Polymers with Unsaturated Compounds (B. J Lyons), 604
Effect of β-Hydroxybutyrate Injections on the Pancreatic Activity of Guinea Pigs and Rats (Prof. A Schwartz, J. Manta, J Madar and Z. Kis), 771
Effect of Infection by *Xanthomonas malvacearum* (E.F.S) Dowson on Respiration-rate of Cotton Leaves (Dr. H. M. Hassan and K. A. Sabet), 177
Effect of Injection of a Hepatotoxin directly into the Gall-Bladder of Rabbits (Dr. N A. Worker), 785
Effect of Inorganic Sulphate on Molybdenum Excretion by a Marsupial (Shelley Barker), 41
Effect of Ionizing Radiation upon Xanthosine in Dilute Aqueous Solution (Dr. G. Hems), 525
Effect of Kinetin on Glucose Metabolism of Chicken Embryo Fibroblasts (Dr. S. Halevy and Lydia Avivi), 388
Effect of Latitude on the Diurnal Maximum of 'Dawn Chorus' (Joseph H. Pope), 87
Effect of Micro-organisms on the Development of Roots and Root Hairs of Subterranean Clover (*T. subterraneum*), (A. D Rovira and G. D. Bowen), 260
Effect of Moisture Changes on Creep in Wood (L. D Armstrong and R. S T. Kingston), 862
Effect of Nitroacridine 3663 on Synthesis of Deoxyribonucleic Acid and Multiplication of T_2 Phage (Dr. G. Dénes and Dr. L. Polgár), 386
Effect of Parathyroid Extract on Citric Acid Concentration in the Rat Kidney (A. Komárková, J. Vostál and V Pacovsky), 173
Effect of Potassium on Muscle Tension, especially on that of Vascular Muscle (Prof. L Laszt), 696
Effect of Small Doses of Alcohol on a Skill resembling Driving (Prof. G. C. Drew, W. P. Colquhoun and Hazel A. Long), 354
Effect of Salicylate on the Activity of Plasma Enzymes in the Rabbit (I Janota, C. W. Wincey, M. Sandiford and Dr. M J. H Smith), 935
Effect of Selection on the Frequency of Genotypes determining Incompatibility in *Prunus avium* (Watkin Williams and J. S. Gale), 944
Effect of Soap on the Diffusion of Water through Isolated Human Epidermis (F. Ray Bettley and Elaine Donoghue), 17
Effect of Soil Drying on the Viability of *Heterodera major* Cysts (J. J. Duggan), 554
Effect of Streptomycin on *Escherichia coli*—Damage by Streptomycin to the Cell Membrane of *Escherichia coli* (Nitya Anand and Dr. Bernard D. Davis), 22 ; Uptake of Streptomycin by *Escherichia coli* (Nitya Anand, Dr Bernard D. Davis and Alan K. Armitage), 23
Effect of Streptomycin on the Incorporation of Tyrosine labelled with Carbon-14 into Protein of *Mycobacterium* Cell Fractions *in vivo* (Dr. T. Erdos and Dr. Agnes Ullmann), 100
Effect of Sulphydryl Group Reagents on Tryptophanase Activity (J. M. Turner and Prof. Frank C. Happold), 763
Effect of Testosterone Propionate and Insulin on Muscle Cholinesterase Activity (A N. Granitsas, N. Dede and Dr A. J. Philippu), 320
Effect of Ultrasonic Insonation on the Carbon Tetrachloride–Water–Dissolved Helium System (Martin R Levy), 159
Effect of Ultra-violet Light on the Shape and Size of Deoxyribonucleic Acid (Dr. P. Alexander and Dr. H. Moroson), 678
Effect (Damaging), of Drying on *Vicia faba* Seeds (Dr. W. Klingmüller and Dr. G. R Lane), 699
Effect (Paradoxical), of Magnesium Ions on Blood Coagulation (R. G. Huntsman, B. A L. Hurn and Dr. H. Lehmann), 852
Effect (Pumping), of a Gas Discharge High-vacuum Pump (Libor Páty), 674
Effect (Rhizosphere), on Soil Algae (W Hadfield), 179
Effect (A Sidewall Friction), during Soil Consolidation (Dr. Carl B. Crawford), 371
Effect (Vasodepressor), of Adenosine Phosphates and 5'-Adenylmethylenediphosphonic Acid, an Analogue of Adenosine Triphosphate (James W. Flesher, Dr. Y. T. Oester and T. C Myers), 772
Effective Viscosity . Sedimentation and (Dr. D. R. Oliver), 912 ; (Prof. G. J. Kynch), 913
Effectiveness of Dietary Substances in reducing the Retention of Chronically Ingested Radiostrontium—Studies with Tannin (Prof. R. H. Wasserman and Dr. C L. Comar), 629
Effects of Dehydration on the Mitochondria of the Mouse Kidney (Mikko Niemi, N. Schor and Dr. A. G E. Pearse), 786
Effects of Gibberellic Acid on Excised Pea Roots (Dr. R. C. Pecket), 114
Effects of the Method of Tissue Preparation on the Assay of Tissue Enzyme Activities (Dr. Sjoerd Bonting and Ira M. Rosenthal), 686
Effects of Reserpine, Serotonin and Vasopressin on the Survival of Cold-Stressed Rats (R. Michel Zilberstein), 249
Effects of Starvation on the Ability of Isolated Rat Diaphragm to Incorporate Labelled Amino-Acids into its Protein and to Respond to the Influence of Insulin on this Process (Dr. K L. Manchester), 907
Effects (Acute), of Radiation : Protection against, by Hypoxia (Dr. Patricia J. Lindop and Prof. J. Rotblat), 593
Effects (Antithyroidal), of some Fresh Plants on Guinea Pigs (Dr. P. Langer), 174
Effects (Biological), of Aromatic Extracts from Urine of Schizophrenics (Dargut Kemali), 540
Effects (Certain Mitotic), of Kinetin, Gibberellic Acid, Indoleacetic Acid and Maleic Hydrazide on the Root of *Allium cepa* (M. Annunciata McManus), 44
Effects (Pharmacodynamic and Placebo), in Drug Evaluations in Man · Interactions between (Dr. Walter Modell and Dr. Margaret Garrett), 538
Effects (Solar and Diurnal), in the High Atmosphere by Artificial Satellites : Measurement of (H. A. Martin and Dr. W. Priester), 600
Effects (Thermo-magnetic), in Liquids (R. C. Saxena, J. N. Tandon and S. P. Talwar), 158
Effets des Rayonnements de grande énergie sur les Polymeres (A. Charlesby), *review* by Dr. W. Anderson, 202
Efficiency (Column), in Gas-Liquid Chromatography : Effect of Flow-Rate and Sample-Size on (Prof. Richard A. Bernhard), 311
Egami, Prof. Fujio (Sato-Asano, Kimiko, and) : Ribonucleases in Takadiastase, 462
Egeland, A., and others : Correlation of Audio-Frequency Electromagnetic Radiation with Auroral Zone Micropulsations, 148
  A Day-time Maximum of Oblique Auroral Reflexions observed in the Auroral Zone, 519

Egg (Fish) Counter : An Automatic (B. B. Parrish, I G. Baxter and M. J. D. Mowat), 777
Eggeling, Dr. W. J. : Elected a Fellow of the Royal Society of Edinburgh, 734
Eggs of the Desert Locust : Fertilization of, by Spermatozoa from Successive Copulations (Philip Hunter-Jones), 336
Eggs (Amphibian) : Incorporation of Tritiated Uridine into (N. Bielavsky and R. Tencer), 401
Ehrlich Ascites Tumour Cells : Action of Antibodies and Plasmin on (Dr. I. Ginsburg and M. Ram), 328
Ehrlich's Ascites Tumour Cells Activity of a Substance extracted from the Fermentation Products of *Acetobacter aceti* on (G. A. Lanzani and A. Pecile), 175
Einstein (Albert) Gold Medal and Award for 1960 awarded to Prof. Leo Szilard, 893
Einstein's Principle of Equivalence : Experiments to Test (Dr. T. E Cranshaw and Dr. J. P. Schiffer), 653
Eire · Potassium–Argon and Rubidium–Strontium Ages of some Granites from Britain and (Prof. J. L. Kulp, Dr. L E. Long, C. E Giffin, Dr. A. A. Mills, Dr. R. StJ. Lambert, Dr. B. J Giletti and Dr. R. K. Webster), 495
Ejaculation Frequency : Influence of, on the Time required for Sperm Formation and Epididymal Passage in the Bull (Dr H. H Koefoed-Johnsen), 49
El Tannir-Lomba, J. (Sironval, C., and) Vitamin E and Flowering of *Fragaria vesca* L. var. *semperflorens* Duch , 855
Elasmobranch *Raja clavata* : A Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the, in Terms of Directional Sensitivity (Prof O Lowenstein and J Wersall), *errata*, 76
Elasmobranch Pituitary A Neurohypophyseal Principle in the (Dr. A. M. Perks, Dr M H. I. Dodd and Dr J M Dodd), 850
Elastic Moduli of Tin : Dependence on Temperature of (P. Jayarama Reddy and S V. Subrahmanyam), 29
Elastin Gel : An (Dr. Norman H. Grant and Dr. Kenneth C. Robbins), 320
Elcontrol, Ltd : Appointment of B. A. Worswick as technical director with a seat on the Board, 76
Electrical Engineers, Institution of : Presidential Address, The Making of Professional Engineers (Sir Willis Jackson), 5
  Faraday Lecture, Electrical Machines (Prof. M. G. Say), 215
  Election of Colonel B. H Leeson and Dr. Richard L. Hearn to honorary membership, 431
  Faraday Medal awarded to Sir George Thomson, 431
Electrical Machines (Prof M G. Say), 215
Electricity Generating Board, Central . Research Fellowship in the Physical Sciences, 286
  Research on Coal Utilization, 431
Electrical Resistivity of Age-hardening Alloys : Influence of Guinier–Preston Zones on the (C. W Morley and B. D. Burns), 914
Electricity (Atmospheric) . Recent Advances in—Proceedings of the Second Conference on Atmospheric Electricity, Portsmouth, New Hampshire, 1958 (edited by L. G Smith), *review* by Dr. F. J. Scrase, 131
Electrochromatography · A Synergic Method of Carrying out Continuous (Dr. S. R. Caplan), 378
Electrode Processes at the Dropping Mercury Electrode : Influence of Nitrogen–containing Bases on the Rate of the (V. Volková), 743
Electrode (Dropping Mercury) · Influence of Nitrogen-containing Bases on the Rate of the Electrode Processes at the (V. Volková), 743
Electrodeposition of Chromium : Oscillographic Investigation of (Hideya Okada, Kenji Nakamura and Takeo Ishida), 377
Electrodes (Simple Non-gassing), for Use in Electrophoresis (Rex Neihof and Sigmund Schuldiner), 526
Electrolyte : Flow of, within a Propagating Stress-Corrosion Crack (J. M. West), 92
Electrolyte Solutions (Prof. R A. Robinson and Prof. R. H. Stokes), second edition, *review* by Dr. J. N. Agar, 274
Electrolyte and Water Content of the Organs · Correlation between the, and Hypertension after Administration of Corticosteroids (Prof. L. Laszt), 695
Electrolytes : Solutions of, *review* by Dr. J. N. Agar, 274
Electrolytic Solutions : The Physical Chemistry of (Prof Herbert S. Harned and Prof Benton B. Owen), third edition, *review* by Dr. J. N. Agar, 274
  The Structure of (edited by Walter J. Hamer), *review* by Dr. J. N. Agar, 274
Electromagnetic Radiation (Audio-Frequency) : Correlation of, with Auroral Zone Micropulsations (Dr. J. Aarons, G. Gustafsson and A. Egeland), 148
Electron Bombardment in Rock Salt : Dark Blue Ring developed by (S. Yoshida and T. Ikeda), 755
Electron Density in the Ionosphere : Variation of, with Magnetic Dip (Sheila Croom, Audrey Robbins and J. O. Thomas), 902
Electron Mass . Ratio of Nucleon Mass and (Dr R. L Worrall), 602
Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* in Terms of Directional Sensitivity . A Functional Interpretation of the (Prof O. Lowenstein and J. Wersall), *errata*, 76
Electron Microscopy : Co-ordination of Light and (Royal Microscopical Society and the Electron Microscopy Group of the Institute of Physics Discussion on), 660
  Study of Life-cycle of *Schizosaccharomyces octosporum* by means of Ultra-thin Sectioning and (S F. Conti and Prof. H B Naylor), 633
Electron Microscopy of the Golgi Apparatus (Dr. Owen L Thomas), 703
Electron Multiplication (Transmitted Secondary) : An Image Intensifier with (W. L. Wilcock, D. L. Emberson and B. Weekley), 370
Electron Paramagnetic Resonance Observations on Irradiated Thiols and Disulphides (T Henriksen and A Pihl), 307
Electron–Phonon Interactions in Solids (Physical Society Conference on), 586
Electron Spin Resonance of γ-Irradiated, Substituted Toluenes (N. K. Bridge), 30
Electron Spin Resonance Absorption of the Biradical Molecular Complex, *p*-Phenylenediamine-chloranil (Dr. Y. Matsunaga and Prof. C. A McDowell), 916
Electron-dense Crystallites in Nuclei of Human Amnion Cells infected with Measles Virus (Richard F Baker, Prof Irving Gordon and Fred Rapp), 790
Electronic Sector-Scanning Asdic, an Improved Fish-Locator and Navigational Instrument (Prof D. G. Tucker and Dr. V. G. Welsby), 277
Electronics Weekly (Heywood and Co , Ltd.), 815
Electrophoresis . Simple Non-gassing Electrodes for Use in (Rex Neihof and Sigmund Schuldiner), 526
Electrophoresis (Immuno-) · Shape of the Precipitate in (Dr. Jan Hirschfeld), 164, *erratum*, 507
Electrophoretic Patterns of Haptoglobins in Apes (Dr. O. Makela, O. -V. Renkonen and Eeva Salonen), 852
Electrophoretic (Immuno-) Technique : Inheritance of a New Group-Specific System demonstrated in Normal Human Sera by means of an (Dr. Jan Hirschfeld, the late Bengy Jonsson and Marianne Rasmuson), 931
Electrophoretic (A Starch Gel Immuno-) Analysis of Human Globulin demonstrating the Inter- and Intra-Specific Variation of Organisms (Dr. Morris Goodman), 474
Electrophoretograms (Paper) · Scanning of, after Protein Dyeing with Bromocresol Green (A. Clark), 243
Elementary Astronomy (Prof. Otto Struve, Beverly Lynds and Helen Pillans), *review* by Dr. R. H. Garstang, 130
Elementary Particles, *review* by Prof. D H Wilkinson, 200
  The Theory of (Dr J. Hamilton), *review* by Prof. D. H. Wilkinson, 200
Elements (Transition) . Variation with Temperature of the Magnetic Susceptibility of some (Dr. H Kojima, Dr R. S. Tebble and D. E. G. Williams), 90
Elliott, M. H. (Pitney, W. R , and) : Plasma Antihaemophilic-Factor Concentrations in the Australian Aborigine and in Conditions associated with Hyperglobulinaemia, 397
Elliott, Dr. R J. : Electron–Phonon Interactions in Solids, 587
Elliott, Dr. W. H. : Methylglyoxal Formation from Aminoacetone by Ox Plasma, 467
Ellis, R B , and others : Configuration of Inositol Phosphate in Liver Phosphatidyl Inositol, 37
Elminius modestus Darwin on the Isle of Cumbrae (Firth of Clyde), (H. T. Powell), 119
Elmore, Dr D. T. · Biochemical Practice, *review*, 797
Elongation of a Leprosy Bacillus (*Mycobacterium lepraemurium*) in a Cell-free Medium (Dr. P. D'Arcy Hart and Dr. R C. Valentine), 58
Elphick, A. R., and others . Powerful Adrenergic Neurone-blocking Agents related to Choline 2,6-Xylyl Ether Bromide, 925
Elson, Dr. D , and others Antibodies in Ribonucleoproteins, 317
Elucidation of the Life-cycle of *Fasciola hepatica* (H. S. Jefferies), 331 ; (Dr. Ben Dawes), 331
Embassy (British), in Moscow : Appointment of Dr. D. A. Senior as scientific attaché, 356
Embassy (United States), in Buenos Aires : Appointment of Prof. Neal Weber as science officer, 657
Embassy (United States), in London : Appointment of John B. Bateman as deputy science officer, 657
Embassy (United States), in New Delhi : Appointment of Earnest Watson as science officer, 657
  Appointment of David C. Rife as deputy science officer, 657
Embassy (United States), in Rio de Janeiro : Appointment of Harry W. Wells as science officer, 657
Embassy (United States), in Stockholm : Appointment of William Littlewood as deputy science officer, 657
Embassy (United States), in Tokyo : Appointment of Prof. Marshall Crouch as deputy science officer, 657
Emberson, D L., and others : An Image Intensifier with Transmitted Secondary Electron Multiplication, 370
Embrittlement of Tungsten and of Molybdenum (P. J. Burdon and G. L. Davis), 455
Embryo Fibroblasts (Chicken) : Effect of Kinetin on Glucose Metabolism of (Dr S Halevy and Lydia Avivi), 388
Embryo-Gametophyte Complex of *Pinus nigra* var. *austriaca* : Differentiation induced as Season Advances in the, using Indole Acetic Acid (Prof. Norman W. Radforth and Dr. J. M. Bonga), 332
Embryonic Mortality (Early), in Temporarily Fasted Mice : Use of Chorionic Gonadotropin to prevent (T. J. McClure), 622
Embryonic System · Evidence for Protein Turnover in an (Dr. Harry R. Walter and Prof. H. R. Mahler), 398
Embryos (*Musa balbisiana* Colla) · *In vitro* Culture of (Elsie A. Cox, G. Stotzky and Roger D. Goos), 403
Embryos (Whole Mouse) : Influenza A' Infection of Cultured Cells of (J. V T. Gostling), 328
Emeleus, V. M., and Simpson, G. : Neutron Activation Analysis of Ancient Roman Potsherds, 196
Emission (Exo-electron), and the Optical Properties of Oxide-coated Metal Surfaces (J. A. Ramsey), 602
Emission Spectroscopy with Infra-Red Double-Beam Spectrophotometers (J Braunbeck), 754
Emission and Absorption of Light behind the Detonation Front (Prof. C. H. Johansson and T. Sjolin), 523
Emmelin, Prof. N. · Is there a Leakage of Acetylcholine from Postganglionic Parasympathetic Nerve Endings ?, 297
Employment of Scientists in the United States, 890
Employment Service (Youth), and Youth Service Grants (Seventh Report from the Select Committee on Estimates), 874
Enamel (Mineralized Human) : Preparation of Ultra-Thin Sections of (R. W. Fearnhead), 550
Enamel Organic Matrix : Birefringence of the (J. H. Allan), 402
Encephalomyocarditis Virus : Role of Infective Nucleic Acid in the Production of (Dr F. K. Sanders), 802
Endemic Goitre in Australia · Plant Thioglycosides and the Problem of (H. S. Bachelard and Prof. V. M. Trikojus), 80
Endocrine Systems · Cyclical Activity in (Zoological Society of London Symposium on), 663
Endogenous Carcinogenic Substance : 'Carcinolipin', an (Dr. J. Hradec and Dr. J Kruml), 55
Endogenous α-Ketoglutaric and Pyruvic Acid in Man : Clearances of (Dr. Eman Zelníček), 928
Endogenous Rhythm (A Temperature-dependent), in the Rate of Carbon Dioxide Output of *Periplaneta americana* (Dr. M. B. Wilkins), 481
Energy in Great Britain Production and Consumption of (Prof R J. Sarjant), 896

Energy in the United Kingdom—the Changing Scene (Sir Harold Hartley), 896
Energy (Gravitational Potential) : An Expanding Earth with Loss of (Prof. A. E. Beck), 677
Energy (High-) Radiation : Effect of, on Mixtures of Vinyl or related Polymers with Unsaturated Compounds (B. J. Lyons), 604
Energy (Low-) Cosmic-Rays : Solar Radio Bursts and (Dr. A. R. Thompson and Dr. A. Maxwell), 89
Energy (Low-) X-Rays from Interplanetary Space (Dr. L. Reiffel), 229
Energy-linked Reduction of Mitochondrial Pyridine Nucleotide (Prof. Britton Chance and Dr. Gunnar Hollunger), 666
Energy-trapping Centres in Photosynthesis (F. W. J. Teale), 775
Eng, Dr. Lie-Injo Luan, and Hie, Dr. Jo Bwan : A Fast-moving Haemoglobin in Hydrops Foetalis, 698
Engineer : Geophysics for the, *review* by Dr. T. F Gaskell, 200
Engineer (Woman) : Exhibition for a (Caroline Haslett Memorial Trust), 736
Engineering : Chemical Reaction (European Federation for Chemical Engineering second European Symposium on), 507
  Variety Reduction in (Borough Polytechnic, London, Course of Lectures on), 286
Engineering-Apprenticeship Scheme (Post Office), 146
Engineering (Chemical), at Swansea, 578
Engineering (Chemical) · Shell Department of, Cambridge, 287
Engineering (Chemical), European Federation for Second European Symposium on Chemical Reaction Engineering, 507
  Symposium on Distillation, 660
Engineering (Civil), at Manchester, 212
Engineering (Structural) · Research Scholarship in the Use of Light Alloys in (Institution of Structural Engineers and the Aluminium Development Association), 356
Engineering Handbook : Nuclear (edited by Harold Etherington), *review* by Prof. W. Murgatroyd, 4
Engineering Projects, 1958 · Geophysical Surveys in Mining, Hydrological and, *review* by Dr. T F. Gaskell, 200
Engineers in American Industry Scientists and (United States National Science Foundation), 213
Engineers and Technical Industrialists : Nuclear Energy for (European Nuclear Energy Agency of the Organization for European Economic Co-operation Courses on), 506
Engineers (Electrical), Institution of . Presidential Address, The Making of Professional Engineers (Sir Willis Jackson), 5
  Faraday Lecture, Electrical Machines (Prof M. G. Say), 215
  Election of Colonel B. H. Leeson and Dr. Richard L Hearn to honorary membership, 431
  Faraday Medal awarded to Sir George Thomson, 431
Engineers (Mechanical), Institution of : James Clayton Prize for 1959 awarded to C. Bernard Dicksee and Prof. G Fernie Mucklow, 814
Engineers (Professional) : The Making of (Sir Willis Jackson), 5
Engineers (Professional), in Britain, 5
Engineers (Structural), Institution of : Grant of £2,000 per annum for seven years to the University of Southampton, to provide for the establishment of a readership in structural engineering in the Department of Civil Engineering, 215
Engineers (Structural), Institution of, and the Aluminium Development Association : Research Scholarship in the Use of Light Alloys in Structural Engineering, 356
Engineers (Television), Society of Motion Picture and : International Congress on High-Speed Photography, 14
England · 'Teen-Age' Education in, 341 ; (Lady Simon of Wythenshawe), 712
England (Rural), Council for the Preservation of : Report for 1958-59, 580
England (South-West) : Uranium in, 213
England and Australia · Measurements of the Frequency of an Ammonia Maser in (A. M J Mitchell and E Sandbach), 833
England and Wales · Registrar General's Statistical Review of, for the Year 1955—Supplement on Hospital In-Patient Statistics (General Register Office), 214
  The Youth Service in (Ministry of Education), 873
Enhancement of the High-Spacing Meridional Reflexions in the X-Ray Photograph of Keratin impregnated with Heavy-Metal Salts (W. S. Simpson and H J. Woods), 157
Enhydrina schistosa : Isolation of the Neurotoxic Component of the Venom of the Sea Snake (Jocelyn E. Carey and Dr. E A. Wright), 103
Ennor, Prof A. H., and others Biosynthesis of Lombricine, 383
Entamoeba invadens in Snakes : Thermal Barrier to the Infectivity of (Dr. E. Meerovitch), 631
Entrance Requirements (Oxford) : Classical Languages in, 660
Entwistle, D. G. (Murrell, K. F. H., and) · Age Differences in Movement Pattern, 948
Environment · Plants and (Prof R. F. Daubenmire), second edition, *review* by W. Tutin, 799
  Reaction of Hibernators to various Low Temperatures of the (Dr. Zdenek Bartoš), 251
Environmental Radiation Research Group : Established by the Medical Research Council in the Department of Medical Sciences, University of Leeds, 215
Environments (Simulated Pond, Wet Meadow and Irrigated Field) : Accu-[redacted] Caesium-137 by Plants grown in (Dr R C. Pendleton and [redacted]ler), 707
Enzymatic Cycle of Inorganic Nitrogen in Animal Tissues (Dr. K. Yamafuji, Y. Osajima and H. Omura), 162
Enzyme (Trypsin-like), in Mast Cells : Histochemical Demonstration of a Species-Specific (G G Glenner and L. A Cohen), 846
Enzyme Activities (Tissue) Effects of the Method of Tissue Preparation on the Assay of (Dr. Sjoerd Bonting and Ira M Rosenthal), 686
Enzyme-Level in Saliva : Erythrocyte Glucose-6-Phosphate Dehydrogenase-deficient Subjects— (Dr. Bracha Ramot, Chaim Sheba, Avinoam Adam and Israel Ashkenasi), 931
Enzymes (Oxidative), in Skeletal Muscle : Reciprocal Relationship of Phosphorylase and (Victor Dubowitz and Dr. A. G. Everson Pearse), 701
Enzymes (Plasma), in the Rabbit . Effect of Salicylate on the Activity of (I. Janota, C. W Wincey, M. Sandiford and Dr. M J H. Smith), 935
Enzymic Oxidation and Translocation of Flavonoids . Effect of Glycosylation on the (Dr. E. A H. Roberts), 536
Enzymic Reactions involving Mevalonic Acid : Stereospecificity of (Rita H. Cornforth, K. Fletcher, Hermione Hellig and Dr. G Popják), 923
Enzymic Synthesis of L-Aspartate-4-^{14}C (G. G. Dearing and Dr. D. A. Walker), 690
Epidermis (Isolated Human) : Effect of Soap on the Diffusion of Water through (F. Ray Bettley and Elaine Donoghue), 17
Epididymal Passage in the Bull : Influence of Ejaculation Frequency on the Time required for Sperm Formation and (Dr. H H. Koefoed-Johnsen), 49
17-*Epi*oestriol Isolation of, from the Urine of Pregnant Women (Dr. H. Breuer), 613
Epstein, Emanuel · Calcium–Lithium Competition in Absorption by Plant Roots, 705
Epstein, Dr. H. T , and others Fluorescence Studies of Chloroplast Development in *Euglena*, 825
Equivalence : Experiments to Test Einstein's Principle of (Dr. T. E. Cranshaw and Dr. J. P Schiffer), 653
Erdos, Dr T , and Ullmann, Dr. Agnes : Effect of Streptomycin on the Incorporation of Tyrosine labelled with Carbon-14 into Protein of *Mycobacterium* Cell Fractions *in vivo*, 100
Ergonomics in the Armed Forces (Ergonomics Research Society), 356
Ergonomics in the Netherlands (Ergonomics Research Society), 356
Ergonomics Research Society : Conference, 356, 893
  Session on Ergonomics in the Armed Forces, 356
  Session on Ergonomics in the Netherlands, 356
  Symposium on Factors in Prolonged Work, especially Inspection, 356, 893
Ergot Alkaloids · Biosynthesis of (Ross M. Baxter, S. I. Kandel and A. Okany), 241
Ergun, Sabri, and others : Reduction of Graphite by Lithium-Ethylenediamine, 379
Ericson, L -E. : Transmethylation in *Anodonta cygnea*, 465
Erosion of Meteorites in Space and the Density of Interplanetary Gas (Dr. L. Reiffel), 821
Error : Fitting r Linear Relations to n Variables all Liable to (M. H. Hey and E. N. Hey), 338
  Spectrophotometric Determination of Tryptophan by the Method of Roth and Schuster—some Sources of (Ivan Larsen), 316
Erythrocyte Ghosts (Human) . Retention of Potassium by (Dr. J. F. Hoffman, Dr D. C. Tosteson and Dr. R Whittam), 186
Erythrocyte Glucose-6-Phosphate Dehydrogenase-deficient Subjects—Enzyme-Level in Saliva (Dr Bracha Ramot, Chaim Sheba, Avinoam Adam and Israel Ashkenasi), 931
Erythropoietin Inactivation of, by Neuraminidase and by Mild Substitution Reactions (Dr Peter H Lowy, Dr Geoffrey Keighley and Dr Henry Borsook), 102
Erythropoietin (Plasma), in Polycythaemia Secondary to Renal Disease (R W Payne, N F. Jones and R. D. Hyde), 549
Escarpment (Gritstone), in Derbyshire . Bedrock Corrosion and Drainage Initiation by Seepage Moisture on a (B T Bunting), 447
Escherichia coli · Damage by Streptomycin to the Cell Membrane of (Effect of Streptomycin on *Escherichia coli*), (Nitya Anand and Dr. Bernard D. Davis), 22
  Effect of Streptomycin on—Damage by Streptomycin to the Cell Membrane of *Escherichia coli* (Nitya Anand and Dr. Bernard D. Davis), 22 ; Uptake of Streptomycin by *Escherichia coli* (Nitya Anand, Dr. Bernard D Davis and Alan K. Armitage), 23
  Mutagenic Action of Mitomycin C on (Teiji Iijima and Atsuyoshi Hagiwara), 395
  Uptake of Streptomycin by (Effect of Streptomycin on *Escherichia coli*), (Nitya Anand, Dr Bernard D Davis and Alan K. Armitage), 23
  Role of the Inducer in the Induced Synthesis of β-Galactosidase in (Prof. H. V Rickenberg), 240
Escherichia coli B Antigens of Spheroplast Membrane Preparations from (Dr. T Holme, A. -S. Malmborg and E. Cota-Robles), 57
Escherichia coli K12 : Role of *Hfr* Mutants in $F+ \times F-$ Crosses in (P. Reeves), 265
ESP : the Case for, *review* by Dr E J. Dingwall, 646
  Experimental Evidence for (Dr. S. G. Soal), 949 ; (C. E M. Hansel), 950
Espersen, J. : Mining Geophysics (Magnetic and Gravimetric Measurements at Svappavaary), 436
Essential Amino-Acid for the Growth of a Strain of *Shigella dysenteriae* 1 (*Sh shiga*) : Cystine as an (Dr. Ranjit Sen), 267
Essential Oil of *Acorus calamus* L. of Indian Origin : Separation of the Hypnotic Potentiating Principles from the, by Liquid–Gas Chromatography (Ross M Baxter, P C. Dandiya, S. I. Kandel, A. Okany and Prof G. C. Walker), 466
Ester-like Groups in Different Collagens and Gelatins (Dr. Jake Bello), 241
Estimates, Select Committee on · Seventh Report from the (The Youth Employment Service and Youth Service Grants), 874
Estimation of the Cellular Lethal Dose and the Critical Cell Number for the *C3H* Mouse Mammary Carcinoma from Radiosensitivity Studies *in vivo* (A Cohen and L Cohen), 262
Estimations (Quantitative), of Populations of the River Crab, *Potamon* (*Potamonautes*) *perlatus* (M. Edw.), in Rhodesian Trout Streams (Peter St. J Turnbull-Kemp), 481
Etherington, Harold (edited by) : Nuclear Engineering Handbook, *review* by Prof W Murgatroyd, 4
Ethylenediamine (Lithium-) : Reduction of Graphite by (Raphael Raymond, Leslie Reggel, Waldo A. Steiner, Sabri Ergun and Irving Wender), 379
Euglena : Fluorescence Studies of Chloroplast Development in (Dr. H. T. Epstein, E. Boy de la Tour and Dr. Jerome A Schiff), 825
Euler, Leonhard : Lettere a una Principessa Tedesca (a cura di Gianfranco Cantelli), *review* by L. Roth, 717
Euler (Galileo and), as Popular Expositors, *review* by L Roth, 717
Euro, the Tammar and the Marloo : Delayed Birth in Marsupial Macropods—the (R M. Sadleir and J W Shield), 335
Europe : Education and Training in Nutrition in (Food and Agriculture Organization and the World Health Organization of the United Nations Symposium on), 585
European Association of Exploration Geophysicists Geophysical Surveys in Mining, Hydrological and Engineering Projects, 1958, *review* by Dr T F. Gaskell, 200
European Ceramic Association : Seventh International Congress, 660
European Economic Co-operation, Organization for (European Nuclear Energy Agency of the) : Courses on Nuclear Energy for Engineers and Technical Industrialists, 506

European Federation for Chemical Engineering : Second European Symposium on Chemical Reaction Engineering, 507
  Symposium on Distillation, 660
European Nuclear Energy Agency of the Organization for European Economic Co-operation : Courses on Nuclear Energy for Engineers and Technical Industrialists, 506
European Organization for Nuclear Research : Grant of 500,000 dollars from the Ford Foundation, 146
  The CERN Proton Synchrotron (J B. Adams), 568
European Symposium on Chemical Reaction Engineering (European Federation for Chemical Engineering), 507
Eutectoid Alloy (Copper–Indium) · Decomposition of the Beta-Phase in a (D. A. Moore, M. White and Dr. D. R. F. West), 454
Evaluations (Drug), in Man : Interactions between Pharmacodynamic and Placebo Effects in (Dr. Walter Modell and Dr. Margaret Garrett), 538
Evans, E. Price : *Obituary* by Prof P. W. Richards, 732
Evaporation from Reservoirs : Preventing (W. W. Mansfield), 581
Evaporation in Young Lambs : Loss of Heat by (G. Alexander and A. H. Brook), 770
Evaporation Figures on the Surface of Sodium Chloride Crystals (Gy. Turchányi and T. Horváth), 601
Evidence for the Existence of a Potassium Rhenium Hydride and its Bearing on the Nature of the (–1)-Oxidation State of Rhenium (A. P. Ginsberg, J. M. Miller, J. R. Cavanaugh and B. P. Dailey), 528
Evidence for the Hexose Monophosphate Pathway for the Glucose Metabolism in Human Pancreatic β-Cells (Dr. James B. Field, Phyllis Johnson, Betty Herring and Arnold N. Weinberg), 468
Evidence for Protein Turnover in an Embryonic System (Dr. Harry R. Walter and Prof. H R. Mahler), 398
Evidence from Satellite Orbits : Variation of Upper-Atmosphere Density with Latitude and Season—Further (D. G. King-Hele and D. M. C. Walker), 727
Evidence for Tertiary Crustal Distortion in Mid-Argyll (Dr. J. L. Knill), 234
Evidence (Experimental), for Extra-Sensory Perception (Dr. S. G. Soal), 949 ; (C. E. M. Hansel), 950
Evidence (Histochemical), of Aminopeptidase Activity in Rat Pineal Gland (Dr. Mikko Niemi and M. Ikonen), 928
Evolution of Arborvirus Diseases (Royal Society of Tropical Medicine and Hygiene Symposium on), 740
Evolution for the General Reader, *review* by T. H. Hawkins, 65
Evolution of Mankind, 411
Ewes maintained on High Intakes of Sulphate and Molybdate : Demyelination in Lambs born of (C. F. Mills and B. F. Fell), 20
Ewes' Urine 17-Oxosteroids of Pregnant (Dr. W. F. Coulson), 612
Ewing, Prof. Maurice : Awarded the Vetlesen Prize of Columbia University, 888 ; work of, 888
Exact Solutions in Concentration-dependent Diffusion : A Very General Class of (J. R. Philip), 233
Examination (Physiological), of a Live Whale (Dr. John W. Kanwisher and Dr. Alfred W. Senft), 13
Excavating Ape-Men (Dr. J. T. Robinson), 214
Exchange of Students for Technical Experience, International Association for the : Students exchanged during the Summer Vacation of 1959, 355
Exchange (Deuterium–Hydrogen), between Water and Macromolecules—Accessibility of Cellulose (Dr. John L. Morrison), 160
Exchange (Ionic), and the Structure and Function, including Motility, of Cytoplasmic Membranes (Dr. W. E. Hutton), 439
Exchange System (Thiol), with Thiolbenzoic Acid (I. A. M. Ford and S. A. M. Thompson), 96
Exchangers : Heat—Applications to Gas Turbines (Dr. W. Hryniszak), *review* by R. W. Haywood, 66
Exchangers (Heat) : Heat Transfer and, *review* by R. W. Haywood, 66
Excised Pea Roots : Effects of Gibberellic Acid on (Dr. R C. Packet), 114
Excretion of Rose Bengal in Bile (Prof. Gunnar Biorck, Prof. Sven Gardell, Gunnar Carlberger and Leo Meurman), 847
Excretion (Molybdenum), by a Marsupial : Effect of Inorganic Sulphate on (Shelley Barker), 41
Exhibit on Rocket Astronomy lent to the Science Museum, London, by the United States Naval Headquarters, 215
Exhibition : Twelfth Technical (Association of Oil and Colour Chemists), 286
Exhibition for a Woman Engineer (Caroline Haslett Memorial Trust), 736
Existence of a Potassium Rhenium Hydride : Evidence for the, and its Bearing on the Nature of the (–1)-Oxidation State of Rhenium (A. P. Ginsberg, J. M. Miller, J. R. Cavanaugh and B. P Dailey), 528
Exo-electron Emission and the Optical Properties of Oxide-coated Metal Surfaces (J. A. Ramsey), 602
Exogenous Respiration in *Nitrobacter* (Prof. W. S. Silver), 555
Exosphere : Global Hydromagnetic Wave Ducts in the (H. A. Bomke, W. J. Ramm, S. Goldblatt and V. Klemas), 299
Expanding Earth with Loss of Gravitational Potential Energy (Prof A. E. Beck), 677
Expansion of the Earth : Some Consequences of (Prof. J. Tuzo Wilson), 880
Expansion (Thermal), Perpendicular to the Layer Planes of Artificial and Natural Graphites (E. G. Steward and B. P. Cook), 78
Expansion (Thermal), of Triglycine Sulphate (S. Ganesan), 757
Experimental Biology, Federation of American Societies for: Forty-fourth Annual Meeting, 893
Experimental Evidence for Extra-Sensory Perception (Dr. S. G. Soal), 949 ; (C. E. M. Hansel), 950
Experimental Physics at Liverpool, 284
Experimental Technique : Humane (Universities Federation for Animal Welfare Symposium on), 893
Experimental Test of Verwey and Overbeek's Theory (B. K. Choudhury), 308
Experimental Transformation of Cells (Dr. Honor B. Fell), 882
Experimentally Induced Proliferation of the Rudimentary Gonad of an Intact Domestic Fowl (Prof. W. Kornfeld), 320
Experiments with Plasma Rings (L. Lindberg, E. Witalis and C. T. Jacobsen), 452
Experiments to Test Einstein's Principle of Equivalence (Dr. T. E. Cranshaw and Dr. J. P. Schiffer), 653
Experiments (Russian) : Microbial Variation and, *review* by Dr. E. F. Gale, 344
Exploration for Petroleum and Natural Gas : Geochemical Methods of Prospecting and (A. A. Kartsev, Z. A. Tabasaranskii, M. I. Subbota and G. A. Mogilevskii), English translation edited by Paul A. Witherspoon and William D. Romey, *review* by Dr. John S. Tooms, 876
Exploration Geophysicists, European Association of : Geophysical Surveys of Mining, Hydrological and Engineering Projects, 1958, *review* by Dr. T. F. Gaskell, 200
Explosion Limit (Second), of Dried Carbon Monoxide–Oxygen Mixtures (P. G. Dickens, J. E. Dove, J. F. Harrold and Dr. J. W. Linnett), 606
Explosions (High-Yield Nuclear) : Fall-out over Norway from (T. Hvinden, D Hveding, A. Lillegraven and S. H. Small), 805
Expositors (Popular) : Galileo and Euler as, *review* by L Roth, 717
Exposure to Adverse Conditions during Germination : Abnormal Growth and Development in Pea resulting from (Alex M. M. Berrie), 626
Exposure (Low-Dose Neutron) : Conditioned Avoidance Behaviour induced by (Dr. John Garcia and Dr. Donald J. Kimeldorf), 261
Exposure (Prolonged), to Moderate-Level Radiation : The Shuttle-Box Behaviour of Albino Rats during (Dr. John E. Overall, Dr. W. Lynn Brown and Dr. Loren C. Logie), 665
Extension (Stem), in Petkus Winter Rye: Effect of Gibberellin on the Flower Initiation and (Dr. O. N. Purvis), 479
Extermann, Prof. R C. (edited by) : Radioisotopes in Scientific Research—Proceedings of the International Conference held in Paris, 1957, under the auspices of Unesco, Vol. 1, Research with Radioisotopes in Physics and Industry ; Vol. 2, Research with Radioisotopes in Chemistry and Geology, *review* by Dr. H. Seligman, 415 ; Vol. 3, Research with Radioisotopes in Human and Animal Biology and Medicine , Vol. 4, Research with Radioisotopes in Plant Biology and some General Problems, *review* by Prof. Otto Hug, 876
External Potassium Concentrations (Low) : Resting Potentials in Isolated Frog Sartorius Fibres at (Dr. Roderick P. Kernan), 471
Extra-Sensory Perception : The Case for, *review* by Dr. E. J. Dingwall, 646
  Experimental Evidence for (Dr. S. G. Soal), 949 ; (C. E. M. Hansel), 950
Extracorporeal Circuits : Renal Affection resulting from Blood Trauma in (Dr. H. S. S. Sarajas and Dr. L. Saure), 768
Extract (Parathyroid) · Effect of, on Citric Acid Concentration in the Rat Kidney (A. Komárková, J. Vostál and V. Pacovsky), 173
Extraction (Attempted), of Crustacean Moulting Hormone from Isolated Y-Organs (Dr. Peter Karlson and Dorothy M. Skinner), 543
Extracts (Aromatic), from Urine of Schizophrenics : Biological Effects of (Dargut Kemali), 540
Extracts (Cell-free), of *Neurospora crassa* : Mediation of the Genetic Control of Protein Synthesis in (S. D. Wainwright), 314
Extracts (Cell-free), of *Nitrosomonas europaea* : Oxidation of Hydroxylamine in (Dr. D. J. D. Nicholas and Dr. O. T. G Jones), 512
Eye Closure : Relation of Eye Dominance and (S. T. Chan and Prof. K. S. F. Chang), 539
Eye Dominance and Eye Closure : Relation of (S. T Chan and Prof. K. S. F. Chang), 539
Eyles, Joan M. : Scientific Centenaries in 1960, 8

FACIAL Eczema of Sheep : A Hepatotoxin causing Liver Damage in (Dr. N. A. Worker), 909
Factor (A Peanut), for Haemostasis in Haemophilia (Prof. H. Bruce Boudreaux and Dr. Vernon L. Frampton), 469
Factor (Vascular Permeability) : Induction of a, by the Interaction of Guinea Pig Tissue Debris with Serum (Dr. P. J. Mill), 246
Factors in Prolonged Work, especially Inspection (Ergonomics Research Society Symposium on), 356, 893
Factors (Separation), in Gas Chromatography (W. A. Wiseman), 841
Faeces : Collection of Urine and, from the Chicken (Dr. M. H. Fussell), 332
Fahim, L., and others : Effect of Different Types of Milk on Intestinal Motility, 773
Failure of Growth in Disturbed Laboratory Rats (Dr. Hannah Steinberg and R. H. J. Watson), 615
Fairbairn, Dr. D. : Host Influence on Parasite Physiology (Physiology of Hatching and Larval Exsheathment in Nematodes), 898
Fall in Haematocrit in Sheep after Treatment with Chlorpromazine and Dihydroergotamine (Dr. A. W. Turner and V. Elizabeth Hodgetts), 43
Fall-out : Relationship between the Rate of, and the Concentration of Strontium-90 in Human Diet in the United Kingdom (Dr. J D. Burton, G. M. Milbourn and Dr. R. Scott Russell), 498
Fall-out over Norway from High-Yield Nuclear Explosions (T. Hvinden, D. Hveding, A. Lillegraven and S. H. Small), 805
Fall-out (Nuclear Bomb) · Increases in the Local Gamma-Ray Background due to (J. Vennart), 722
Falla, R. A. : The Biology of the Southern Cold Temperate Zone, 206
Faraday Lecture of the Institution of Electrical Engineers (Prof. M. G Say), 215
Faraday Medal of the Institution of Electrical Engineers awarded to Sir George Thomson, 431
Faraday Society · General Discussion on Oxidation Reduction Reactions in Ionizing Solvents, 893
Faraday Society (Colloid and Biophysics Committee) : Discussion on Cytoplasmic Particles and their Role in Protein Synthesis, 815
Fasciola gigantica Cobbold, 1856 : Penetration of, into Small Hosts (Dr. Ben Dawes), 51
Fasciola hepatica . Elucidation of the Life-cycle of (H. S. Jefferies), 331 , (Dr. Ben Dawes), 331
Fast-moving Haemoglobin in Hydrops Foetalis (Dr. Lie-Injo Luan Eng and Dr. Jo Bwan Hie), 698
Fasted Mice (Temporarily) : Use of Chorionic Gonadotropin to prevent Early Embryonic Mortality in (T. J. McClure), 622
Fat (Foetal Liver), in the Rabbit : Effect of Foetal Hypophysectomy on the (Dr. J. G. Bearn), 849
Fate (Man's) : Nature and (Prof. Garrett Hardin), *review* by T. H. Hawkins, 65
Fatigue (Metal) : A Model of (Dr. A. N. May), 303
Fats (Dietary), and Thrombosis (Dr. Torben Geill, Dr. Per From Hansen and Dr. Erling Lund), 330
Fatty Liver : Rare-Earth (Dr Fred Snyder, Edgar A. Cress and Granvil C. Kyker), 480

Faults on Rock Surfaces beneath the Sea : Recognition of Folds and (A. H. Stride), 837
Fearnhead, R. W. : Preparation of Ultra-Thin Sections of Mineralized Human Enamel, 550
Fearon, Prof. W. R : *Obituary* by Prof. W. J. E. Jessop, 283
Federal Funds for Science, 1958, 1959 and 1960 (United States National Science Foundation), 813
Federation of American Societies for Experimental Biology : Forty-fourth Annual Meeting, 893
Feedback Control of Tryptophan Biosynthesis (Dr. C. H. Doy and A. J. Pittard), 941
Feeding : Time of, in relation to the Toxicity of a Stomach Poison to the Desert Locust (R. D. MacCuaig and W. S. Watts), 335
Feeding (Chick), in the Wandering Albatross *Diomedea exulans* Linnaeus (W. L. N. Tickell), 116
Feeding (Nitrogen), of Apple Trees by Post-Harvest Urea Sprays (Dr. K. Oland), 857
Feeding Procedure : Reduction of the Radioactive Content of Milk by a (Dr. Robert H. Fetner and Dr. Randall W. Carter), 858
Feinberg, Dr J. G. : Quantitative Immuno-Analysis in Gel Plates, 555
Feinberg, Dr. R. : Awarded a grant of £545 from the Paul Instrument Fund (in supplement of a previous grant), for the construction of an instrument for measuring the intensity of soft X-radiation generated in experimental high-voltage valves, 504
Feldherr, Ailene B (Feldherr, Carl M., and) : The Nuclear Membrane as a Barrier to the Free Diffusion of Proteins, 250
Feldherr, Carl M., and Feldherr, Ailene B. : The Nuclear Membrane as a Barrier to the Free Diffusion of Proteins, 250
Feldman, Dr. M., and others : Antibodies in Ribonucleoproteins, 317
Fell, B. F. (Mills, C. F , and) : Demyelination in Lambs born of Ewes maintained on High Intakes of Sulphate and Molybdate, 20
Fell, Dr. Honor B. : Experimental Transformation of Cells, 882
Fellman, Prof. J. H. (Pathak, Dr. M. A., and) : Activating and Fluorescent Wavelengths of Furocoumarins:Psoralens, 382
Fellowship Awards for 1960 (United States National Science Foundation), 146
Fellowship (New Zealand National Research) for 1960 awarded to Dr. R. H. Hedley, 356
Fellowship (Research), in the Physical Sciences (Central Electricity Generating Board), 286
Fellowship Plan : Commonwealth Scholarship and (White Paper on the), 272
Fellowships : Studentships and (Department of Scientific and Industrial Research), 892
Fellowships in Chemistry : Ramsay Memorial, 432
Fellowships (Commonwealth) . South Africa and, 893
Fellowships (Gassiot Research), in Geomagnetism and Seismology (Meteorological Office), 892
Fellowships (Grants, Scholarships and), for Research on Diseases of the Blood (Lady Tata Memorial Trust), 433
Females (Codling Moth), (*Cydia pomonella* L.) caught in Bait and Light Traps : Physiological Age of (P. W. Geier), 709
Fenwick, Dr. D. W., and Maharaj, S. B. : Presence of *Aphelenchoides cocophilus* in the Roots of *Cocos nucifera*, the Coconut Palm, 259
Fermentation : International Symposium on (Istituto Superiore di Sanitá, the American Chemical Society (Fermentation Subdivision), and the Societá Chimica Italiana), 14
Fermentation Products of *Acetobacter aceti* on Ehrlich's Ascites Tumour Cells : Activity of a Substance extracted from the (G. A. Lanzani and A. Pecile), 175
Fernandez, Dr. Carmen Gil : Persistence of Herpes Simplex Virus in HeLa Cells, 268
Ferri, G , and others . Presence of Sialic Acid in Connective Tissues, 37
α-Ferric Oxide : Neutron Diffraction Study of Antiferromagnetic Spin Waves in (J. A. Goedkoop and T Riste), 450
Ferrite (Calcium) Phases : Two New Complex (Stig Holmquist), 604
Fertilization of Eggs of the Desert Locust by Spermatozoa from Successive Copulations (Philip Hunter-Jones), 336
Fetner, Dr Robert H., and Carter, Dr Randall W. : Reduction of the Radioactive Content of Milk by a Feeding Procedure, 858
Fibres (Glycerol-extracted Psoas) : Effect of Heavy Water on Different Types of Muscle and on (Dr. Benjamin Kaminer), 172
Fibres (Isolated Frog Sartorius), at Low External Potassium Concentrations : Resting Potentials in (Dr. Roderick P. Kernan), 471
Fibrinolytic Activity of Cirrhotic Liver (Dr. Tage Astrup, J. Rasmussen, A. Amery and H. E Poulsen), 619
Fibroblasts (Chicken Embryo) : Effect of Kinetin on Glucose Metabolism of (Dr. S. Halevy and Lydia Avivi), 388
Field, Dr. James B., and others : Evidence for the Hexose Monophosphate Pathway for Glucose Metabolism in Human Pancreatic β-Cells, 468
Field : Plant Physiology in the, *review* by W. Tutin, 799
The Study of Soil in the (G. R. Clarke), fourth edition, *review* by Dr. R. M. S. Perrin, 2
Field (Irrigated) Environments (Simulated Pond, Wet Meadow and) : Accumulation of Caesium-137 by Plants grown in (Dr. R. C. Pendleton and Dr. R. L Uhler), 707
Field-Slug *Agriolimax reticulatus* as a Vector of the Lungworm *Cystocaulus ocreatus* (Dr. J H. Rose), 180
Field Studies Association, Scottish : Programme for April-September, 355
F[illegible]der, G. : Observations related to the Impact of *Lunik II*, 11
15 to [illegible] of the Central Advisory Council for Education (England), Vol 1, Report (Ministry of Education), 341, 873
Figures (Evaporation), on the Surface of Sodium Chloride Crystals (Gy. Turchányi and T. Horváth), 601
Figures (Interlaminate), of Sessile Barnacle Shells (R. Read), 778
Film Transfer in He II (Prof. J. F. Allen), 831
Filming and of Surface Texture : Influence of, on the Settlement of Marine Organisms (Dr. D. J Crisp and J. S. Ryland), 119
Films (Titanium) . Sorption of Activated Gases by (L. Holland), 911
Fine Innervation of the Carotid Body of the Rhesus Monkey (R. P. Gould), 183
Firm (Smaller) : The Value of Instruments and Automatic Control to the (Society of Instrument Technology Conference on), 737
Firsoff, V. A. : Strange World of the Moon, *review* by Dr. B E. J. Pagel, 718
First Successful Hybrid between the Two Jute-yielding Species, *Corchorus olitorius* L. (Tossa), x *C. capsularis* L. (White), (Ahmad Shamsul Islam and A. Rashid), 258
Fish, Dr. J. B. : Basic Research, 716
Fish : Lack of Haemoglobin in a (Prof. A Stolk), 625
Fish (Dog-) : Abnormalities in the Urino-genital System of the Common (Dr. A S. Fuller and J M. Zacharov), 50
Fish (Gold-), *Carassius auratus* : Mitochondria of (Dr. M. S. Kanungo), 862
Fish (Hag-) : A Pale (B. Rybak), 777
Fish (Lung-), *Protopterus* : Action of Thyroxine on the Rate of Oxygen Consumption of the (Dr T. Mohsen and Dr R. Godet), 108
Fish Egg Counter : An Automatic (B. B Parrish, I. G. Baxter and M. J. D. Mowat), 777
Fish-Locator and Navigational Instrument : Electronic Sector-Scanning Asdic, an Improved (Prof D. G. Tucker and Dr. V. G. Welsby), 277
Fisher, Prof. R. B. Elected a Fellow of the Royal Society of Edinburgh, 734
Fisheries (Sea) : Forecasting the Annual Yield in (Prof. Per Ottestad), 183
Fisken, R. A., and others : A New Metabolite of Chloramphenicol, 535
Fission Products (Radioactive), in Lungs (Dr. T. Schonfeld, K. Liebscher, F. Karl and Christina Friedmann), 192
Fitter, R. S. R. : Birds and Forests, 731
The Ark in our Midst, *review* by Frances Pitt, 799
Fitting *v* Linear Relations to *n* Variables all Liable to Error (M. H. Hey and E. N Hey), 338
Fixation for Gel Precipitation : Glacial Acetic and Picric Acids as a (Dr. Bengt Bergrahm), 242
Fixation (Symbiotic Nitrogen), in a Grazed Tropical Grass–Legume Pasture (Dr. A. W. Moore), 638
Fixed Ammonium : Removal of, from Clay Minerals by Cation Exchange Resins (Prof. A. D. Scott, A. P. Edwards and Prof. J. M. Bremner), 792
Flagellate Spermatozoa : Position of the Proximal Centriole in (Prof. J. Bronte Gatenby and R. S. Mathur), 861
Flavonoids : Effect of Glycosylation on the Enzymic Oxidation and Translocation of (Dr. E. A. H. Roberts), 536
Flavonoids of the Ponderosa Lemon (Robert M. Horowitz and Bruno Gentili), 319
Flax : Conditioned Lines of (Dr. A. Durrant and H. Tyson), 60
Fleck, Sir Alexander : Elected president for 1960-61 of the Society of Chemical Industry, 737
Flesher, James W., and others : Vasodepressor Effect of Adenosine Phosphates and 5'-Adenylmethylenediphosphonic Acid, an Analogue of Adenosine Triphosphate, 772
Fletcher, K., and others : Stereospecificity of Enzymic Reactions involving Mevalonic Acid, 923
Flies (House-) : Sex-limited DDT-Resistance in (R. W. Kerr), 868
Flies (Tsetse), in Nigeria : Nocturnal Detection of, with Ultra-Violet Light (W. McDonald), 867
Flockhart, Dr. B. D. : Appointed a lecturer in physical chemistry at the Queen's University, Belfast, 14
Flora Europaea in Vienna (Dr. V. H. Heywood), 15
Flow of Electrolyte within a Propagating Stress-Corrosion Crack (J. M. West), 92
Flow (Blood), through Narrow Tubes (Dr Robert H. Haynes), 679
Flow (Superfluid) : Mechanism of (Dr. C. G Kuper), 832
Flow-Rate and Sample-Size : Effect of, on Column Efficiency in Gas-Liquid Chromatography (Prof Richard A. Bernhard), 311
Flow Studies with Porous Models : Optical Scanning of Liquid Concentration in (Dr. E. R. Deutsch), 675
Flower, J. W. : Appointed lecturer in aeronautical engineering at the University of Bristol, 736
Flower Differentiation in Petkus Winter Rye : Effect of Gibberellic Acid on (O. H. Caso, H. R. Highkin and D. Koller), 477
Flower Initiation and Stem Extension in Petkus Winter Rye : Effect of Gibberellin on the (Dr. O. N. Purvis), 479
Flowering of *Fragaria vesca* L var. *semperflorens* Duch.: Vitamin E and (C. Sironval and J. El Tannir-Lomba), 855
Fluctuations (Sea-Level), during the Past Four Thousand Years (J. C. Schofield), 836
Fluid Mechanics and Heat Transfer : An Introduction to—with Applications in Chemical and Mechanical Process Engineering (Prof. J. M. Kay), *review* by R. W. Haywood, 66
Fluid Phase of Serum Agar Cultures of Bone Marrow Flecks : Effect of Amethopterin and 6-Mercaptopurine on the Pattern of Oxygen Tension Measurements in the (Dr. H. J. Woodliff and J. M. G. Davis), 477
Fluids (Biological) : Proteins of the (St. Jans Hospital, Bruges, Colloquium on), 14
Fluorescence Studies of Chloroplast Development in *Euglena* (Dr. H. T. Epstein, E. Boy de la Tour and Dr. Jerome S. Schiff), 825
Fluorescence (Delayed), in Phenanthrene Vapour : Spectrum of—a Criterion of Purity (Dr. B Stevens, E. Hutton and Prof G. Porter), 917
Fluorescence and Fluorescent Compounds (Department of Chemical Technology of Bradford Institute of Technology Symposium on), 893
Fluorescent Compounds : Fluorescence and (Department of Chemical Technology of Bradford Institute of Technology Symposium on), 893
Fluorescent Wave-lengths (Activating and), of Furocoumarins : Psoralens (Dr. M. A. Pathak and Prof J H. Fellman), 382
Fluorine Cyanide : Microwave Spectrum of (Dr. J Sheridan, J. K. Tyler, Dr. E. E. Aynsley, R. E. Dodd and R. Little), 96
α-Fluoroaconitate : Triethyl (Ernst D. Bergmann and I Shahak), 529
Fluxes (Salicylate and Potassium), of Rat Diaphragm (Dr. J. A. Hicklin), *errata*, 215
Fly Ash : Weathering of (L. H. Jones and A. V. Lewis), 404
Foetal Haematopoietic Tissues : *In vitro* Synthesis of Foetal and Adult Haemoglobin by (Dr. E. Donnall Thomas, Harry L. Lochte, jun., William B Greenough, III, and Marion Wales), 396
Foetal Hypophysectomy : Effect of, on the Foetal Liver Fat in the Rabbit (Dr. J. G. Bearn), 849
Foetal Liver Fat in the Rabbit : Effect of Foetal Hypophysectomy on the (Dr J G Bearn), 849
Foetal and Adult Haemoglobin : *In vitro* Synthesis of, by Foetal Haematopoietic Tissues (Dr. E. Donnall Thomas, Harry L Lochte, jun., William B. Greenough, III, and Marion Wales), 396
Fogg, Dr. G. E. : New Delhi Symposium on Algae, 820
Algology (Extracellular Products of Algae), 820 , (Nitrogen Fixation), 820
Folkes, Dr. B. F. (Hepden, P. M., and) : A Possible Relationship between Nucleic Acid Metabolism and the Initiation of Zygospores of *Rhizopus sexualis*, 254

Folds and Faults on Rock Surfaces beneath the Sea : Recognition of (A. H. Stride), 837
Follicles (Wool) Formation of New, in the Adult Sheep (A. H Brook, B. F. Short and A. G. Lyne), 51
Fontanelles (Dorsal), in Selachian Neurocrania (S. A. R. Hamdy), 939
Food : Release of Iron from Conjugates in (Rona Sanford), 533
  Science and (British Food Manufacturing Industries Research Association Conference on), 737
Food Cycles (Plant–Animal), in the Sea (J. H. Steele), 218
Food Investigation . Progress in (Dr. Francis Aylward), 819
Food Investigation 1958—Report of the Food Investigation Board with the Reports of the Low Temperature Research Station and the Ditton Laboratory (Department of Scientific and Industrial Research), 819
Food Investigation Board : Report for 1958, with the Reports of the Low Temperature Research Station and the Ditton Laboratory (Department of Scientific and Industrial Research), 819
Food Manufacturing Industries Research Association (British) : Conference on Science and Food, 737
Food Restriction and Salt Preference in Rats (Hans Kaunitz, Lester M. Geller, Charles A. Slanetz and Ruth E. Johnson), 350
Food Storage : Use of Toxic Chemicals in Agriculture and (Appointment by the Minister of Agriculture, Fisheries and Food, with the Minister for Science, the Secretary of State for Scotland and the Minister of Health of a Research Study Group to consider the), 578
Food and Agriculture Organization (United Nations) : Appointment of Dr. A. W. Meschkat as regional fisheries officer for Africa, 356
Food and Agriculture Organization and the World Health Organization (United Nations) : Symposium on Education and Training in Nutrition in Europe, 585
Ford, I A. M., and Thompson, S. A. M : Thiol Exchange System with Thiolbenzoic Acid, 96
Ford Foundation : Grant of 500,000 dollars to the European Organization for Nuclear Research, 146
Forecasting the Annual Yield in Sea Fisheries (Prof. Per Ottestad), 183
Foreign Policy . United States—Possible Nonmilitary Scientific Developments and their Potential Impact on Foreign Policy Problems of the United States (A Study prepared at the request of the Committee on Foreign Relations of the United States Senate, by Stanford Research Institute), 561
Foreign Policy in the United States : Science and (Eugene Staley and Guy Benveniste), 584
Foreign Relations (Committee on), of the United States Senate : United States Foreign Policy—Possible Nonmilitary Scientific Developments and their Potential Impact on Foreign Policy Problems of the United States (A Study prepared by Stanford Research Institute), 561
  Science and Foreign Policy in the United States (Eugene Staley and Guy Benveniste), 584
Forensic Science Society . Appointment of S S. Kind as editor of the *Journal*, 815
Forerunners of Darwin, 1745-1859 (edited by Bentley Glass, Oswei Temkin and William L. Straus, Jr.), *review* by Sir Gavin de Beer, 2
Forest Products Research Laboratory : Re-statement of policy of the Council for Scientific and Industrial Research for the, 75
  Retirement of Dr. F. Y. Henderson from the directorship, 212
  Appointment of H. Wooldridge as director, 212
Forestry Commission : Grant of £4,000 to the University of Oxford, for the continuation of an investigation into the costs of private forestry and economic information concerning private forestry estates in England and Wales, 506
  Small Pulp Mill Survey, United Kingdom—Economic Study (Sandwell and Co., Ltd.), 894
  Board Mill Survey, United Kingdom—Economic Study (Sandwell and Co., Ltd.), 894
Forestry Commission Research Station, 281
Forestry Commission (British Trust for Ornithology and the) : Conference on Birds and Forests, 731
Forestry and Soils (Welsh Soils Discussion Group Meeting on), 215
Forests : Birds and (British Trust for Ornithology and the Forestry Commission Conference on), 731
Formaldehyde-induced Mutagenesis : Significance of Ribonucleic Acid in the Mechanism of (Dr. Thomas Alderson), 904
Formation of Carotene *in vitro* (H. Yokoyama, Prof. C. O Chichester and Prof G. Mackinney), 687
Formation of New Wool Follicles in the Adult Sheep (A H. Brook, B. F. Short and A G. Lyne), 51
Formation of I- and III-Type Porphyrins by the Polymerization of Pyrroles (E. Bullock, Prof. A. W. Johnson, E. Markham and K. B. Shaw), 607
Formation of Volatile Compounds on Gas–Liquid Chromatography Columns (Margaret E Kieser and D. J Sissons), 529
Formation of L-Xylosone from Ascorbic Acid (Dr. G C Whiting and R. A. Coggins), 843
Formation (Alleged), of an Intermediate Diamond Structure on Heating Diamond (Dr F. A. Raal), 523
Formation (Antibody), by 6-Mercaptopurine : Inhibition of the Inductive Phase of, examined by the Transfer of Isolated Cells (Dr. J. Sterzl), 256
Formation (Ball Lightning) A Theory of (Prof. W. K. R. Watson), 449
Formation (Cavity), in Simple Pipes due to Rupture of the Water Column (B. B Sharp), 302
Formation (Methylglyoxal), from Aminoacetone by Ox Plasma (Dr. W. H. Elliott), 467
Formation (Root) · Gravimorphism and (Dr J K. A. Bleasdale), 544
Formation (Sperm), and Epididymal Passage in the Bull : Influence of Ejaculation Frequency on the Time required for (Dr. H. H. Koefoed-Johnsen), 49
Formation and Breakdown of Haemoglobin (Association of Clinical Biochemists and the Biochemical Society Symposium on), 737
Formations (Cave) : Radiocarbon Measurements and Annual Rings in (Prof. Wallace S Broecker, Dr. Edwin A. Olson and Dr. Phil C. Orr), 93
Forster, Michael · An Audit of Academic Performance—a Study of the Prediction of Academic Success in the Queen's University of Belfast, 218
Fossilized Human Remains from Northern Kenya (Dr. T. Whitworth), 947
Fossils, Minerals and Rocks : Collecting (British Museum (Natural History), Instructions for Collectors, No. 11), seventh edition, 432
Foster, W. W. : Aerodynamic Capture of Particles, 665
Foth, Prof H. D., and others : Fundamentals of Soil Science, third edition, *review* by Dr R. M. S. Perrin, 2
Founder's Medal of the Royal Geographical Society awarded to Phillip G. Law, 735
Foundry Sands (Borough Polytechnic, London, Course of Lectures on), 286
Four Thousand Years : Sea-Level Fluctuations during the Past (J. C. Schofield), 836
Fourah Bay College : University College of Sierra Leone (Dr F. J. Taylor and Dr. E Downing), 884
Fowl (Domestic) : Experimentally Induced Proliferation of the Rudimentary Gonad of an Intact (Prof. W. Kornfeld), 320
Fowl Leucocytes (Adult) · Chorioallantoic Membrane Lesions produced by Inoculation of (Dr Georgiana Boyer), 327
Fraction (Microsome), of Plant Cells : Occurrence of an Organ-Specific Antigen associated with the, and its Possible Significance in the Process of Cellular Differentiation (Dr. S T C. Wright), 82
Fractions (*Mycobacterium* Cell), *in vivo* · Effect of Streptomycin on the Incorporation of Tyrosine labelled with Carbon-14 into Protein of (Dr. T Erdos and Dr. Agnes Ullmann), 100
Fracture of Metals : Interstitials and (Dr T E Scott and Dr. A R Troiano), 372
Fracture Healing by Vitamin K (J. H. Bouckaert and A. H. Said), 849
Fractured Poly(methyl methacrylate) Surface Characteristics of (Dr. James P. Berry), 91
Fragaria vesca L. var *semperflorens* Duch. Vitamin E and Flowering of (C. Sironval and J. El Tannir-Lomba), 855
Frampton, Dr. Vernon L. (Boudreaux, Prof H Bruce, and) : A Peanut Factor for Haemostasis in Haemophilia, 469
France Direction of Scientific and Technical Research in, 896
Frankland, Dr. B., and Wareing, Prof. P. F. . Effect of Gibberellic Acid on Hypocotyl Growth of Lettuce Seedlings, 255
Fraxinus excelsior L. : Interaction of Growth Inhibitor and a Natural Germination Stimulator in the Dormancy of (T. A. Villiers and Prof. P. F. Wareing), 112
Frazer, Dr R A : *Obituary* by Dr. W P. Jones, 143
Free Amino-acids of some Fungi (R. Close), 609
Free Diffusion of Proteins : The Nuclear Membrane as a Barrier to the (Carl M. Feldherr and Ailene B. Feldherr), 250
Free Radicals . A Proposal for the Nomenclature of (F. P. Lossing and Prof. C. A. McDowell), 161
Freedom (Academic), and University Standards, 795
Freedom (Science and), Committee on · Bulletin No. 13, The Scholar and Society—Report of a Study Group held in Tunis 1959, 273
Freeman, T W. : The Conurbations of Great Britain, *review* by Prof R. E. Dickinson, 877
Freezing : Decrease in Coenzyme I Content of Spleen after (Mollie Luscombe), 691
French Science News, 896
Frequency of an Ammonia Maser in England and Australia : Measurements of the (A M J Mitchell and E. Sandbach), 833
Frequency of Genotypes determining Incompatibility in *Prunus avium* : Effect of Selection on the (Watkin Williams and J. S. Gale), 944
Frequency (Audio-) Electromagnetic Radiation : Correlation of, with Auroral Zone Micropulsations (Dr. J. Aarons, G. Gustafsson and A Egeland), 148
Frequency (Ejaculation) : Influence of, on the Time required for Sperm Formation and Epididymal Passage in the Bull (Dr. H. H. Koefoed-Johnsen), 49
Frequency (Ultra-High) Signal Traversing an Auroral Disturbance : Observed Characteristics of an (J. C James, L. E. Bird, R. P. Ingalls, M. L. Stone, J. W. B. Day, G. E. K. Lockwood and R. I. Presnell), 510
Fresh Plants : Antithyroidal Effects of some, on Guinea Pigs (Dr. P. Langer), 174
Freshwater Life of the British Isles (John Clegg), second edition, *review* by Dr W. J Rees, 801
Freyre, Rubén H. (Irvine, James E., and) : Reversal of Genetic Dwarfism in *Tephrosia vogelii* by Gibberellin, 115
Friction Effect (A Sidewall), during Soil Consolidation (Dr. Carl B Crawford), 371
Fried, Joan F. (Schubert, Jack, and) : Chelating Agents in the Treatment of Poisoning by Polymerizable Radioelements, 551
Friedmann, Christina, and others : Radioactive Fission Products in Lungs, 192
Friend, J (Mayer, A M., and) · Properties and Solubility of Phenolase *in* Isolated Chloroplasts, 464
Fringe (Moiré) : Spiral Growth of Colloidal Gold and (Prof E. Suito and N Uyeda), 453
Frog Melanocytes : Action of Thyroxine Analogues on (Dr. M. Ruth Wright and Dr. Aaron B. Lerner), 169
Frog Sartorius Fibres (Isolated), at Low External Potassium Concentrations : Resting Potentials in (Dr Roderick P Kernan), 471
Frost-Hardiness in Plants : Relation of Sugar Content to (Dr. Akira Sakai), 698
Fruit (Stone-) Viruses (R. S Willison, M. Weintraub and J. H. Tremaine), 660
Fruit and Cider Institute (National), Long Ashton, Bristol : Report for 1958, 743
Fuchs, Sir Vivian · Awarded to Prestwich Medal of the *Geological Society* of London, 657
Fudenberg, Hugh, and others · Distribution of Gm^a [redacted]-like among Javanese, Djuka Negroes, and Oyana and Carib Indians, 324
Fuel, Institute of : Symposium on the Uses of Liquified Petroleum Gases, 580
Fuel Element Technology . Reactor (Imperial College of Science and Technology Course of Lectures on), 215
Fujita, Dr. S. : Mitotic Pattern and Histogenesis of the Central Nervous System, 702
Fuller, Dr. A. S., and Zacharov, J. M. : Abnormalities in the Urinogenital System of the Common Dogfish, 50
Fulton, Dr. J. D. · Host Influence on Parasite Physiology, 897
Function (Adrenocortical), after Prolonged Salt Restriction in Hypertension (Dr. Lewis K. Dahl, Dr. Lawrence Silver, Dr. Robert W. Christie and Dr. Jacques Genest), 110
Function (Possible), of Planktonic Photophores (John S. Colman), 112
Function (Respiratory), of the Swimbladder of *Notopterus* (Lacepede), (Padmaker V. Dehadrai), 929

Function (Testicular) · Relation of Leydig Cells in the Human Testicle to the Tubules and (J. B. W. Halley), 865
Function, including Motility, of Cytoplasmic Membranes : Ionic Exchange and the Structure and (Dr. W. E. Hutton), 439
Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* in Terms in Directional Sensitivity (Prof O. Lowenstein and J Wersall), *errata*, 76
Functional Pituitary Transplants in Rats (Dr. P. N. Martinovitch and D. Pavić), 155
Fundamental Research : Promotion of, 715
Fundamentals of Soil Science (Prof C. E. Millar, L. M. Turk and Prof. H. D. Foth), third edition, *review* by Dr. R M. S Perrin, 2
Funds for Research and Development in the United States (United States National Science Foundation), 813
Funds (Federal), for Science, 1958, 1959 and 1960 (United States National Science Foundation), 813
Fungal Diseases of Animals (Dr. G C. Ainsworth and P. K. C Austwick), *review* by J. E. Smith, 720
Fungi : Free Amino-acids of some (R. Close), 609
Fungi (Nematophagous) : Induction of Traps of, using *Panagrellus redivivus* (Dr Armen C. Tarjan), 779
Fungi (Wilt Disease) : Infection of Peas by (Shirley Hepple (Mrs D. L. Lee)), 333
Fungicides in Agriculture and Horticulture (Pesticides Group of the Society of Chemical Industry Symposium on), 507
Fungitoxicity of Metal Ions (Dr. Lawrence P. Miller), 545
Funt, B. L., and Williams, F. D.: At the Ninth Canadian High Polymer Forum (Retardation and Inhibition of Methyl Methacrylate Polymerization), 358
Furocoumarins (Psoralens) · Activating and Fluorescent Wave-lengths of (Dr. M. A Pathak and Prof J. H Fellman), 382
Furth, Dr. R. . Electron–Phonon Interactions in Solids, 587
Fussell, Dr. M H. : Collection of Urine and Faeces from the Chicken, 332
Future of Non-Ferrous Mining in Great Britain and Ireland—Proceedings of a Symposium arranged by the Institution of Mining and Metallurgy in collaboration with the United Kingdom Metal Mining Association, 1958, *review* by Prof. K. C. Dunham, 801

GABOR, Prof. D., and Jones, Dr. D. : Awarded a grant of £3,000 from the Paul Instrument Fund, for the development of an electron interference microscope, 504
Gadebusch, Dr. H. H. : Infra-Red Spectra of Capsular Polysaccharides from Thirteen Strains of *Cryptococcus neoformans*, 610
Gadkary, D. A. · Mechanical Cultivation in India, *review* by Colin Clark, 414
Gadus callarius L. (Cod) Muscle · Water Content of (R. M Love), 692
Gaffney, Dr. T., and others : Biosynthesis of Lombricine, 383
Galactic Research : Co-ordination of (International Astronomical Union, Symposium No. 7, Stockholm 1957), (edited by A. Blaauw, G. Larsson-Leander, N G. Roman, A. Sandage, H. F. Weaver and A. D. Thackeray), *review*, 801
β-Galactosidase in *Escherichia coli* : Role of the Inducer in the Induced Synthesis of (Prof. H. V. Rickenberg), 240
Galbraith, I. C. J. : Tropical Marine Molluscs from America, *review*, 275
Gale, Dr. E. F. . Microbial Variation and Russian Experiments, *review*, 344
Gale, J. S. (Williams, Watkin, and) : Effect of Selection on the Frequency of Genotypes determining Incompatibility of *Prunus avium*, 944
Galileo Galilei : Discorsi e Dimostrazioni Mathematiche intorno a due Nuove Scienze (a cura di Adriano Carugo e Ludovico Geymonat), *review* by L. Roth, 717
Galileo and Euler as Popular Expositors, *review* by L. Roth, 717
Gall-Bladder of Rabbits : Effect of Injection of a Hepatotoxin directly into the (Dr. N. A. Worker), 785
Gallium Arsenide Tunnel Diodes (K. G. Hambleton, J. J. Low and R. J. Sherwell), 676
Galun, Rachel : Respiration of Decapitated Mosquitoes, 391
Galwey, Dr. A. K. : Appointed a lecturer in physical chemistry at the Queen's University, Belfast, 14
Game Research Association : Formation of the, 889
Game Research Station (Imperial Chemical Industries), Fordingbridge : Work of the, 889
Gametes in Wheat : Differential Transmission of (N. H. Luig), 636
Gametophyte (Embryo-) Complex of *Pinus nigra* var. *austriaca* : Differentiation induced as Season Advances in the, using Indole Acetic Acid (Prof. Norman W. Radforth and Dr. J. M. Bonga), 332
γ-Aminobutyric Acid Levels in Slices of Brain Cortex : Effect of Cations on (Dr. R Rybová), 542
γ-Aminobutyrylcholine : Inhibitory Actions of (M. Asano, T. Noro and K. Kuriaki), 848
γ-Globulin (Human) : A Starch Gel Immunoelectrophoretic Analysis of, demonstrating the Inter- and Intra-Specific Variation of Organisms (Dr. Morris Goodman), 474
γ-Globulin Preparations (Human) : Changes in (F. Skvařil), 475
γ-Irradiated, Substituted Toluenes : Electron Spin Resonance of (N. K. Bridge), 30
γ-[redacted] (Local) : Increases in the, due to Nuclear Bomb Fall-out (J. Venn[redacted]t), 722
γ-Ray Optics · Developments in (Prof. P. B. Moon), 427
γ-Rays : Incorporation of Tritium-labelled Thymidine and Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid after Irradiation of the Deoxyribonucleic Acid Primer with (Dr. S. Okada), 193
Ganapathi, S. V : Algology (Indian Freshwater Phytoplankton in relation to Fisheries and Water Supply), 821
Gandy, Doreen G : 'Watery Stipe' of Cultivated Mushrooms, 482
Ganesan, S. : Thermal Expansion of Triglycine Sulphate, 757
Ganglioside (Brain) · Demonstration of Serum Precipitin to (Dr. Samuel Bogoch), 392
Garcia, Dr. John, and Kimeldorf, Dr. Donald J : Conditioned Avoidance Behaviour induced by Low-Dose Neutron Exposure, 261
Gardell, Prof. Sven, and others : Excretion of Rose Bengal in Bile, 847
Gardener, M., and others : Momentum Spectrum of Cosmic Rays at Sea-Level, 364
Gardner, Capt. Guy : *Obituary* by Dr. G Caton Thompson, 655
Garlick, Dr. G. F. J. . Dielectric Devices (Physical Mechanisms of Photoconductivity and Luminescence), 360
Garnets : Oriented Quartz Inclusions in (A. L. Harris and Dr. N. Rast), 448
Garnett, P. H . Growth of Iron Bacteria in Crude Tar, 942
Garrett, Dr. Margaret (Modell, Dr Walter, and) : Interactions between Pharmacodynamic and Placebo Effects in Drug Evaluations in Man, 538
Garrett, Dr. S. D. : Ecology of Parasites (Inoculum Potential), 290
Garstang, Dr. R. H. . Descriptive Astronomy, *review*, 130
Gas (Interplanetary) : Erosion of Meteorites in Space and the Density of (Dr. L. Reiffel), 821
Gas (Natural) : Geochemical Methods of Prospecting and Exploration for Petroleum and (A. A. Kartsev, Z. A Tabasaranskii, M. I. Subbota and G A. Mogilevskii), English translation edited by Paul A. Witherspoon and William D. Romey), *review* by Dr. John S. Tooms, 876
Gas Chromatography : Purification of Metals by (Dr. F. E. DeBoer), 915
  Separation Factors in (W A. Wiseman), 841
Gas Chromatography of Pyrolytic Products : Identification of the Structure of Non-volatile Organic Substances by (Dr. Jaroslav Janák), 684
Gas Chromatography (Liquid–) : Separation of the Hypnotic Potentiating Principles from the Essential Oil of *Acorus calamus* L. of Indian Origin by (Ross M Baxter, P. C. Dandiya, S I Kandel, A. Okany and Prof. G. C. Walker), 466
Gas Council : Research into Coal Gasification, 431
  Research into the Gasification of Oil, 431
  Research into Problems of Gas Purification and the Treatment of By-products, 431
Gas Discharge High-Vacuum Pump : Pumping Effect of a (Libor Páty), 673
Gas–Liquid Chromatography : Effect of Flow-Rate and Sample-Size on Column Efficiency in (Prof. Richard A. Bernhard), 311
Gas–Liquid Chromatography Columns : Formation of Volatile Compounds on (Margaret E. Kieser and D. J. Sissons), 529
Gases (Activated) : Sorption of, by Titanium Films (L Holland), 911
Gases (Liquified Petroleum) Uses of (Institute of Fuel Symposium on), 580
Gases (Permanent) Self-quenching Geiger Counters containing Mixtures of (A. J. L. Collinson, I. C. Demetsopoullos, J A Dennis and J. M. Zarzycki), 369
Gasić, G., and others : Cementing Substances in Metastasizing and Non-Metastasizing Transplantable Tumours in Mice, 864
Gasification of Coal and Oil, 431
Gaskell, Dr. T F. : Geophysics for the Engineer, *review*, 200
Gasparski, J (Czaja, Prof. M., and) : Some Red-Cell Antigens of *Bison bonasus* as compared to Red-Cell Antigens of Domestic Cattle, 184
Gassiot Research Fellowships in Geomagnetism and Seismology (Meteorological Office), 892
Gastropod : A Bivalve (Dr. L. R Cox and Dr. W. J Rees), 749
Gatenby, Prof. J Bronte, and Mathur, R. S : Position of the Proximal Centriole in Flagellate Spermatozoa, 861
Gatt, Dr. S , and Shapiro, Dr. B : Metabolism of 1-^{14}C Lignoceric Acid in the Rat, 461
Gazopoulos, Prof. J , and others : New Approach to the Synthesis of O-Phosphoserine and related Peptides, 606
Geddes of Epsom, Lord : Appointed a member of the Commonwealth Scholarship Committee in the United Kingdom, 505
Geier, P. W . Physiological Age of Codling Moth Females (*Cydia pomonella* L) caught in Bait and Light Traps, 709
Geiger Counters (Self-quenching), containing Mixtures of Permanent Gases (A. J. L. Collinson, I. C. Demetsopoullos, J. A Dennis and J. M. Zarzycki), 369
Geill, Dr. Torben, and others · Dietary Fats and Thrombosis, 330
Geissman, Prof T. . Principles of Organic Chemistry, *review* by Dr. C. B. Reese, 131
Gel : An Elastin (Dr. Norman H. Grant and Dr. Kenneth C. Robbins) 320
Gel Plates : Quantitative Immuno-Analysis in (Dr J. G. Feinberg), 555
Gel Precipitation : Glacial Acetic and Picric Acids as a Fixation for (Dr. Bengt Bergrahm), 242
Gel (A Starch) Immunoelectrophoretic Analysis of Human γ-Globulin demonstrating the Inter- and Intra-Specific Variation of Organisms (Dr. Morris Goodman), 474
Gelatine and Glue Research Association, British : Eighteenth Meeting of the Research Panel, 587
Gelatins : Ester-like Groups in Different Collagens and (Dr. Jake Bello), 241
Geller, Lester M., and others : Food Restriction and Salt Preference in Rats, 350
Gels (Hydrophilic), for Biological Use (Prof O. Wichterle and D. Lim), 117
Gemmell, Prof A. R. : History of Biology, *review*, 492
General Electric Co., Ltd : Parametric Amplifier Diode 'EW97/1', 355
General Post Office · Engineering-Apprenticeship Scheme, 146
General Reader · Evolution for the, *review* by T H. Hawkins, 65
General Register Office : Registrar General's Statistical Review of England and Wales for the Year 1955, Supplement on Hospital In-Patient Statistics, 214
Generation of Temperatures below 1° K (Low-Temperature Group of the Physical Society Symposium on), 349
Genest, Dr. Jacques, and others : Adrenocortical Function after Prolonged Salt Restriction in Hypertension, 110
Genetic Control of Protein Synthesis in Cell-free Extracts of *Neurospora crassa* : Mediation of the (S. D. Wainwright), 314
Genetic Dwarfism in *Tephrosia vogelii* · Reversal of, by Gibberellin (James E. Irvine and Rubén H. Freyre), 115
Genetically Similar Chromosomes : The Secondary Pairing of Bivalents with (Dr. Ralph Riley), 751
Genetics · The Application of, to Cotton Improvements (Sir Joseph Hutchinson), *review* by Prof S. C. Harland, 494
  Cotton and, *review* by Prof S C Harland, 494
  Human Biochemical (Dr. H. Harris), *review* by Dr. P. H. A. Sneath, 493
Genetics (Human) : Biochemistry of, *review* by Dr. P. H. A. Sneath, 493
Genitalia (Male), of *Apis* Species (J. Simpson), 56
Genkel, P. A. · Water Relationships of Plants in Arid and Semi-Arid Conditions (Reactions of Plants to Water and to Heat), 436
Genotypes determining Incompatibility in *Prunus avium* . Effect of Selection on the Frequency of (Watkin Williams and J S. Gale), 944
Gentili, Bruno (Horowitz, Robert M , and) : Flavonoids of the Ponderosa Lemon, 319

Geochemical Methods of Prospecting and Exploration for Petroleum and Natural Gas (A. A. Kartsev, Z. A. Tabasaranskii, M. I. Subbota and G. A. Mogilevskii), English translation edited by Paul A. Witherspoon and William D Romey, *review* by Dr John S. Tooms, 876
Geographers : Meteorology for, *review* by G. A Bull, 720
Geographical Society (American) : David Livingstone Centenary Medal awarded to William E. Rudolph, 12
  Cullum Geographical Medal awarded to Dr. Albert P. Crary, 12
  Daly Medal awarded to Dr Richard Hartshorne, 12
Geographical Society, Royal . Patron's Medal awarded to Prof Théodore Moned, 735
  Founder's Medal awarded to Phillip G. Law, 735
  Victoria Medals awarded to Dr. Armando Cortesao and Prof. J. A. Steers, 735
  Murchison Grant awarded to Prof. J Wreford Watson, 735
  Back Grant awarded to A. T. Grove, 735
  Cuthbert Peek Grant awarded to G. F. Reif, 735
  Gill Memorial awarded to Joyce M. Lambert, 735
  Mrs. Patrick Ness Award awarded to R. J. Adie, 735
Geography of Ghana (E. A. Boateng), *review* by Prof. L. Dudley Stamp, 567
Geological Implications of Recent Geophysical Work in the British Isles (Geological Society of London Symposium on), 76, 739
Geological Society (Liverpool) : Medal of the Society presented to Dr. J. C. Harper, 14
  Centenary Celebrations, 213
Geological Society of London : Symposium on Geological Implications of Recent Geophysical Work in the British Isles, 76, 739
  Wollaston Medal awarded to Prof. C. E. Tilley, 657
  Murchison Medal awarded to Dr. A. G. MacGregor, 657
  Lyell Medal awarded to Dr. Doris Reynolds, 657
  Prestwich Medal awarded to Sir Vivian Fuchs, 657
  Wollaston Fund awarded to M. A. Calver, 657
  Murchison Fund awarded to Dr. D V. Ager, 657
  Lyell Fund (a moiety of the) awarded to Dr J. D. Lawson and one to Dr. R. H. Cummings, 657
Geological Survey of Great Britain and the Museum of Practical Geology : Retirement of Sir William Pugh from the directorship, 284
  Appointment of Dr. Cyril J Stubblefield as director, 284
  Summary of Progress for 1958, 659
Geology : Petroleum, *review* by Dr John S. Tooms, 876
Geomagnetism and Seismology : Gassiot Research Fellowships in (Meteorological Office), 892
Geometry of the Structure of Monatomic Liquids (Prof J. D. Bernal), 68
Geophysical Surveys in Mining, Hydrological and Engineering Projects, 1958, *review* by Dr. T F. Gaskell, 200
Geophysical Union (American), of the United States National Academy of Sciences : Formation of a Planning Committee on Planetary Sciences, 658
Geophysical Work in the British Isles . Geological Implications of Recent (Geological Society of London Symposium on), 76, 739
Geophysicists (Exploration), European Association of . Geophysical Surveys in Mining, Hydrological and Engineering Projects, 1958, *review* by Dr T. F. Gaskell, 200
Geophysics for the Engineer, *review* by Dr. T F. Gaskell, 200
Geophysics (Mining) : Nordic Meeting for (Svend Saxov), 436
Gerber, Georg B., and others : Some Interrelated Aspects of Proline and Hydroxyproline Metabolism, 767
Gerber, Gisela, and others : Some Interrelated Aspects of Proline and Hydroxyproline Metabolism, 767
Gerhardt, Prof. Philipp, and others : Permeability of Dormant Bacterial Spores, 782
Germ-Cells in *Xenopus laevis* : Transfer of (Dr. Antonie W. Blackler), 859
German Federal Republic : Research in the, 579
Germany (quarterly journal published by the German Embassy in London), Vol 4, No. 12, 579
Germination : Abnormal Growth and Development in Pea resulting from Exposure to Adverse Conditions during (Alex. M M. Berrie), 626
Germination Stimulator (Natural), in the Dormancy of *Fraxinus excelsior* L. : Interaction of Growth Inhibitor and a (T. A. Villiers and Prof P F. Wareing), 112
Geymonat, Ludovico (a cura di Adriano Carugo e) : Discorsi e Dimostrazioni Matematiche intorno a due Nuove Scienze (Galileo Galilei), *review* by L. Roth, 717
Ghana . A Geography of (E. A. Boateng), *review* by Prof. L. Dudley Stamp, 567
Ghosh, Dr. J. J. (Chatterjee, Dr. A. N., and) : Carbon Dioxide Assimilation by *Leishmania donovani*, 322
Ghosts (Human Erythrocyte) : Retention of Potassium by (Dr. J. F. Hoffman, Dr. D. C. Tosteson and Dr. R. Whittam), 186
Giant Deciduous Hominid Tooth from Olduvai An Alternative Interpretation of the Supposed (Dr. J. T. Robinson), 407 ; (Dr. L. S. B. Leakey), 408
Gibb, Dr. J. A : Birds and Forests (Work of the Breckland Research Unit of the Edward Grey Institute), 731
Gibberellic Acid : Commercial Application of, to Hops (A. S. Nash and P. D. Mullaney), 25
  Effect of, on Flower Differentiation in Petkus Winter Rye (O. H. Caso, H. R. Highkin and D Koller), 477
  Effect of, on Hypocotyl Growth of Lettuce Seedlings (Dr. B. Frankland and Prof. P. F Wareing), 255
  Effect of, on Seeded Grapes (S. Lavee), 395
  Effects of, on Excised Pea Roots (Dr. R. C. Pecket), 114
Gibberellic Acid, Indoleacetic Acid and Maleic Hydrazide (Kinetin,) : Certain Mitotic Effects of, on the Root of *Allium cepa* (M. Annunciata McManus), 44
Gibberellin : Effect of, on the Flower Initiation and Stem Extension in Petkus Winter Rye (Dr. O. N. Purvis), 479
  Influence of Hydrogen Ion Concentration and Autoclaving on (Dr. James H. M. Henderson), 628
  Reversal of Genetic Dwarfism in *Tephrosia vogelii* by (James E. Irvine and Rubén H. Freyre), 115
Gibbons, P. E., and Northrop, D. C. : Dielectric Devices (Experiments on the Long-lived Decay Components of Anthracene Scintillations), 360
Gibson, Dr. W. M. : Appointed senior lecturer in physics at the University of Bristol, 736
Giffin, C. E., and others : Potassium–Argon and Rubidium–Strontium Ages of some Granites from Britain and Eire, 495
Gilbert, C., and others : Influence of Insulin on the Incorporation of 2-^{14}C-Sodium Pyruvate into Glyceride Glycerol in Diabetic and Normal Baboons, 168
Gilbo, C. M. (Marr, A. G. M., and) : Serum Chromatography on Columns connected to a Common Source of Buffer Gradients, 853
Giletti, Dr. B. J., and others : Potassium–Argon and Rubidium–Strontium Ages of some Granites from Britain and Eire, 495
Gill, E. W. B. : *Obituary* by Dr. A. von Engel, 503
Gill Memorial of the Royal Geographical Society awarded to Joyce Lambert, 735
Gilles, Dr. H. M., and others : Glucose-6-Phosphate Dehydrogenase Deficiency Trait in Nigeria, 257
Gillespie, R. . At the Ninth Canadian High Polymer Forum (The Limited Flocculation of a Colloidal System by a Water Soluble Polymer), 359 ; (The Rheology of a Polystyrene Latex thickened with Methylcellulose), 359
Gillespie, Dr. T. : Aerodynamic Capture of Particles (Role of Electric Forces in Collision Processes), 665
Gillman, Prof. J., and others : Influence of Insulin on the Incorporation of 2-^{14}C-Sodium Pyruvate into Glyceride Glycerol in Diabetic and Normal Baboons, 168
Ginsberg, A. P , and others : Evidence for the Existence of a Potassium Rhenium Hydride and its Bearing on the Nature of the (–1)-Oxidation State of Rhenium, 528
Ginsburg, Dr. I., and Ram, M. : Action of Antibodies and Plasmin on Ehrlich Ascites Tumour Cells, 328
Gitlin, Prof. David, and Janeway, Charles A. : Turnover of the Copper and Protein Moieties of Ceruloplasmin, 693
Glacial Acetic and Picric Acids as a Fixation for Gel Precipitation (Dr. Bengt Bergrahm), 242
Glaister, R. M. : Dielectric Devices (Relaxation Polarization Dielectrics), 361
Gland (Rat Pineal) : Histochemical Evidence of Aminopeptidase Activity in (Dr. Mikko Niemi and M. Ikonen), 928
Glass, Bentley, and others (edited by) : Forerunners of Darwin, 1745-1859, *review* by Sir Gavin de Beer, 2
Glazko, A. J., and others : A New Metabolite of Chloramphenicol, 535
Gleadthorpe Experimental Husbandry Farm of the Ministry of Agriculture, Fisheries and Food : Appointment of P. N. Harvey as farm director, 146
Glenner, G. G , and Cohen, L. A. : Histochemical Demonstration of a Species-Specific Trypsin-like Enzyme in Mast Cells, 846
Glick, Prof. David (edited by) : Methods of Biochemical Analysis, Vol. 7, *review* by Dr. D T. Elmore, 797
Global Hydromagnetic Wave Ducts in the Exosphere (H. A. Bomke, W. J. Ramm, S. Goldblatt and V. Klemas), 299
Globerson, Dr. A., and others : Antibodies in Ribonucleoproteins, 317
γ-Globulin (Human) . A Starch Gel Immunoelectrophoretic Analysis of, demonstrating the Inter- and Intra-Specific Variation of Organisms (Dr. Morris Goodman), 474
γ-Globulin Preparations (Human) : Changes in Outdated (F. Skvařil), 475
Globus Pallidus (Human) : Marchi-Positive Bodies in (Dr. Marion C. Smith), 938
Glossina morsitans . Ovaries of (D. S. Saunders), 121
Glover, J H. : Co-opted as secretary of the Polarographic Society, 14
Glover, R. S. : Elected a Fellow of the Royal Society of Edinburgh, 734
Glover, W. E. : Appointed lecturer in physiology at the Queen's University, Belfast, 14
Glucagon, a Protein Catabolic Hormone in the Isolated Perfused Rat Liver (Prof. Leon L. Miller), 248
Glucose-isomerase in Barley Malt (Dr. J. Bártfay), 924
Glucose Metabolism of Chicken Embryo Fibroblasts : Effect of Kinetin on (Dr. S. Halevy and Lydia Avivi), 388
Glucose Metabolism in Human Pancreatic β-Cells : Evidence for the Hexose Monophosphate Pathway for the (Dr James B. Field, Phyllis Johnson, Betty Herring and Arnold N. Weinberg), 468
Glucose-6-Phosphate Dehydrogenase Deficiency Trait in Nigeria (Dr. H M. Gilles, J. Watson-Williams and B. G. Taylor), 257
Glucose-6-Phosphate Dehydrogenase-deficient Subjects (Erythrocyte)—Enzyme-Level in Saliva (Dr. Bracha Ramot, Chaim Sheba, Avinoam Adam and Israel Ashkenasi), 931
Glues and Chemicals, Ltd. (British) : Report on Proteins from Grass, 891
Glyceride Glycerol : Influence of Insulin on the Incorporation of 2-^{14}C-Sodium Pyruvate into, in Diabetic and Normal Baboons (N. Savage, Prof. J. Gillman and C. Gilbert), 168
Glycerides in the Mucosa of the Small Intestine . Biosynthesis of (Dr. B. Clark and Dr. G. Hubscher), 35
Glycerol (Glyceride) : Influence of Insulin on the Incorporation of 2-^{14}C-Sodium Pyruvate into, in Diabetic and Normal Baboons (N. Savage, Prof. J. Gillman and C. Gilbert), 168
Glycerol-extracted Psoas Fibres : Effect of Heavy Water on Different Types of Muscle and on (Dr. Benjamin Kaminer), 172
Glycine-2-^{14}C and Turkey Liver Homogenates : Isolation of Radioactive Vitamin B_{12} from Incubation Mixtures containing (Pran Vohra and F. H. Kratzer), 45
Glycollate : Microbial Oxidation of, via a Dicarboxylic Acid Cycle (Dr. H. L. Kornberg and J. R. Sadler), 153
Glycolysis (Anaerobic), of Dispersed Cell Suspensions from Normal and Malignant Tissues (Dr. M. Zimmerman, T M. Devlin and M. P. Pruss), 315
Glycosides (Cardiac), and Inorganic Ions : Effect of, on Binding of Serotonin by Platelets (Herbert Weissbach, Betty G. Redfield and Elwood Titus), 99
Glycosylation : Effect of, on the Enzymic Oxidation and Translocation of Flavonoids (Dr. E. A. H. Roberts), 536
Gm^a and Gm-like : Distribution of, among Javanese, Djuka Negroes, and Oyana and Carib Indians (Prof. Arthur G. Steinberg, Rachel Stauffer and Hugh Fudenberg), 324
Goat and Sheep : Physiological Mechanisms concerned in the Maintenance of Lactation in the (R. Denamur and J. Martinet), 252
God's Action in a World governed by Scientific Law : Chance and Providence— (Dr. William G. Pollard), *review* by the Rev. Dr. E. L. Mascall, 875

Goddard, Prof. L. S. : Mathematics and Operations Research, *review*, *erratum*, 433
Godet, Dr. R. (Mohsen, Dr. T., and) : Action of Thyroxine on the Rate of Oxygen Consumption of the Lung-Fish (*Protopterus*), 108
Godley, E. J. . The Biology of the Southern Cold Temperate Zone, 205

Henriksen, T., and Pihl, A : Electron Paramagnetic Resonance Observations on Irradiated Thiols and Disulphides, 307
Hens poisoned with Tri*para*ethylphenyl Phosphate : Ataxia in (Ann Silver), 247
Henstock, Dr. R. A : Appointed senior lecturer in pure mathematics at the University of Belfast, 286
Heparin Content of Rat Skin : Effect of Age on the (Dr. Sara Schiller and Dr. Albert Dorfman), 111
Hepatotoxic Activity of Semi-Synthetic Analogues of Pyrrolizidine Alkaloids (Dr. R. Schoental and Dr. A. R. Mattocks), 842
Hepatotoxin : Effect of Injection of a, directly into the Gall-Bladder of Rabbits (Dr. N. A. Worker), 785
Hepatotoxin causing Liver Damage in Facial Eczema of Sheep (Dr. N. A. [redacted]
Hepburn, F. . Constant Ionosphere Height for Audiofrequency Propagation, 599
Hepburn, Dr. R. W. : Appointed to the chair of philosophy in the University of Nottingham, 737
Hepden, P. M., and Folkes, Dr. B. F. : A Possible Relationship between Nucleic Acid Metabolism and the Initiation of Zygospores of *Rhizopus sexualis*, 254
Hepple, Shirley (Mrs. D. L. Lee) : Infection of Peas by Wilt Disease Fungi, 333
Herald Research Reactor at Aldermaston (United Kingdom Atomic Energy Authority), 735
Herbage : Nitrate Content of, at Different Manurial Levels (Dr. G. ap Griffith), 627
Herbicides and the Soil (British Weed Control Council Symposium on), 356
Hereditary Disease of Sheep : Scrapie, a Transmissible (H. B. Parry), 441
Herne, H. : Aerodynamic Capture of Particles, 665
Herpes Simplex Virus : Persistence of, in HeLa Cells (Dr. Carmen Gil Fernandez), 268
Herring, Betty, and others : Evidence for the Hexose Monophosphate Pathway for the Glucose Metabolism in Human Pancreatic β-Cells, 468
Herzfeld, Karl F., and Litovitz, Theodore A : Absorption and Dispersion of Ultrasonic Waves, *review* by Prof E G Richardson, 3
Heterodera major Cysts . Effect of Soil Drying on the Viability of (J. J Duggan), 554
Hetherington, Sir Hector · Appointed a member of the Commonwealth Scholarship Committee in the United Kingdom, 505
Heuvelmans, Dr. Bernard : On the Track of Unknown Animals (translated from the French by Richard Garnett), *review* by R. W. Hayman, 643
Hevea brasiliensis Latex Serum : Co-factors in (A. I. McMullen), 103
Hexose Monophosphate Pathway for the Glucose Metabolism in Human Pancreatic β-Cells : Evidence for the (Dr. James B. Field, Phyllis Johnson, Betty Herring and Arnold N. Weinberg), 468
Hey, E N. (Hey, M. H., and) : Fitting ν Linear Relations to n Variables all Liable to Error, 338
Hey, M H., and Hey, E. N : Fitting ν Linear Relations to n Variables all Liable to Error, 338
Heywood, Rosalind : The Sixth Sense, *review* by Dr. E. J. Dingwall, 646
Heywood, Dr. V H. : Flora Europaea in Vienna, 15 ; (Problems of Geographical Distribution and Taxonomy), 16 ; (Taxonomy of Polyploids in Flora Europaea), 16
Heywood and Co , Ltd. · To publish *Electronics Weekly*, 815
Hibernators : Reaction of, to various Low Temperatures of the Environment (Dr. Zdenek Bartoš), 251
Hicklin, Dr. J A. : Salicylate and Potassium Fluxes of Rat Diaphragm, *errata*, 215
Hickson's Timber Impregnation Co (G.B.), Ltd : Grant of £1,000 to the University of Leeds, to provide a fellowship in the Department of Botany, 892
Hie, Dr. Jo Bwan (Lie-Injo Luan Eng, Dr., and): A Fast-moving Haemoglobin in Hydrops Foetalis, 698
Higgy, Robert C., and others : Observations of Ionization induced by Artificial Earth Satellites, 520
High Atmosphere . Measurement of Solar and Diurnal Effects in the, by Artificial Satellites (H. A. Martin and Dr. W. Priester), 600
High-Atmosphere Research in the Meteorological Office, 814
High-Energy Radiation : Effect of, on Mixtures of Vinyl or related Polymers with Unsaturated Compounds (B. J. Lyons), 604
High-Frequency (Ultra-) Signal Traversing an Auroral Disturbance : Observed Characteristics of an (J C. James, L. E. Bird, R. P. Ingalls, M L. Stone, J. W. B Day, G. E. K. Lockwood and R. I Presnell), 510
High Intakes of Sulphate and Molybdate : Demyelination in Lambs born of Ewes maintained on (C. F. Mills and B. F. Fell), 20
High Mach Number Air-breathing Machines (Combustion and Propulsion Panel of the Advisory Group for Aeronautical Research Development of NATO, Colloquium on), 146
High Molecular Weight Carbohydrates : Physical, Chemical and Biological Methods of Study in (Chemical Society Symposium on), 507
High Polymer Forum : Ninth Canadian (Prof. K. E. Russell), 358
High-Spacing Meridional Reflexions in the X-Ray Photograph of Keratin impregnated with Heavy-Metal Salts : Enhancement of the (W. S. Simpson and H. J. Woods), 157
High Specific Activity Tracer Studies : A Pitfall in (Dr. E. Hell, Dr. R. J Berry and Dr. L. G. Lajtha), 47
High-Speed Photography : International Congress on (Society of Motion Picture and Television Engineers), 14
High-Vacuum Pump (Gas Discharge) : Pumping Effect of a (Libor Páty), 674
High-Yield Nuclear Explosions : Fall-out over Norway from (T. Hvinden, D. Hveding, A. Lillegraven and S. H. Small), 805
Highkin, H. R , and others : Effect of Gibberellic Acid on Flower Differtiation in Petkus Winter Rye, 477
Highland Britain · Upland Climate and Land Usage, with special reference to (Third Symposium on Aspects of Agricultural Meteorology), (University College, Aberystwyth), 737
Highly Organized Structure within a Neurosecretory Vesicle (Sir Francis Knowles), 709
Hill, A. V. : Spore Release in *Peronospora tabacina* Adam., 940
Hill, Sir Francis : Appointed a member of the Commonwealth Scholarship Committee in the United Kingdom, 505
Hilsum, C. (Whitlock, W. S., and) : Measurement of Ion Beam Currents using a Hall Effect Magnetometer, 302
Himsworth, R. L. : Effect of Adrenaline and Insulin upon the Oxygen Consumption of Hyperthyroid Rats, 694
Hinshelwood, Sir Cyril : Appointed a member of the Commonwealth Scholarship Committee in the United Kingdom, 505
Hintenberger, Dr. H. (Voshage, Dr. H., and) : Calculation of Cosmic-Ray Ages in the Iron Meteorites 'Carbo' and 'Treysa', 88
Hirschfeld, Dr. Jan : Shape of the Precipitate in Immunoelectrophoresis, 164, *erratum*, 507
Hirschfeld, Dr Jan, and others : Inheritance of a New Group-Specific System demonstrated in Normal Human Sera by means of an Immuno-Electrophoretic Technique, 931
Hiss (Rare), Earth Currents and Micropulsations on November 27, 1959 (E. M. Wescott, J. H. Pope, D. O. Dyer and Dr. W. H. Campbell), 231
Histamine and 3-Methyl Histamine : Copper (II) Complexes of (Dr. R. Leberman and Dr. B R. Rabin), 768
Histamine Sensitivity in Children after *Pertussis* Infection (Dr. R. K. Sanyal), 537
Histamine (3-Methyl) : Copper (II) Complexes of Histamine and (Dr. R. Leberman and Dr. B R. Rabin), 768
Histochemical Demonstration of a Species-Specific Trypsin-like Enzyme in Mast Cells (G. G. Glenner and L A Cohen), 846
Histochemical Demonstration of Succinic Dehydrogenase Activity in Osteoclasts (Dr M S. Burstone), 866
Histochemical Evidence of Aminopeptidase Activity in Rat Pineal Gland (Dr Mikko Niemi and M Ikonen), 928
Histochemical Localization of Oxidase Activity in the Mitochondria of the Heart in some Lower Vertebrates (Prof. A. Stolk), 866
Histogenesis of the Central Nervous System : Mitotic Pattern and (Dr. S. Fujita), 702
History of Biology to about the Year 1900 (Dr. Charles Singer), third edition, *review* by Prof. A. R. Gemmell, 492

History of Philosophy : Pictorial (Dagovery D. Runes), *review* by Gerd Buchdahl, 67
History of the Royal Society (Thomas Sprat), edited with Critical Apparatus by Jackson I. Cope and Harold Whitmore Jones, *review* by Prof. E. N. da C. Andrade, 343
History of Science, *review* by Dr. William P. D Wightman, 413
History of Science Society : Pfizer Prize awarded to Dr. Marie Boas's Book 'Robert Boyle and Seventeenth Century Chemistry', 660
History of Scientific Ideas to 1900 : A Short (Dr. Charles Singer), *review* by Dr William P. D. Wightman, 413
Histotrophic (Parasitic) Stages of *Haemonchus contortus* (Dr. Paul H. Silverman and J E Patterson), 54
Hobbs, L. M , and others : At the Ninth Canadian High Polymer Forum (The Determination of the Breadth of Molecular Weight Distribution in Polyethylene by an Irradiation Technique), 359
Hobden, M : Generation of Temperatures below 1° K. (Properties of ^{3}He relevant to the Lower Limit of Constant-temperature Baths to nearly 0·3° K), 349
Hocking, Dr. L M. · Aerodynamic Capture of Particles (Calculations on the Relative Motions of Particles of Comparable Size), 665
Hodge, Sir William : Appointed a vice-president of the Royal Society, 74
Hodgetts, V Elizabeth (Turner, Dr. A. W., and) : Fall in Haematocrit in Sheep after Treatment with Chlorpromazine and Dihydroergotamine, 43
Hoff, Prof. Ferdinand · Elected a member of the Internal Medicine Section of the Leopoldina Academy of Sciences, 506
Hoffman, Dr. J. F., and others : Retention of Potassium by Human Erythrocyte Ghosts, 186
Hoffmann, G., and Keppler, J. G. : The Stereo-Configuration of 2,4-Decadienals isolated from Oils containing Linoleic Acid, 310
Hogfeldt, Erik : Ionic Hydration in Mixtures of Strong Acids and Water, 760
Holdgate, Dr. M. W. : The Biology of the Southern Cold Temperate Zone, 204
Holečková, E. (Sekla, Prof. B., and) : Diathelic Immunization of Sheep against a Rat Cancer, 618
Holland, L. : Sorption of Activated Gases by Titanium Films, 911
Hollunger, Dr. Gunnar (Chance, Prof. Britton, and) · Energy-linked Reduction of Mitochondrial Pyridine Nucleotide, 666
Holm, A. : Mining Geophysics (A New Instrument for Measuring the Curvature in Bore-holes), 436
Holme, Dr. T., and others : Antigens of Spheroplast Membrane Preparations from *Escherichia coli* B, 57
Holmes, Dr. R. L., and Knowles, Sir Francis : 'Synaptic Vesicles' in the Neurohypophysis, 710
Holmquist, Stig : Two New Complex Calcium Ferrite Phases, 604
Holt, Dr. P. F. (Clark, S. G., and) : Dissolution of Chrysotile Asbestos in Water, Acid and Alkali, 237
Home Counties (London and), Regional Advisory Council for Technological Education : Bulletin on Courses in Advanced Technology, 506
Homer, Dr. George M., and others : Casein labelled with Iodine-131 as a Substrate for the Measurement of Trypsin and Chymotrypsin, 238
Hominid Tooth (Supposed Giant Deciduous), from Olduvai : An Alternative Interpretation of the (Dr. J. T. Robinson), 407 ; (Dr. L. S. B. Leakey), 408
Homocatechol in an Insect Cuticle (S. R. A. Malek), 56
Homogenates (Human Prostatic), *in vitro* : Inactivation of Acid Phosphatase in—Role of Calcium (Prof. H. J. Tagnon and A. Steens-Lievens), 48
Homogenates (Turkey Liver) : Isolation of Radioactive Vitamin B_{12} from Incubation Mixtures containing Glycine-2-^{14}C and (Pran Vohra and F. H. Kratzer), 45
Honegger, Dr. Conrad G., and Honegger, Ruth : Volatile Amines in Brain, 530
Honegger, Ruth (Honegger, Dr. Conrad G., and) : Volatile Amines in Brain, 530
Honours List : New Year, 74
Hopkins, Dr. H. H. : Awarded a grant of £8,100 from the Paul Instrument Fund, for the development of methods of drawing and coating fine glass fibres, and their alignment in ordered bundles for the transmision of optical images, 504
Hops : Commercial Application of Gibberellic Acid to (A. S. Nash and P. D. Mullaney), 25
Horiguchi, Masaaki, and Kandatsu, Makoto : Isolation of 2-Aminoethane Phosphonic Acid from Rumen Protozoa, *erratum*, 146
Horizontal Drifts in the *E*-Region at Waltair (R. Raghava Rao and Prof. B. Ramachandra Rao), 27
Hormonal Control of Moulting in Amphibians (C. Barker Jørgensen and Lis Olesen Larsen), 244
Hormonal Control of Secretion in the Oviduct of the Amphibia (Patricia D. B. Lodge and Dr. C. L. Smith), 774
Hormone : Response of Inbred and F_1 Hybrid Mice to (Dr. C. K. Chai), 514
Hormone (Aldosterone-stimulating), in Urine : Presence of (Dr. E. J. Ross, E. K. McLean and G. R. Miller), 540
Hormone (Crustacean Moulting) : Attempted Extraction of, from Isolated Y-Organs (Dr. Peter Karlson and Dorothy M. Skinner), 543
Hormone (Luteinizing) : Assaying (Dr. F. A. Soliman), 321
Hormone (Protein Catabolic), in the Isolated Perfused Rat Liver : Glucagon, a (Prof. Leon L. Miller), 248
Hormone (Purified Human Growth) : Immunochemical Observations on Antisera to (Prof Melvin M. Grumbach, Dr. Selna L. Kaplan and Dr. Sheila Solomon), 170
Hormones : The Thyroid (Dr. Rosalind Pitt-Rivers and Jamshed R. Tata), *review* by Prof. F. G. Young, 721
Horne, Dr. M. R. : Appointed professor of civil engineering in the University of Manchester, 212 ; work of, 212
Horner, R. F., and others : Uses of Liquified Petroleum Gases (Composition and Properties of 'L.P.G.'), 580
Horning, Prof. Eric S. : *Obituary* by Dr. F. Bielschowsky, 576
Horowitz, Robert M., and Gentili, Bruno : Flavonoids of the Ponderosa Lemon, 319
Horridge, Dr. G. A. : Pitch Discrimination in Orthoptera (Insecta) demonstrated by Responses of Central Auditory Neurones, 623
Horticultural Co-operative Marketing Societies : Working Party on (To be set up by the Minister of Agriculture, Fisheries and Food), 736
Horticulture : Fungicides in Agriculture and (Pesticides Group of the Society of Chemical Industry Symposium on), 507
Horváth, T. (Turchányi, Gy., and) : Evaporation Figures on the Surface of Sodium Chloride Crystals, 601
Hospital In-Patient Statistics : Registrar General's Statistical Review of England and Wales for the Year 1955—Supplement on (General Register Office), 214
Hospital Library Services, a Pilot Survey (King Edward's Hospital Fund for London), 589
Hospital Morbidity Statistics in Great Britain, 214
Host Influence on Parasite Physiology (Bureau of Biological Research Conference on), 897
Hosts (Snail) : Penetration of *Fasciola gigantica* Cobbold, 1856, into (Dr. Ben Dawes), 51
Hough, Dr. L., and others : Polysaccharide Composition of Leaves, 166
Houghton, D. R., and Millar, H. R : Spread of the Ascidian, *Styela mammiculata* Carlisle, 862
Houldsworth, S. N. : Appointed lecturer in chemical engineering at the Borough Polytechnic, London, 215
House of Commons : Second reading of the Atomic Energy Authority Bill, 127
  Second reading of the Marshall Scholarships Bill, 271
  Second reading of the Commonwealth Scholarships Bill, 271
  Debate on Science in Civil Life, 583
House of Lords : Second reading of the Marshall Scholarships Bill, 271
  Second reading of the Public Health Laboratory Service Bill, 505
  Debate on Science in Civil Life, 583
House-Flies : Sex-limited DDT-Resistance in (R. W Kerr), 868
Houston, Prof. Arthur H. : Variations in the Plasma-Level of Chloride in Hatchery-reared Yearling Atlantic Salmon during Parr–Smolt Transformation and following Transfer into Sea-Water, 632
Houtman, T., and others · At the Ninth Canadian High Polymer Forum (Poly-*N*-vinyl, 5-Methyl 2-Oxazolidone (PVOM), a New Complexing Polymer), 359
Hovercraft : The (J. L. Stollery), 819
Hradec, Dr. J , and Kruml, Dr. J. : 'Carcinolipin', an Endogenous Carcinogenic Substance, 55
Hraessig, H. A , and Neal, J : At the Ninth Canadian High Polymer Forum (The Degradation of Cellulose by Megavolt Electrons), 358
Hryniszak, Dr. W. : Heat Exchangers—Applications to Gas Turbines, *review* by R. W. Haywood, 66
Hu, G. C.-Y. : Appointed lecturer in highway and traffic engineering at the University of Birmingham, 433
Hubbs, Carl L. (edited by) · Zoogeography—a Symposium at the Stanford University Joint Meeting of the American Institute of Biological Sciences and the Pacific Division of the American Association for the Advancement of Science (1957), and a Symposium at the Indianapolis Meeting of the American Association for the Advancement of Science (1957), *review*, 800
Hübscher, Dr. G. (Clark, Dr. B., and) : Biosynthesis of Glycerides in the Mucosa of the Small Intestine, 35
Hudson, Dr. F. Lyth : Important Raw Materials, *review*, 646
Hug, Prof Otto : Radioisotopes in Medical and Biological Research, *review*, 876
Hultqvist, Dr. Bengt, and others : A Day-time Maximum of Oblique Auroral Reflexions observed in the Auroral Zone, 519
Human Adaptation to Cold (Dr. Laurence Irving), 572
Human Amnion Cells infected with Measles Virus : Electron-dense Crystallites in Nuclei of (Richard F. Baker, Prof. Irving Gordon and Fred Rapp), 790
Human Biochemical Genetics (Dr. H. Harris), *review* by Dr. P H. A. Sneath, 493
Human Bone : Determination of Strontium-90 Distribution in (R. Björnerstedt and S. Häggroth), 366
Human Dentin Collagen (Decalcified) : Peptides obtained from Partial Hydrolysis of (Dr. C. C. Solomons), 101
Human Diet in the United Kingdom : Relationship between the Rate of Fall-out and the Concentration of Strontium-90 in (Dr. J. D. Burton, G. M. Milbourn and Dr. R. Scott Russell), 498
Human Enamel (Mineralized) : Preparation of Ultra-Thin Sections of (R. W. Fearnhead), 550
Human Epidermis (Isolated) · Effect of Soap on the Diffusion of Water through (F. Ray Bettley and Elaine Donoghue), 17
Human Erythrocyte Ghosts : Retention of Potassium by (Dr. J. F. Hoffman, Dr. D. C. Tosteson and Dr. R. Whittam), 186
Human Genetics : Biochemistry of, *review* by Dr. P. H. A. Sneath, 493
Human γ-Globulin : A Starch Gel Immuno-electrophoretic Analysis of, demonstrating the Inter- and Intra-Specific Variation of Organisms (Dr. Morris Goodman), 474
Human γ-Globulin Preparations : Changes in Outdated (F. Skvařil), 475
Human Globus Pallidus : Marchi-Positive Bodies in (Dr. Marion C. Smith), 938
Human Growth Hormone (Purified) : Immuno-chemical Observations on Antisera to (Prof. Melvin M. Grumbach, Dr. Selna L. Kaplan and Dr. Sheila Solomon), 170
Human Pancreatic β-Cells : Evidence for the Hexose Monophosphate Pathway for Glucose Metabolism in (Dr. James B. Field, Phyllis Johnson, Betty Herring and Arnold N. Weinberg), 468
Human Prostatic Homogenates *in vitro* : Inactivation of Acid Phosphatase in—Role of Calcium (Prof. H. J. Tagnon and A. [redacted] 48
Human Remains (Fossilized), from Northern Kenya (Dr [redacted]ntworth), 947
Human Sera (Normal) : Inheritance of a New Group-Specific System demonstrated in, by means of an Immuno-Electrophoretic Technique (Dr. Jan Hirschfeld, the late Bengt Jonsson and Marianne Rasmuson), 961
Human Serum and Pituitary Thyrotropic Fractions : Neutralization of, with Antisera to Bovine Pituitary Thyrotropin (Dr. Sidney C. Werner, Ephraim Otero-Ruiz, Beatrice C. Seegal and Robert W. Bates), 472
Human Testicle : Relation of Leydig Cells in the, to the Tubules and Testicular Function (J. B. W. Halley), 865
Human Urine (Normal) : Presence of Metanephrine and Normetanephrine in (Elwood H. LaBrosse and Jay D. Mann), 40
Humane Experimental Technique (Universities Federation for Animal Welfare Symposium on), 893
Humphreys, Stewart R., and others : Immunity of Mice surviving Systemic Leukaemia (L1210) to Antifolic Resistant Variants of the Disease, 219

Humus (Soil) : Radiocarbon Dating of (Prof. C. O. Tamm and H. G. Östlund), 706

Hundred Years of Optics, 505

Hungate, Dr. R. E. : Host Influence on Parasite Physiology (Factors Influencing Rumen Protozoa), 898

Hunter-Jones, Philip : Fertilization of Eggs of the Desert Locust by Spermatozoa from Successive Copulations, 336

Huntsman, R. G., and others . Paradoxical Effect of Magnesium Ions on Blood Coagulation, 852

Hurd, J. C. H. Elected honorary secretary of the Textile Institute, 14

Hurn, B. A L , and others : Paradoxical Effect of Magnesium Ions on Blood Coagulation, 852

Husbandry (Animal), in India . Agriculture and (Dr. M. S. Randhawa), *review* by Colin Clark, 414

Hutchinson, Sir Joseph · The Application of Genetics to Cotton Improvements, *review* by Prof. S. C Harland, 494

Hutton, E., and others : Spectrum of Delayed Fluorescence in Phenanthrene Vapour—a Criterion of Purity, 917

Hutton, W. : Elected a Fellow of the Royal Society of Edinburgh, 734

Hutton, Dr. W. E. : Ionic Exchange and the Structure and Function, including Motility, of Cytoplasmic Membranes, 439

Hveding, D., and others : Fall-out over Norway from High-Yield Nuclear Explosions, 805

Hvinden, T , and others : Fall-out over Norway from High-Yield Nuclear Explosions, 805

Hyacinth . Water—a Curse or a Crop? (N. W. Pirie), 116

Hyaluronidase · Urinary (G. M. Berlyne), 389

Hybrid (First Successful), between the Two Jute-yielding Species, *Corchorus olitorius* L. (Tossa) x *C. capsularis* L. (White), (Ahmad Shamsul Islam and A Rashid), 258

Hybrid Mice (Inbred and F_1) : Response of, to Hormone (Dr. C. K. Chai), 514

Hybridization (Interspecific), among *Mycobacteria* (Dr. Stephen E. Juhasz), 265

Hyde, R. D , and others : Plasma Erythropoietin in Polycythaemia Secondary to Renal Disease, 549

Hydration (Ionic), in Mixtures of Strong Acids and Water (Erik Högfeldt), 760

Hydrazide (Maleic) : Certain Mitotic Effects of Kinetin, Gibberellic Acid, Indoleacetic Acid and, on the Root of *Allium cepa* (M. Annunciata McManus), 44

Hydride (Potassium Rhenium) : Evidence for the Existence of a, and its Bearing on the Nature of the (−1)-Oxidation State of Rhenium (A. P. Ginsberg, J. M. Miller, J. R. Cavanaugh and B. P. Dailey), 528

Hydrocarbon Oxidation : Zone of Negative Temperature Coefficient in (K. C. Salooja), 32

Hydrodynamic Shear (Low) : Sedimentation of Deoxyribonucleic Acid isolated under (Dr. P. F. Davison), 918

Hydrodynamics : Stability Problems in (American Mathematical Society Symposium on), 215

Hydrogen (Atmospheric Molecular) : Growth of the Tritium Content of the (K. F. Bishop and B. T. Taylor), 26

Hydrogen Ion Concentration and Autoclaving : Influence of, on Gibberellin (Dr. James H. M. Henderson), 628

Hydrogen Peroxide (The Sodium Silicate–) System (Dr G. Kakabadse and J. W. Dewsnap), 761

Hydrogenation of Chloroplast Lipids by Rumen Bacteria (Dr. D. E. Wright), 546

Hydrological and Engineering Projects (Mining,), 1958 : Geophysical Surveys in, *review* by Dr. T. F. Gaskell, 200

Hydrolysis (Partial), of Decalcified Human Dentin Collagen : Peptides obtained from (Dr C. C. Solomons), 101

Hydromagnetic Wave Ducts (Global), in the Exosphere (H. A. Bomke, W. J. Ramm, S. Goldblatt and V. Klemas), 299

Hydroperoxides formed under the Influence of Ionizing Radiations : Organic Hydroxy-Hydroperoxides, a Class of (Dr. George Scholes and Prof. Joseph Weiss), 305

Hydrophilic Gels for Biological Use (Prof. O. Wichterle and D. Lím), 117

Hydrops Foetalis : A Fast-moving Haemoglobin in (Dr. Lie-Injo Luan Eng and Dr. Jo Bwan Hie), 698

Hydroxy-Hydroperoxides (Organic), a Class of Hydroperoxides formed under the Influence of Ionizing Radiations (Dr. George Scholes and Prof. Joseph Weiss), 305

β-Hydroxybutyrate Injections : Effect of, on the Pancreatic Activity of Guinea Pigs and Rats (Prof. A. Schwartz, J. Manta, J. Madar and Z. Kis), 771

Hydroxylamine : Oxidation of, in Cell-free Extracts of *Nitrosomonas europaea* (Dr. D. J. D. Nicholas and Dr. O. T. G. Jones), 512

11α-Hydroxylation of Steroids by *Streptomyces* Species (M. Shirasaka and M. Tsuruta), 845

Hydroxyproline Metabolism (Proline and) : Some Interrelated Aspects of (Georg B. Gerber, Gisela Gerber and Kurt I. Altman), 767

5-Hydroxytryptamine : Presence of, after Raunescine in Blood Plasma *in vivo* (Dr. N. T. Karki and Dr. N. K. Paasonen), 109

Hykin, Dr. H W. : Appointed lecturer in mechanical engineering at the Borough Polytechnic, London, 215

Hylander, Dr. N. : At the meeting of the Flora Europaea Organization in Vienna (Taxonomy of Apomicts), 16 ; (Problems of Cultivated, Escap[illegible] Adventive Plants), 17

At the Conference of the Botanical Society of the British Isles to celebrate the Centenary of the publication of the 'Origin of Species' (Trends in Modern Research Work on Scandinavian Plants), 217

Hypercholesterolaemia in Cholesterol-fed Chickens : A Substance in Lingcod Liver Oil which prevents (J. D. Wood and Jacob Biely), 473

Hyperglobulinaemia : Plasma Antihaemophilic-Factor Concentrations in the Australian Aborigine and in Conditions associated with (W. R. Pitney and M. H. Elliott), 397

Hypertension : Adrenocortical Function after Prolonged Salt Restriction in (Dr. Lewis K. Dahl, Dr. Lawrence Silver, Dr. Robert W. Christie and Dr. Jacques Genest), 110

Hypertension after Administration of Corticosteroids : Correlation between the Electrolyte and Water Content of the Organs and (Prof. L. Laszt), 695

Hyperthyroid Rats : Effect of Adrenaline and Insulin upon the Oxygen Consumption of (R. L. Himsworth), 694

Hypnotic Potentiating Principles : Separation of the, from the Essential Oil of *Acorus calamus* L. of Indian Origin by Liquid–Gas Chromatography (Ross M. Baxter, P. C. Dandiya, S. I. Kandel, A. Okany and Prof G. C. Walker), 466

Hypocotyl Growth of Lettuce Seedlings : Effect of Gibberellic Acid on (Dr. B. Frankland and Prof. P. F. Wareing), 255

Hypophysectomy (Foetal) : Effect of, on the Foetal Liver Fat in the Rabbit (Dr. J. G. Bearn), 849

Hypothesis : Radiation Carcinogenesis, a New (Dr. P. R. J. Burch), 135

Hypoxia : Protection against Acute Effects of Radiation by (Dr. Patricia J. Lindop and Prof. J. Rotblat), 593

ICEBERG (Greenland) . Isotopic Distribution in a (W. Dansgaard, G. Nief and E. Roth), 232

Ideas (Scientific) : A Short History of, to 1900 (Dr. Charles Singer), *review* by Dr. William P. D. Wightman, 413

Identification of a Bovine Mucosal-Disease Virus isolated in Sweden as *Myxovirus para-influenzae* 3 (K. Bakos and Dr. Z. Dinter), 549

Identification of the Structure of Non-volatile Organic Substances by Gas Chromatography of Pyrolytic Products (Dr Jaroslav Janák), 684

Iijima, Teiji, and Hagiwara, Atsuyoshi . Mutagenic Action of Mitomycin C on *Escherichia coli*, 395

Ikeda, T. (Yoshida, S., and) : Dark Blue Ring developed by Electron Bombardment in Rock Salt, 755

Ikonen, M. (Niemi, Dr. Mikko, and) Histochemical Evidence of Aminopeptidase Activity in Rat Pineal Gland, 928

Image Intensifier with Transmitted Secondary Electron Multiplication (W. L. Wilcock, D. L. Emberson and B. Weekley), 370

Images (Retinal) : Monocular 'Rivalry' between Stabilized and Unstabilized (Dr. D. M. MacKay), 834

Immergut, E. H., and others : At the Ninth Canadian High Polymer Forum (The Cationic Copolymerization of Propylene and Isoprene), 359

Immune Chicken Antibody . Haemolytic Properties of (Prof. B. D. Janković and Dr. K. Isaković), 322

Immunity of Mice surviving Systemic Leukaemia (*L*1210) to Antifolic Resistant Variants of the Disease (Dr. Abraham Goldin, Stewart R. Humphreys, Gerald O. Chapman, Dr. Michael A. Chirigos and John M. Venditti), 219

Immunity (Tumour) : A New Approach to (Dr. Kurt Stern), 787

Immunization (Diathelic), of Sheep against a Rat Cancer (Prof. B. Sekla and E. Holečková), 618

Immunizing Agent against Virus Infection : Native Protein, an (Dr. G. Loebenstein), 122

Immuno-Analysis (Quantitative), in Gel Plates (Dr. J. G. Feinberg), 555

Immunochemical Observations on Antisera to Purified Human Growth Hormone (Prof. Melvin M. Grumbach, Dr. Selna L. Kaplan and Dr. Sheila Solomon), 170

Immunoelectrophoresis : Shape of the Precipitate in (Dr. Jan Hirschfeld), 164, *erratum*, 507

Immunoelectrophoretic Analysis (A Starch Gel), of Human γ-Globulin demonstrating the Inter- and Intra-Specific Variation of Organisms (Dr. Morris Goodman), 474

Immuno-Electrophoretic Technique : Inheritance of a New Group-Specific System demonstrated in Normal Human Sera by means of an (Dr. Jan Hirschfeld, the late Bengt Jonsson and Marianne Rasmuson), 931

Immunological Reactions : Antigen–Antibody in Liquid Two-Phase Systems —a Method for Studying (Per-Åke Albertsson and Lennart Philipson), 38

Impact of *Lunik II* Observations related to the (G. Fielder), 11

Imperial Chemical Industries, Ltd. : Work of the Game Research Station at Fordingbridge, 889

Grant of £1,500 to the Department of Inorganic and Structural Chemistry, University of Leeds, to support X-Ray structure analysis, 892

Imperial College of Science and Technology, London . Appointment of Prof K. G. Denbigh to the University of London chair of chemical engineering science, 14

Course of Lectures on Reactor Fuel Element Technology, 215

Inaugural Lectures delivered during 1956-57 and 1957-58, 433

Appointment of C. B. Winsten to the University of London readership in statistics, 737

Summer School of Health Physics (Radiation Protection), 815

Biochemistry at the, 895

Benefaction of £350,000 from the Isaac Wolfson Foundation, to build and equip new laboratories for biochemistry and chemical microbiology, 895

Appointment of Prof. E. B. Chain to the chair of biochemistry, 895

Implantation of Tissue Transplants in the Uteri of Pseudopregnant Mice (Ian B. Wilson), 553

Implications (Geological), of Recent Geophysical Work in the British Isles (Geological Society of London Symposium on), 76, 739

Importance in the Treatment of Tumours in Animals and Man : Actinomycins and their (New York Academy of Sciences Conference on), 76

Important Raw Materials, *review* by Dr. F. Lyth Hudson, 646

Improved Fish-Locator and Navigational Instrument : Electronic Sector-Scanning Asdic, an (Prof D. G. Tucker and Dr. V. G Welsby), 277

Improvement of Niger and Benue : River Studies and Recommendations on (Nedeco, Netherlands Engineering Consultants), *review* by Prof. W. G. V. Balchin, 274

Improvements (Cotton) : The Application of Genetics to (Sir Joseph Hutchinson), *review* by Prof S C. Harland, 494

In-Patient Statistics (Hospital) : Registrar General's Statistical Review of England and Wales for the Year 1955—Supplement on (General Register Office), 214

Inactivation of Acid Phosphatase in Human Prostatic Homogenates *in vitro* —Role of Calcium (Prof H J. Tagnon and A. Steens-Lievens), 48

Inactivation of Erythropoietin by Neuraminidase and by Mild Substitution Reactions (Dr Peter H. Lowy, Dr. Geoffrey Keighley and Dr. Henry Borsook), 102

Inactivation Curves (Ultra-Violet), of Transforming Deoxyribonucleic Acid : Shape of (Claud S. Rupert and Sol H. Goodgal), 556

Inadequacy of Scatter Mechanisms in Tropospheric Radio Propagation (P. C. M. de Belatini), 76

Inaugural Lectures delivered at the Imperial College of Science and Technology during 1956-57 and 1957-58, 433
Inbred and F_1 Hybrid Mice . Response of, to Hormone (Dr. C. K Chai), 514
Incisors of Grazing Sheep : Attrition of (C. R. Barnicoat and D. M. Hall), 179
Incompatibility in *Prunus avium* : Effect of Selection on the Frequency of Genotypes determining (Watkin Williams and J. S. Gale), 944
Incompatibility (Seed), in *Primula* (Prof. D H. Valentine and Dr. S. R. J. Woodell), 778
Incorporation of 2-^{14}C-Sodium Pyruvate into Glyceride Glycerol : Influence of Insulin on the, in Diabetic and Normal Baboons (N. Savage, Prof. J. Gillman and C Gilbert), 168
Incorporation of α,ω-Dicarboxylic Acids as Side-Chains into the Penicillin Molecule (A. Ballio, Prof. E. B. Chain, F. Dentice di Accadia, Maria Francesca Mastropietro-Cancellieri, G. Morpurgo, G. Serlupi-Crescenzi and G. Sermonti), 97
Incorporation of Orthophosphate Labelled with Phosphorus-32 into Cerebral Phospholipids *in vivo* (Dr. G B. Ansell and S Spanner), 826
Incorporation of Phosphorus-32 into the Nucleotides of Deoxyribonucleic Acid of Rat Thymus Cells : Labelling of Deoxyribose with Carbon-14 in relation to (Dr. S Itzhaki), 614
Incorporation of Tritiated Uridine into Amphibian Eggs (N. Bieliavsky and R. Tencer), 401
Incorporation of Tritium-labelled Thymidine and Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid after Irradiation of the Deoxyribonucleic Acid Primer with γ-Rays (Dr. S Okada), 193
Incorporation of Tyrosine labelled with Carbon-14 into Protein of *Mycobacterium* Cell Fractions *in vivo* : Effect of Streptomycin on the (Dr. T. Erdos and Dr. Agnes Ullmann), 100
Increases in the Local Gamma-Ray Background due to Nuclear Bomb Fall-out (J. Vennart), 722
Incubation Mixtures containing Glycine-2-^{14}C and Turkey Liver Homogenates : Isolation of Radioactive Vitamin B_{12} from (Pran Vohra and F. H. Kratzer), 45
India : Agricultural Research in, *review* by Colin Clark, 414
    Agriculture and Animal Husbandry in (Dr. M. S. Randhawa), *review* by Colin Clark, 414
    Infant Mortality in, 1901-55 (Prof. S Chandrasekhar), *review* by Prof. L. Dudley Stamp, 801
    Mechanical Cultivation in (D A. Gadkary), *review* by Colin Clark, 414
    A New Palaeolithic Find in Tapti Valley, Khandesh (Prof C. R. Karnik), 711
Indian Botanical Society : Birbal Sahni Medal for 1959 awarded to Prof. P. Parija, 893
Indian Council of Agricultural Research (Unesco and the) : Symposium on Algology, 820
Indian Meteorological Department : Retirement of Shri S. Basu as director-general of observatories, 811
    Appointment of Shri P. R. Krishna Rao as director-general of observatories, 812
Indian Origin : Separation of the Hypnotic Potentiating Principles from the Essential Oil of *Acorus calamus* L. of, by Liquid–Gas Chromatography (Ross M. Baxter, P. C. Dandiya, S. I. Kandel, A. Okany and Prof. G. C. Walker), 466
Indian Science News Association : Silver Jubilee of *Science and Culture*, 354
Indians (Oyana and Carib) · Distribution of Gm^a and Gm-like among Javanese, Djuka Negroes, and (Prof Arthur G. Steinberg, Rachel Stauffer and Hugh Fudenberg), 324
Indians (South American) : Publication of the Index to the Handbook of (Bureau of American Ethnology of the Smithsonian Institution), 815
Individual in Modern Society : The Worth of the, 641
Individual Amino-Acids : Selective Biological Membrane Transport of (Dr. S. M. Hardy), 245
Individual Specific Nature of the Cold Auto-Antibodies of Acquired Haemolytic Anaemia (Dr. T. N. Mehrotra), 323
Indole Acetic Acid : Differentiation Induced as Season Advances in the Embryo-Gametophyte Complex of *Pinus nigra* var. *austriaca*, using (Prof. Norman W. Radforth and Dr. J. M. Bonga), 332
Indoleacetic Acid and Maleic Hydrazide (Kinetin, Gibberellic Acid,) : Certain Mitotic Effects of, on the Root of *Allium cepa* (M. Annunciata McManus), 44
Induced Proliferation (Experimentally), of the Rudimentary Gonad of an Intact Domestic Fowl (Prof W. Kornfeld), 320
Induced Synthesis of β-Galactosidase in *Escherichia coli* : Role of the Inducer in the (Prof. H. V. Rickenberg), 240
Inducer : Role of the, in the Induced Synthesis of β-Galactosidase in *Escherichia coli* (Prof H. V. Rickenberg), 240
Induction of Traps of Nematophagous Fungi using *Panagrellus redivivus* (Dr. Armen C. Tarjan), 779
Induction of a Vascular Permeability Factor by the Interaction of Guinea Pig Tissue Debris with Serum (Dr. P. J. Mill), 246
Induction (Nuclear) : Theory and Applications of (Prof. Ajit Kumar Saha and Tara Prasad Das), *review* by W. M. Lomer, 67
Inductive Phase of Antibody Formation by 6-Merceptopurine : Inhibition of the, examined by the Transfer of Isolated Cells (Dr. J. Sterzl), 256
Industrial Archaeology (Research Committee on Industrial Archaeology of the Council for British Archaeology Conference on), 357
Industrial Chemistry of the Lower Olefines (Chemical Society, the Institute of Petroleum, the Royal Institute of Chemistry and the Society of Chemical Industry Symposium on), 660
Industrial Development, 1800 to the Present Day : The Rhondda Valleys—a Study in (E. D. Lewis), *review* by Prof. L. Dudley Stamp, 415
Industrial Gums—Polysaccharides and their Derivatives (edited by Roy L. Whistler and James N. BeMiller), *review* by Dr. S. A. Barker, 414
Industrial Research Associations—Some Taxation Problems, 63
Industrialists (Technical) : Nuclear Energy for Engineers and (European Nuclear Energy Agency of the Organization for European Economic Co-operation Courses on), 506
Industries (Wood-using) : Development of (Sir Harry Champion), 894
Industry : Petroleum, *review* by Prof. F. Morton, 201
Industry (American) : Scientists and Engineers in (United States National Science Foundation), 213
Industry (Manufacturing) . Training Unskilled and Semi-Skilled Operatives in (W. D. Seymour), 509
Industry (Research and), in Great Britain, 506
Infant Mortality in India, 1901-55 (Prof. S. Chandrasekhar), *review* by Prof. L. Dudley Stamp, 801
Infection of Peas by Wilt Disease Fungi (Shirley Hepple (Mrs. D. L. Lee)), 333
Infection by *Xanthomonas malvacearum* (E F S.) Dowson : Effect of, on Respiration-rate of Cotton Leaves (Dr. H. M. Hassan and K. A. Sabet), 177
Infection (Influenza A'), of Cultured Cells of Whole Mouse Embryos (J. V. T. Gostling), 328
Infection (*Pertussis*) : Histamine Sensitivity in Children after (Dr. R. K. Sanyal), 537
Infection (Virus) Native Protein, an Immunizing Agent against (Dr. G. Loebenstein), 122
Infections (Babesial) : 3 3'-Diamidinocarbanilide, a New Drug Active against (Dr. J. N. Ashley, S. S Berg and J. M. S. Lucas), 461
Infective Nucleic Acid : Role of, in the Production of Encephalomyocarditis Virus (Dr. F. K. Sanders), 802
Infectivity of *Entamoeba invadens* in Snakes : Thermal Barrier to the (Dr. E. Meerovitch), 631
Influence of Cobalt and Zinc Ions on the Growth and Porphyrin Production of *Mycobacterium tuberculosis avium* (Dr. D. S. P. Patterson), 57
Influence of Ejaculation Frequency on the Time required for Sperm Formation and Epididymal Passage in the Bull (Dr. H H. Koefoed-Johnsen), 49
Influence of Filming and of Surface Texture on the Settlement of Marine Organisms (Dr. D. J. Crisp and J. S Ryland), 119
Influence of Guinier–Preston Zones on the Electrical Resistivity of Age-hardening Alloys (C. W. Morley and B. D Burns), 914
Influence of Hydrogen Ion Concentration and Autoclaving on Gibberellin (Dr James H. M. Henderson), 628
Influence of Insulin on the Incorporation of 2-^{14}C-Sodium Pyruvate into Glyceride Glycerol in Diabetic and Normal Baboons (N. Savage, Prof. J. Gillman and C. Gilbert), 168
Influence of Insulin on this Process : Effects of Starvation on the Ability of Isolated Rat Diaphragm to Incorporate Labelled Amino-Acids into its Protein and to Respond to the (Dr. K L. Manchester), 907
Influence of Ionizing Radiations : Organic Hydroxy-Hydroperoxides, a Class of Hydroperoxides formed under the (Dr. George Scholes and Prof Joseph Weiss), 305
Influence of Nitrogen-containing Bases on the Rate of the Electrode Processes at the Dropping Mercury Electrode (V. Volková), 743
Influence of Sorbic Acid on Acetate Oxidation by *Saccharomyces cerevisiae* var. *ellipsoideus* (Prof. Norberto J. Palleroni and María J R. de Pritz), 688
Influence (Host), on Parasite Physiology (Bureau of Biological Research Conference on), 897
Influenza A' Infection of Cultured Cells of Whole Mouse Embryos (J V. T. Gostling), 328
Information on Automatic Programming of Digital Computers, National Centre of (Brighton Technical College), 214
Information Services : British Overseas, 506
Infra-Red Absorption Analysis : Determination of Tetrahedral Aluminium in Mica by (Dr R J. P. Lyon and Dr W. M. Tuddenham), 374
Infra-Red Determination of the Kaolin Group of Minerals (Dr. R. J. P. Lyon and Dr W M Tuddenham), 835
Infra-Red Double-Beam Spectrophotometers : Emission Spectroscopy with (J Braunbeck), 754
Infra-Red Spectra of Capsular Polysaccharides from Thirteen Strains of *Cryptococcus neoformans* (Dr. H. H. Gadebusch), 610
Ingalls, R. P , and others : Observed Characteristics of an Ultra-High-Frequency Signal Traversing an Auroral Disturbance, 510
Ingested Radiostrontium (Chronically) : Effectiveness of Dietary Substances in reducing the Retention of—Studies with Tannin (Prof. R. H. Wasserman and Dr. C. L. Comar), 629
Inhaled Particles and Vapours (British Occupational Hygiene Society Symposium on), 14, 433
Inheritance of a New Group-Specific System demonstrated in Normal Human Sera by means of an Immuno-Electrophoretic Technique (Dr. Jan Hirschfeld, the late Bengt Jonsson and Marianne Rasmuson), 931
Inhibition of the Inductive Phase of Antibody Formation by 6-Mercaptopurine examined by the Transfer of Isolated Cells (Dr. J. Sterzl), 256
Inhibition of Lipid Peroxidation in Microsomes by Vitamin E (Dr. A. L. Tappel and Dr. H Zalkin), 35
Inhibition of Mitosis : Withdrawal of, as a Mechanism influencing Normal and Pathological Growth (Dr J. T. Hemingway), 106
Inhibition of Monoaminoxidase by Aliphatic Compounds : Dependence of Periodic Activation and, upon Chain-length (Dr. George C. Cotzias and Dr. James J. Greenough), 384
Inhibition (Corrosion), and the Zero Charge Potential of Metals (Dora M Brasker), 838
Inhibition (A Reversible), of Photosynthesis in Synchronized Cultures of Algae (Dr. Constantine Sorokin), 933
Inhibitor . An Antibody (Dr Jack G. Makari), 747
Inhibitor (Growth), and a Natural Germination Stimulator in the Dormancy of *Fraxinus excelsior* L : Interaction of (T. A. Villiers and Prof. P. F. Wareing), 112
Inhibitory Actions of γ-Aminobutyrylcholine (M. Asano, T. Noro and K. Kuriaki), 848
Initiation of Zygospores of *Rhizopus sexualis* : A Po[redacted]p between Nucleic Acid Metabolism and the (P. [redacted]epden and Dr. B. F Folkes), 254
Initiation (Drainage), by Seepage Moisture on a Gritstone Escarpment in Derbyshire : Bedrock Corrosion and (B. T. Bunting), 447
Initiation (Flower), and Stem Extension in Petkus Winter Rye · Effect of Gibberellin on the (Dr. O N. Purvis), 479
Injection of a Hepatotoxin directly into the Gall-Bladder of Rabbits : Effect of (Dr. N. A. Worker), 785
Injections (β-Hydroxybutyrate) : Effect of, on the Pancreatic Activity of Guinea Pigs and Rats (Prof. A. Schwartz, J. Manta, J. Madar and Z. Kis), 771
Injury (Early), of Chromoexcretion after Total Irradiation of Rats (Zdenek Dienstbier and Oskar Andrysek), 630
Injury (Liver) : Effect of Antihistamines on Mitochondrial Swelling and (Dr. J. D. Judah), 390
Innervation (Fine), of the Carotid Body of the Rhesus Monkey (R. P. Gould), 183

Inoculation of Adult Fowl Leucocytes . Chorioallantoic Membrane Lesions produced by (Dr. Georgiana Boyer), 327
Inorganic Chemistry (University of Toronto Symposium on), 433
Inorganic Ions · Effect of Cardiac Glycosides and, on Binding of Serotonin by Platelets (Herbert Weissbach, Betty G Redfield and Elwood Titus), 99
Inorganic Nitrogen in Animal Tissues : Enzymatic Cycle of (Dr. K. Yamafuji, Y. Osajima and H Omura), 162
Inorganic Phosphate : Need for, in Oxidations stimulated by Dinitrophenol (P. Borst and Prof E. C Slater), 537
Inorganic Salts and Native Serum Proteins · Cell-Growth of Plant Roots, (Dr Folke Rønnike), 151
Inorganic Sulphate : Effect of, on Molybdenum Excretion by a Marsupial (Shelley Barker), 41
Inositol (Liver Phosphatidyl) : Configuration of Inositol Phosphate in (Dr. J. N. Hawthorne, P. Kemp and R B. Ellis), 37
Inositol Phosphate · Configuration of, in Liver Phosphatidyl Inositol (Dr. J N. Hawthorne, P. Kemp and R. B Ellis), 37
Insect Cuticle : Homocatechol in an (S R A. Malek), 56
Insect Morphology . Manual of (Prof. E Melville DuPorte), *review* by H. Oldroyd, 3
  Practical, *review* by H Oldroyd, 3
Insect Neurosecretory Cells *in situ* : A Method of Controlling the Temperature of (R. H. J. Brown and Janet E. Harker), 392
Insonation (Ultrasonic) : Effect of, on the Carbon Tetrachloride–Water–DissolvedHelium System (Martin R. Levy), 159
Inspection : Factors in Prolonged Work, especially (Ergonomics Research Society Symposium on), 356, 893
Institut Royal Météorologique de Belgique . Publications Série A, No. 10, Sur le Comportement des Pluviomètres (Dr. L. Poncelet), 438
Instrument (Navigational) : Electronic Sector-Scanning Asdic, an Improved Fish-Locator and (Prof. D G. Tucker and Dr. V. G. Welsby), 277
Instrument Technology, Society of : Conference on the Value of Instruments and Automatic Control to the Smaller Firm, 737
Instruments and Automatic Control : Value of, to the Smaller Firm (Society of Instrument Technology Conference on), 737
Insulin · Effect of Adrenaline and, upon the Oxygen Consumption of Hyperthyroid Rats (R. L. Himsworth), 694
  Effect of Testosterone Propionate and, on Muscle Cholinesterase Activity (A. N. Granitsas, N Dede and Dr. A J Philippu), 320
  Influence of, on the Incorporation of 2-^{14}C-Sodium Pyruvate into Glyceride Glycerol in Diabetic and Normal Baboons (N. Savage, Prof. J. Gillman and C. Gilbert), 168
  Effects of Starvation on the Ability of Isolated Rat Diaphragm to Incorporate Labelled Amino-Acids into Its Protein and to Respond to the Influence of, on this Process (Dr. K. L. Manchester), 907
Intact Domestic Fowl : Experimentally Induced Proliferation of the Rudimentary Gonad of an (Prof W. Kornfeld), 320
Intakes (High), of Sulphate and Molybdate : Demyelination in Lambs born of Ewes maintained on (C. F. Mills and B. F. Fell), 20
Intelligence, Personality and Brain Rhythms in a Socially Isolated Community (A C Munday-Castle and G. K. Nelson), 484
Intensifier (An Image), with Transmitted Secondary Electron Multiplication (W. L. Wilcock, D. L Emberson and B Weekley), 370
Inter- and Intra-Specific Variation of Organisms : A Starch Gel Immunoelectrophoretic Analysis of Human γ-Globulin demonstrating the (Dr. Morris Goodman), 474
Interaction of Growth Inhibitor and a Natural Germination Stimulator in the Dormancy of *Fraxinus excelsior* L. (T. A. Villiers and Prof. P. F. Wareing), 112
Interaction of Guinea Pig Tissue Debris with Serum : Induction of a Vascular Permeability Factor by the (Dr. P J. Mill), 246
Interaction between the Plasma of the Loggerhead Turtle and Toxin of the Portuguese Man-of-War (Dr. Eleanor Dodge Wangersky and Prof. Charles E. Lane), 330
Interactions between Pharmacodynamic and Placebo Effects in Drug Evaluations in Man (Dr Walter Modell and Dr. Margaret Garrett), 538
Interactions (Electron–Phonon), in Solids (Physical Society Conference on), 586
Interferometric Studies on Synthetic Diamonds (Prof. S Tolansky and Dr. I. Sunagawa), 203
Interlaminate Figures of Sessile Barnacle Shells (R. Read), 778
Interlingua, 587
Intermediary Metabolism of Nitrobenzoic Acids by Bacteria (R. B. Cain and N. J. Cartwright), 868
Intermediate in Microbial Synthesis of Cysteine : Cysteine-S-sulphonate as an (Dr. Taro Nakamura and Dr Ryo Sato), 163
Intermediate Diamond Structure · Alleged Formation of an, on Heating Diamond (Dr. F. A. Raal), 523
International Association for the Exchange of Students for Technical Experience : Students exchanged during the Summer Vacation of 1959, 355
International Astronomical Union : Symposium No. 7, Co-ordination of Galactic Research (Stockholm, 1957), (edited by A. Blaauw, G. Larsson-Leander, N. G. Roman, A. Sandage, H. F. Weaver and A. D. Thackeray), *review*, 801
International Atomic Energy Agency : Conferences and Symposia in 1960, 145
  First Research grant under the Exchange and Training Programme awarded [illegible] Dr R. P. Agarwala, 354
International Committee on Laboratory Animals (Dr. W. Lane-Petter), 508
International Computer Federation, 285
International Conference on Congenital Malformations (International Medical Congress, Ltd), 507
International Conference on Radioisotopes in Scientific Research : Proceedings of the (sponsored by Unesco, Paris, 1957), (edited by Prof. R. C. Extermann), Vol. 1, Research with Radioisotopes in Physics and Industry ; Vol. 2, Research with Radioisotopes in Chemistry and Geology, *review* by Dr. H. Seligman, 415 ; Vol. 3, Research with Radioisotopes in Human and Animal Biology and Medicine ; Vol. 4, Research with Radioisotopes in Plant Biology and some General Problems, *review* by Prof. Otto Hug, 876
International Congress on High-Speed Photography (Society of Motion Picture and Television Engineers), 14
International Congress on Nutrition : Fifth (International Union of Nutritional Sciences), 507
International Congress in Photobiology, 893
International Federation of Computer Societies : Academy of Sciences of the U S S.R. to join the, 507
International Medical Congress, Ltd. · International Conference on Congenital Malformations, 507
International Mineral Processing Congress (Institution of Mining and Metallurgy), 893
International Sericultural Commission : Second International Technical Sericultural Conference, 76
International Society of Tropical Ecology : Inauguration of the, 433
  Election of Officers for 1960–61, 433
International Spring School of Physics of the Istituto di Fisica Teoretico of the University of Naples, 893
International Starch Conference, 507
International Symposium on Crop Protection : Twelfth (Agricultural College of the University of Ghent), 286
International Symposium on Fermentation (Istituto Superiore di Sanità, the American Chemical Society (Fermentation Subdivision), and the Società Chimica Italiana), 14
International Symposium on Growth—Molecule, Cell and Organism (Purdue University), 507
International Symposium on Inhaled Particles and Vapours (British Occupational Hygiene Society), 14, 433
International Symposium on Planning in Science (Czecho-Slovak Union of Scientific Workers), 738
International Tables for X-Ray Crystallography (edited by John S. Kasper and Dame Kathleen Lonsdale), Vol. 2, Mathematical Tables, *review* by Dr A. R Stokes, 129
International Tagging Test with Salmon (*Salmo salar* L) Smolts (A. Swain and P. E. Caradine), 206
International Technical Sericultural Conference : Second (International Sericultural Commission), 76
International Union for Conservation of Nature and Natural Resources : Bulletin 8, Protection of Nature in the Soviet Republic of Azerbaijan (G. Aliev), 580
International Union of Nutritional Sciences : Fifth International Congress on Nutrition, 507
Interplanetary Gas · Erosion of Meteorites in Space and the Density of (Dr. L. Reiffel), 821
Interplanetary Space : Low-Energy X-Rays from (Dr. L. Reiffel), 229
Interpretation of Potentiometric Titration of H-Montmorillonite (Dr. A. M. Pommer and Dr. D. Carroll), 595
Interpretation (An Alternative), of the Supposed Giant Deciduous Hominid Tooth from Olduvai (Dr. J. T Robinson), 407 ; (Dr. L. S. B. Leakey), 408
Interpretation (Functional), of the Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* in Terms of Directional Sensitivity (Prof. O. Lowenstein and J. Wersall), *errata*, 76
Interrelated Aspects of Proline and Hydroxyproline Metabolism : Some (Georg B. Gerber, Gisela Gerber and Kurt I. Altman), 767
Interspecific Hybridization among *Mycobacteria* (Dr. Stephen E. Juhasz), 265
Interstitials and Fracture of Metals (Dr. T. E. Scott and Dr. A. R. Troiano), 372
Intestinal Absorption : Reduction of, by a Synthetic Chemical (Dr. J. A. Nissim), 222
Intestinal Motility : Effect of Different Types of Milk on (Prof. A. H. Mohamed, O Zaki, K. Zaki and L. Fahim), 773
Intestine (Small) : Biosynthesis of Glycerides in the Mucosa of the (Dr. B. Clark and Dr. G. Hubscher), 35
Intracellular Potassium in Dietary Liver Necrosis (A. E. M McLean), 936
Intra-Specific Variation (Inter- and), of Organisms : A Starch Gel Immunoelectrophoretic Analysis of Human γ-Globulin demonstrating the (Dr. Morris Goodman), 474
Intrastrain Transduction in *Proteus mirabilis* (Prof. J. N Coetzee and T. G. Sacks), 869
Introducing Astronomy (J. B. Sidgwick), *review* by B. R. Leaton, 131
Investigation (Oscillographic), of Electrodeposition of Chromium (Hideya Okada, Kenji Nākamura and Takeo Ishida), 377
Inyanga—Prehistoric Settlements in Southern Rhodesia (Roger Summers), *review* by Dr. Revil Mason, 65
Iodide (Cadmium), and Mercuric Chloride · Ultrasonic Velocities in Aqueous Mixtures of (S. V. Subrahmanyam), 371
Iodine-131 : Casein labelled with, as a Substrate for the Measurement of Trypsin and Chymotrypsin (Dr. Bernard J. Katchman, Dr. Robert E. Zipf and Dr. George M. Homer), 238
Ion (Hydrogen) Concentration and Autoclaving : Influence of, on Gibberellin (Dr. James H. M Henderson), 628
Ion Beam Currents : Measurement of, using a Hall Effect Magnetometer (W. S. Whitlock and C. Hilsum), 302
Ionic Exchange and the Structure and Function, including Motility, of Cytoplasmic Membranes (Dr. W. E. Hutton), 439
Ionic Hydration in Mixtures of Strong Acids and Water (Erik Hogfeldt), 760
Ionization induced by Artificial Earth Satellites : Observations of (Prof. John D. Kraus, Robert C Higgy, Donald J. Scheer and W. Reed Crone), 520
Ionizing Radiation : Effect of, upon Xanthosine in Dilute Aqueous Solution (Dr. G. Hems), 525
Ionizing Radiations : Organic Hydroxy-Hydroperoxides, a Class of Hydroperoxides formed under the Influence of (Dr. George Scholes and Prof Joseph Weiss), 305
Ionizing Solvents : Oxidation Reduction Reactions in (Faraday Society General Discussion on), 893
Ionosphere : Variation of Electron Density in the, with Magnetic Dip (Sheila Croom, Audrey Robbins and J. O. Thomas), 902
Ionosphere Height (Constant), for Audiofrequency Propagation (F. Hepburn), 599
Ions (Cobalt and Zinc) : Influence of, on Growth and Porphyrin Production of *Mycobacterium tuberculosis avium* (Dr. D. S. P. Patterson), 57
Ions (Inorganic) : Effect of Cardiac Glycosides and, on Binding of Serotonin by Platelets (Herbert Weissbach, Betty G. Redfield and Elwood Titus), 99
Ions (Magnesium) : Paradoxical Effect of, on Blood Coagulation (R. G. Huntsman, B. A. L. Hurn and Dr. H. Lehmann), 852
Ions (Metal) : Fungitoxicity of (Dr. Lawrence P. Miller), 545

Iraq : Solar Stills in (Dr. A V. Brancker), 362
Ireland (Great Britain and) . The Future of Non-Ferrous Mining in—Proceedings of a Symposium arranged by the Institution of Mining and Metallurgy in collaboration with the United Kingdom Metal Mining Association, 1958, *review* by Prof. K. C. Dunham, 801
Iriki, Yoshihiko, and Miwa, Tomoo · Chemical Nature of the Cell Wall of the Green Algae, *Codium*, *Acetabularia* and *Halicoryne*, 178
Iron : Release of, from Conjugates in Food (Rona Sanford), 533
Iron and Steel : Determination of Oxygen in (M L. Pearce and C. R. Masson), 373
Iron–Vanadium Sigma Phase : Variation of Magnetic Moment with Composition in the (Dr. D Parsons), 839
Iron Bacteria . Growth of, in Crude Tar (P. H. Garnett), 942
Iron Meteorites 'Carbo' and 'Treysa' : Calculation of Cosmic-Ray Ages in the (Dr. H. Voshage and Dr. H. Hintenberger), 88 , (Dr. Royal R. Marshall), 89
Irradiated Films (Ultra-Violet), of Nucleic Acids : Aggregation and Staining Behaviour of (Prof. D. Shugar and Dr. J. Baranowska), 33
γ-Irradiated, Substituted Toluenes : Electron Spin Resonance of (N. K. Bridge), 30
Irradiated Thiols and Disulphides : Electron Paramagnetic Resonance Observations on (T. Henriksen and A. Pihl), 307
Irradiation of the Deoxyribonucleic Acid Primer with γ-Rays : Incorporation of Tritium-labelled Thymidine and Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid after (Dr. S. Okada), 193
Irradiation (Total), of Rats . Early Injury of Chromoexcretion after (Zdenek Dienstbier and Oskar Andrysek), 630
Irrigated Field Environments (Simulated Pond, Wet Meadow and) : Accumulation of Caesium-137 by Plants grown in (Dr. R. C. Pendleton and Dr. R. L. Uhler), 707
Irvine, James E., and Freyre, Rubén H. : Reversal of Genetic Dwarfism in *Tephrosia vogelii* by Gibberellin, 115
Irving, E. (Bull, C., and) : Palaeomagnetism in Antarctica, 834
Irving, F. G., and Stollery, J. L. : The Way to the Stars, *review*, 798
Irving, Dr. Laurence Human Adaptation to Cold, 572
Is there a Leakage of Acetylcholine from Postganglionic Parasympathetic Nerve Endings ? (Prof. N. Emmelin), 297
Isaković, Dr. K. (Janković, Prof. B. D , and) : Haemolytic Properties of Immune Chicken Antibody, 322

Lavee, S.: Effect of Gibberellic Acid on Seeded Grapes, 395
Law, Phillip G.: Awarded the Founder's Medal of the Royal Geographical Society, 735
Law (Scientific): Chance and Providence—God's Action in a World governed by (Dr. William G. Pollard), *review* by the Rev. Dr. E. L. Mascall, 875
Lawrie, T. R. M.: Elected a Fellow of the Royal Society of Edinburgh, 734
Lawson, Dr. J. D.: Awarded a moiety of the Lyell Fund of the Geological Society of London, 657
Layer Planes of Artificial and Natural Graphites: X-Ray Measurement of Thermal Expansion Perpendicular to the (E. G. Steward and B. P. Cook), 78
Layer Structures (Non-metallic): Observation of Dislocations in (S. Amelinckx and P. Delavignette), 603
Lead Azide: Products of Decomposition of (M. Stammler, J. E. Abel and J. V. R. Kaufman), 456
Leakage of Acetylcholine from Postganglionic Parasympathetic Nerve Endings: Is there a? (Prof. N. Emmelin), 297
Leakey, Dr. L. S. B.: An Alternative Interpretation of the Supposed Giant Deciduous Hominid Tooth from Olduvai, 408
Leaton, B. R.: Introducing Astronomy, *review*, 131
Leaves: Polysaccharide Composition of (P. Andrews, Dr. L. Hough and B. Stacey), 166
Leaves (Cotton): Effect of Infection by *Xanthomonas malvacearum* (E. F. S.) Dowson on Respiration-rate of (Dr. H. M. Hassan and K. A. Sabet), 177
Lebeau, Prof. P.: *Obituary* by Prof. W. H. Linnell, 429
Leberman, Dr. R., and Rabin, Dr. B. R.: Copper(II) Complexes of Histamine and 3-Methyl Histamine, 768
Lecture (Christmas), of the Institute of Welding (Prof. H. O'Neill), 14
Lectures on Foundry Sands (Borough Polytechnic, London, Course of), 286
Lectures on Lubrication and Lubricants (Borough Polytechnic, London, Course of), 286
Lectures on Reactor Fuel Element Technology (Imperial College of Science and Technology Course of), 215
Lectures on the Scientific Basis of Medicine (British Postgraduate Medical Federation, University of London), Vol. 7, 1957-58, *review* by Prof. R. A. McCance, 202
Lectures on Spectroscopic Methods of Pharmaceutical Analysis (Brighton Technical College School of Pharmacy Course of), 76
Lectures on Variety Reduction in Engineering (Borough Polytechnic, London, Course of), 286
Lectures (Inaugural), delivered at the Imperial College of Science and Technology during 1956-57 and 1957-58, 433
Leeper, Prof. G. W.: Introduction to Soil Science, third edition, *review* by Dr. R. M. S. Perrin, 2
Lees, Dr. D. S.: Appointed to a senior lectureship in economics at the University College of North Staffordshire, 737
Lees, G.: Appointed lecturer in road materials in the Department of Civil Engineering, University of Birmingham, 892
Leeson, Colonel B. H.: Elected to honorary membership of the Institution of Electrical Engineers, 431
Lehmann, Dr. H.: Appointed to the University of London readership in chemical pathology at St. Bartholomew's Hospital Medical College, 506
Lehmann, Dr. H., and others: Paradoxical Effect of Magnesium Ions on Blood Coagulation, 852
Leishmania donovani: Carbon Dioxide Assimilation by (Dr. A. N. Chatterjee and Dr. J. J. Ghosh), 322
Lemon (Ponderosa): Flavonoids of the (Robert M. Horowitz and Bruno Gentili), 319
Lenz, R. W., and Carrington, W. K.: At the Ninth Canadian High Polymer Forum (The Preparation of Phenylene Sulphide Polymers by the Macallum Polymerization), 360
Leopoldina Academy of Sciences: Election of new Members, 506
Leopoldville: Palaeoliths at (H. van Moorsel), 286
Leprosy Bacillus (*Mycobacterium lepraemurium*): Elongation of a, in a Cell-free Medium (Dr. P. D'Arcy Hart and Dr. R. C. [illegible]), 58
Lerner, Dr. Aaron B. (Wright, Dr. M. Ruth, and): Action of Thyroxine Analogues on Frog Melanocytes, 169
Lesions (Cerebellar and Midbrain), in Scrapie (Dr. I. Zlotnik), 785
Lesions (Chorioallantoic Membrane), produced by Inoculation of Adult Fowl Leucocytes (Dr. Georgiana Boyer), 327
Lethal Dose (Cellular), and the Critical Cell Number for the *C3H* Mouse Mammary Carcinoma: Estimation of the, from Radiosensitivity Studies *in vivo* (A. Cohen and L. Cohen), 262
Lettere a una Principessa Tedesca (Leonhard Euler), (a cura di Gianfranco Cantelli), *review* by L. Roth, 717
Lettuce Seedlings: Effect of Gibberellic Acid on Hypocotyl Growth of (Dr. B. Frankland and Prof. P. F. Wareing), 255
Lettuce Seeds: Chlorogenic Acid of (Dr. Warren L. Butler), 856
Leucocyte: Porphyrin Biosynthesis in the (B. Cullity and Prof. A. Vannotti), 187

Leucocytes (Adult Fowl) : Chorioallantoic Membrane Lesions produced by Inoculation of (Dr. Georgiana Boyer), 327
Leukaemia (Systemic) (*L1210*) : Immunity of Mice surviving, to Antifolic Resistant Variants of the Disease (Dr Abraham Goldin, Stewart R. Humphreys, Gerald O Chapman, Dr. Michael A. Chirigos and John M Venditti), 219
Leutscher, Alfred : *Obituary* of Cyril L. Collenette, 211
Level (Plasma-) of Chloride : Variations in the, in Hatchery-reared Yearling Atlantic Salmon during Parr–Smolt Transformation and following Transfer into Sea-Water (Prof Arthur H Houston), 632
Levels of Serotonin and Norepinephrine in the Brain : Reserpine and the (H. Sheppard and J H Zimmerman), 40
Leverhulme Trust : Analysis of Grants, 1932-1955, Second Report, 659
Levine, Dr Philip, and others : Haemolytic Disease of the Newborn probably due to Anti-f, 188
Levy, Martin R : Effect of Ultrasonic Insonation on the Carbon Tetrachloride–Water–Dissolved Helium System, 159
Lewis, A V. (Jones, L. H., and) . Weathering of Fly Ash, 404
Lewis, Dr D. T : Appointed Government Chemist, 889 ; work of, 889
Lewis, E. D : The Rhondda Valleys—a Study of Industrial Development, 1800 to the Present Day, *review* by Prof L Dudley Stamp, 415
Lewis, P. R., and McCutcheon, Dr C. W. : Lubrication of Mammalian Joints, 920
Leydig Cells in the Human Testicle · Relation of, to the Tubules and Testicular Function (J B. W. Halley), 865
Liable to Error . Fitting *ν* Linear Relations to *n* Variables all (M. H. Hey and E. N. Hey), 338
Library, National Central : Forty-third Annual Report of the Executive Committee (1958-59), 431
Library (School) : Science Books for a (Science Masters' Association), new edition, 814
Library Service in Great Britain, 812
Library Services (Hospital), a Pilot Survey (King Edward's Hospital Fund for London), 589
Liddell, Prof. E G. T. : Retirement from the Waynflete chair of physiology in the University of Oxford, 733 , work of, 733
Liebig Museum : Fortieth Anniversary of the, 813
Liebscher, K., and others : Radioactive Fission Products in Lungs, 192
Liepmann, Kate : Apprenticeship, an Enquiry into its Adequacy under Modern Conditions, *review*, 566
Life (The Freshwater), of the British Isles (John Clegg), second edition, *review* by Dr. W. J. Rees, 801
Life-Cycle of *Fasciola hepatica* : Elucidation of the (H S. Jefferies), 331 ; (Dr. Ben Dawes), 331
Life-Cycle of *Schizosaccharomyces octosporus* · Study of, by means of Ultra-thin Sectioning and Electron Microscopy (S. F. Conti and Prof. H. B. Naylor), 633
Life-Time of the Atomic Oxygen 6300 A. Line in the Auroral Spectrum (W. Stoffregen and H Derblom), 28
Light · Emission and Absorption of, behind the Detonation Front (Prof. C H. Johansson and T. Sjolin), 523
Light (Ultra-violet) · Effect of, on the Shape and Size of Deoxyribonucleic Acid (Dr. P. Alexander and Dr. H. Moroson), 678
  Nocturnal Detection of Tsetse Flies in Nigeria with (W. McDonald), 867
Light Alloys in Structural Engineering : Research Scholarship in the Use of (Institution of Structural Engineers and the Aluminium Development Association), 356
Light Traps (Bait and) · Physiological Age of Codling Moth Females (*Cydia pomonella* L) caught in (P. W. Geier), 709
Light and Electron Microscopy : Co-ordination of (Royal Microscopical Society and the Electron Microscopy Group of the Institute of Physics Discussion on), 660
Lightning Formation (Ball) : A Theory of (Prof. W. K. R. Watson), 449
Lignoceric Acid ($1\text{-}^{14}C$), in the Rat : Metabolism of (Dr. S Gatt and Dr. B. Shapiro), 461
Lillegraven, A., and others : Fall-out over Norway from High-Yield Nuclear Explosions, 805
Lim, D. (Wichterle, Prof. O , and) : Hydrophilic Gels for Biological Use, 117
Lindauer, Dr Martin : Elected a member of the Zoology Section of the Leopoldina Academy of Sciences, 506
Lindberg, L., and others : Experiments with Plasma Rings, 452
Lindop, Dr. Patricia J., and Roblat, Prof. J. : Protection against Acute Effects of Radiation by Hypoxia, 593
ν Linear Relations : Fitting, to *n* Variables all Liable to Error (M. H. Hey and E. N. Hey), 338
Lingcod Liver Oil : A Substance in, which prevents Hypercholesterolaemia in Cholesterol-fed Chickens (J. D. Wood and Jacob Biely), 473
Linked (Energy-) Reduction of Mitochondrial Pyridine Nucleotide (Prof. Britton Chance and Dr. Gunnar Hollunger), 666
Linnell, Prof. W. H. : *Obituary* of Prof. P. Lebeau, 429
Linnett, Dr J W., and others : Second Explosion Limit of Dried Carbon Monoxide–Oxygen Mixtures, 606
Linoleic Acid : The Stereo-Configuration of 2,4-Decadienols isolated from Oils containing (G. Hoffman and J. G. Keppler), 310
Linssen, E. F. : Beetles of the British Isles, *review* by R. T. Thompson, 721
Linstead, Sir Patrick : Appointed a vice-president of the Royal Society, 74
  Appointed chairman of the Science Advisory Committee of the British Council and a member of the Executive Committee, 286
Liotier, J. P. : Uso [illegible]iquified Petroleum Gases (Uses of 'L.P.G.' in Industry in France, with particular reference to the Metallurgical and Ceramics Industries), 580
Lipase (Adipose Tissue Lipoprotein) : Significance of (Dr. J. Páv and Dr. J. Wenkeová), 926
Lipid Metabolism : Carnitine in (E. P. Adams, P. E Ballance and A. E. Bender), 612
Lipid Peroxidation in Microsomes : Inhibition of, by Vitamin E (Dr. A. L. Tappel and Dr. H. Zalkin), 35
Lipidosis (Cholesterosis and), of Rats maintained on an Atherogenic Diet : Modification of (Dr. N. R. Di Luzio), 616
Lipids (Chloroplast) : Hydrogenation of, by Rumen Bacteria (Dr D. E. Wright), 546
Lipoamino-Acids—the Question of Artefact (Dr. J. J. Wren), 295
Lipoprotein Lipase (Adipose Tissue) : Significance of (Dr. J. Páv and Dr J. Wenkeová), 926
Lipsey, Dr R G. · Appointed to the University of London readership in economics at the London School of Economics and Political Science, 433
Liquid Concentration in Flow Studies with Porous Models : Optical Scanning of (Dr E R. Deutsch), 6[illegible]5
Liquid Two-Phase Systems : Antigen–Antibody in—a Method for Studying Immunological Reactions (Per-Åke Albertsson and Lennart Philipson), 38
Liquid–Gas Chromatography : Separation of the Hypnotic Potentiating Principles from the Essential Oil of *Acorus calamus* L. of Indian Origin by (Ross M. Baxter, P. C. Dandiya, S I. Kandel, A Okany and Prof. G C Walker), 466
Liquides organiques : Radiolyse de (Milton Bruton), *review* by Dr. W. Anderson, 202
Liquids : Thermo-magnetic Effects in (R. C Saxena, J. N Tandon and S P. Talwar), 158
Liquids (Monatomic) : Geometry of the Structure of (Prof. J. D Bernal), 68
Liquified Petroleum Gases : Uses of (Institute of Fuel Symposium on), 580
Literature and Science (Dr. D. G. James), 289
Lithium-Ethylenediamine . Reduction of Graphite by (Raphael Raymond, Leslie Reggel, Waldo A Steiner, Sabri Ergun and Irving Wender), 379
Lithium Methoxide : Structure of (P J. Wheatley), 681
Lithium (Calcium–) Competition in Absorption by Plant Roots (Emanuel Epstein), 705
Litovitz, Theodore A (Herzfeld, Karl F., and) : Absorption and Dispersion of Ultrasonic Waves, *review* by Prof. E. G Richardson, 3
Little, Inc., Arthur D. : Industrial Bulletin 369, Basic Research in the Navy. 588
Little, R., and others : Microwave Spectrum of Fluorine Cyanide, 96
Littlewood, William . Appointed deputy science officer at the United States Embassy in Stockholm, 657
Littorina saxatilis (Olivi) : A New Cercaria of the Subfamily Gymnophallinae (Trematoda : Digenea) developing in a Unique 'Parthenita' in (B. L. James), 181
Live Whale · Physiological Examination of a (Dr. John W. Kanwisher and Dr. Alfred W. Senft), 13
Liver : Rare-Earth Fatty (Dr. Fred Snyder, Edgar A. Cress and Granvil C. Kyker), 480
Liver (Cirrhotic) : Fibrinolytic Activity of (Dr. Tage Astrup, J. Rasmussen, A. Amery and H. E. Poulsen), 619
Liver (Isolated Perfused Rat) : Glucagon, a Protein Catabolic Hormone in the (Prof. Leon L. Miller), 248
Liver Damage : A Hepatotoxin causing, in Facial Eczema of Sheep (Dr. N. A Worker), 909
Liver Fat (Foetal), in the Rabbit : Effect of Foetal Hypophysectomy on the (Dr. J G. Bearn), 849
Liver Homogenates (Turkey) · Isolation of Radioactive Vitamin B_{12} from Incubation Mixtures containing Glycine-2-^{14}C and (Pran Vohra and F. H Kratzer), 45
Liver Injury : Effect of Antihistamines on Mitochondrial Swelling and (Dr. J D. Judah), 390
Liver Necrosis (Dietary) : Intracellular Potassium in (A. E. M. McLean), 936
  'Phenergan' and Versene in (A. E. M. McLean), 191
Liver Oil (Lingcod): A Substance in, which prevents Hypercholesterolaemia in Cholesterol-fed Chickens (J. D. Wood and Jacob Biely), 473
Liver Phosphatidyl Inositol Configuration of Inositol Phosphate in (Dr. J N. Hawthorne, P. Kemp and R. B. Ellis), 37
Liverpool Geological Society : Medal of the Society presented to Dr. J. C. Harper, 14
  Centenary Celebrations, 213
Living Molluscs : Manganese Deposition on the Shells of (Dr. J. A. Allen), 336
Livingston, Prof. R. L., and others : Molecular Structure of Neopentane, 458
Livingstone Centenary Medal of the American Geographical Society awarded to William E. Rudolph, 12
Llewellyn, Dr. F. B. : *Obituary* of Dr. Oliver E. Buckley, 655
Lloyd, J. L , and others : Momentum Spectrum of Cosmic Rays at Sea Level, 364
Loasby, G. : Resignation as chairman of the Council of the Textile Institute, 14
Local Gamma-Ray Background : Increases in the, due to Nuclear Bomb Fall-out (J. Vennart), 722
Localization (Histochemical), of Oxidase Activity in the Mitochondria of the Heart in some Lower Vertebrates (Prof. A. Stolk), 866
Lochte, jun., Harry L., and others : *In vitro* Synthesis of Foetal and Adult Haemoglobin by Foetal Haematopoietic Tissues, 396
Lock, Dr J. A., and others : Control of African Wild Animals, 47
Lockett, H : The Science Masters' Association, 288
Lockwood, G. E. K., and others : Observed Characteristics of an Ultra-High-Frequency Signal Traversing an Auroral Disturbance, 510
Locust (Desert) . Fertilization of Eggs of the, by Spermatozoa from Successive Copulations (Philip Hunter-Jones), 336
  Time of Feeding in relation to the Toxicity of a Stomach Poison to the (R. D. MacCuaig and W. S. Watts), 335
Lodge, Patricia D. B., and Smith, Dr. C. L. : Hormonal Control of Secretion in the Oviduct of the Amphibia, 774
Loebel, F., and others : Cementing Substances in Metastasizing and Non-Metastasizing Transplantable Tumours in Mice, 864
Loebenstein, Dr. G. : Native Protein, an Immunizing Agent against Virus Infection, 122
Loebner, E. E. : Dielectric Devices (Gain-bandwidth Limitations of Currently available Luminescence Amplifiers), 360
Logan, Sir Douglas : Appointed a member of the Commonwealth Scholarship Committee in the United Kingdom, 505
Logemann, Dr. W., and others : Methanesulphonic Acid Derivatives of Central Stimulant Drugs, 532
Loggerhead Turtle Interaction between the Plasma of the, and Toxin of the Portuguese Man-of-War (Dr. Eleanor Dodge Wangersky and Prof Charles E. Lane), 330
Logic (Symbolic), Association for (American Mathematical Society and the) : Symposium on Basic Questions in the Structure of Languages, 215
Logie, Dr. C. Loren, and others : The Shuttle-Box Behaviour of Albino Rats during Prolonged Exposure [illegible] Moderate-Level Radiation, 665
Lombricine : Biosynthesis of (Dr. R. J. Rossiter, Dr. T. Gaffney, Dr. H. Rosenberg and Prof. A. H. Ennor), 383

Lomer, W. M. : Theory and Applications of Nuclear Induction, *review*, 67
London, Dr. H. Generation of Temperatures below 1° K. (More Abstruse Techniques), 349
London School of Economics and Political Science : Research Methodology at the (Prof. M. G. Kendall), 208*
  Title of professor of economics in the University of London conferred on B. S. Yamey, 214
  Appointment of Dr. R. G. Lipsey to the University of London readership in economics, 433
  Title of reader in economics in the University of London conferred on Dr. K. J Lancaster, 433
  Appointment of P. T. Bauer to the University of London chair of economics (with special reference to under-developed countries and economic development), 737
London and Home Counties Regional Advisory Council for Technological Education : Bulletin on Courses in Advanced Technology, 506
Long, Dr. G. (Dawson, Dr. J. K., and) : Chemistry of Nuclear Power, *review* by Prof W. Murgatroyd, 4
Long, Hazel A , and others : Effect of Small Doses of Alcohol on a Skill resembling Driving, 354
Long, Dr. L. E., and others : Potassium–Argon and Rubidium–Strontium Ages of some Granites from Britain and Eire, 495
Long Ashton Research Station (Dr. John Grainger), 743
Lonsdale, Dame Kathleen (edited by John S. Kasper and) : International Tables for X-Ray Crystallography, Vol. 2, Mathematical Tables, *review* by Dr. A R. Stokes, 129
Lontie, R (Heirwegh, K., and) · Decrease of the Copper Bands of *Helix pomatia* Haemocyanin, 853
Lord, R. D : Elected a Fellow of the Royal Society of Edinburgh, 734
Lords, House of . Second reading of the Marshall Scholarships Bill, 271
  Second reading of the Public Health Laboratory Service Bill, 505
  Debate on Science in Civil Life, 583
Loss of Gravitational Potential Energy : An Expanding Earth with (Prof. A. E. Beck), 677
Loss of Heat by Evaporation in Young Lambs (G. Alexander and A. H. Brook), 770
Loss of Photoreversibility of Ultra-violet-induced Mutations : Correlation of, with Deoxyribonucleic Acid Synthesis (Dr. F. L. Haas and Dr. C. O. Doudney), 637
Lossing, P , and McDowell, Prof. C. A : A Proposal for the Nomenclature of Free Radicals, 161
Love, Dr A : At the meeting of the Flora Europaea Organization in Vienna (Taxonomy of Apomicts), 15 ; (Taxonomy and Chromosomes—a Reiteration), 17
Love, R M : Water Content of Cod (*Gadus callarius* L.) Muscle, 692
Lovern, Dr. J. A. : Elected a Fellow of the Royal Society of Edinburgh, 734
Low, J. J., and others : Gallium Arsenide Tunnel Diodes, 676
Low-Dose Neutron Exposure : Conditioned Avoidance Behaviour induced by (Dr. John Garcia and Dr. Donald J. Kimeldorf), 261
Low-Energy Cosmic-Rays : Solar Radio Bursts and (Dr. A. R. Thompson and Dr. A Maxwell), 89
Low-Energy X-Rays from Interplanetary Space (Dr. L. Reiffel), 229
Low External Potassium Concentrations : Resting Potentials in Isolated Frog Sartorius Fibres at (Dr. Roderick P. Kernan), 471
Low Hydrodynamic Shear : Sedimentation of Deoxyribonucleic Acid isolated under (Dr. P. F. Davison), 918
Low Molecular Weight Organic Base from the Dinoflagellate *Amphidinium carteri* (Peter J. Wangersky and Robert R. L. Guillard), 689
Low Temperatures of the Environment : Reaction of Hibernators to various (Dr. Zdenek Bartoš), 251
Lowe, Dr. C. R. : A readership in social medicine in the University of Birmingham conferred on, 892
Lowenstein, Prof O., and Wersall, J. : A Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* in Terms of Directional Sensitivity, *errata*, 76
Lower Olefines : Industrial Chemistry of the (Chemical Society, the Institute of Petroleum, the Royal Institute of Chemistry and the Society of Chemical Industry Symposium on), 660
Lower Vertebrates : Histochemical Localization of Oxidase Activity in the Mitochondria of the Heart in some (Prof. A. Stolk), 866
Lowy, Dr. Peter H., and others : Inactivation of Erythropoietin by Neuraminidase and by Mild Substitution Reactions, 102
Lubricants : Lubrication and (Borough Polytechnic, London, Course of Lectures on), 286
Lubrication of Mammalian Joints (Prof. M. A. MacConaill), 920 ; (P. R. Lewis and Dr. C. W. McCutcheon), 920
Lubrication and Lubricants (Borough Polytechnic, London, Course of Lectures on), 286
Lubszynski, H G : Dielectric Devices (Use of an Electron Beam for making Contact to a Semi-conductor), 360
Lucas, J. M. S., and others : 3:3'-Diamidinocarbanilide, a New Drug Active against Babesial Infections, 461
Lucas Heights Research Establishment of the Australian Atomic Energy Commission : Appointment of Dr G. C. J. Dalton as director, 889
  Installation of a second Nuclear Reactor, 889
Luig, N. H : Differential Transmission of Gametes in Wheat, 636
Lunar Surface : The, *review* by Dr. B. E. J. Pagel, 718
Lund, Dr. Erling, and others : Dietary Fats and Thrombosis, 330
Lundegardh, Prof. H : Salts and Respiration, 70
Lung-Fish (*Protopterus*) . Action of Thryoxine on the Rate of Oxygen Consumption of the (Dr. T. Mohsen and Dr. R. Godet), 108
Lungs : Radioactive Fission Products in (Dr. T. Schonfeld, K. Liebscher, F. Karl and Christina Friedmann), 192
Lungworm *Cystocaulus ocreatus* : The Field-Slug *Agriolimax reticulatus* as a Vector of the (Dr. J. H. Rose), 180
Lungworm *Protostrongylus rufescens* in Australia (A. Korthals and G. Shenman), 941
Lunik II : Observations related to the Impact of (G. Fielder), 11
Lupton, Dr. T. : Appointed head of the Department of Industrial Administration of the Birmingham College of Advanced Technology, 430 ; work of, 430
Lurie, C., and others : Molecular Structure of Neopentane, 458
Luscombe, Mollie : Decrease in Coenzyme 1 Content of Spleen after Freezing, 691
Luteinizing Hormone . Assaying (Dr. F. A. Soliman), 321
Lyell Fund (a moiety of the) of the Geological Society of London awarded to Dr. J. D. Lawson and one to Dr. R. H. Cummings, 657
Lyell Medal of the Geological Society of London awarded to Dr. Doris Reynolds, 657
Lynds, Beverly, and others : Elementary Astronomy, *review* by Dr. R. H. Garstang, 130
Lyne, A G., and others : Formation of New Wool Follicles in the Adult Sheep, 51
Lyon, Dr. R. J. P., and Tuddenham, Dr. W. M. : Determination of Tetrahedral Aluminium in Mica by Infra-Red Absorption Analysis, 374
  Infra-Red Determination of the Kaolin Group Minerals, 835
Lyons, B. J : Effect of High-Energy Radiation on Mixtures of Vinyl or related Polymers with Unsaturated Compounds, 604
Lysis (Clot) : Mechanism of (Prof. N. K. Sarkar), 624

McCALLUM, G. H., and others : Crystal Structure of L-Serine Phosphate, *errata*, 14
McCallum, Prof K. J. (Specken, G. A., and) Recrystallization of Amorphous Copper Sulphate Monohydrate, 758
McCance, Prof R. A. : Scientific Medicine for Postgraduates, *review*, 202
McCance, Prof. R. A., and the Department of Experimental Medicine, Cambridge : Course on the Clinical Aspects of Nutrition, 507
McClure, T. J. Use of Chorionic Gonadotropin to prevent Early Embryonic Mortality in Temporarily Fasted Mice, 622
MacConaill, Prof. M. A. : Lubrication of Mammalian Joints, 920
McCoubrey, A., and others . Powerful Adrenergic Neurone-blocking Agents related to Choline 2,6-Xylyl Ether Bromide, 925
McCrone Associates of the United States : National Microscopy Symposium, 146
MacCuaig, R. D., and Watts, W. S. : Time of Feeding in relation to the Toxicity of a Stomach Poison to the Desert Locust, 335
McCutcheon, Dr. C. W. (Lewis, P. R., and) : Lubrication of Mammalian Joints, 920
Macdonald, Prof. A. D : Appointed Officier de l'Ordre de la Santé Publique by the French Minister of Health, 356
Macdonald, Dr. D. K. C. · Electron–Phonon Interactions in Solids (Experimental Investigations of Thermo-electric Effects in Metals and Semiconductors), 586
MacDonald, Dr. G. J. F. (Munk, Prof W., and) · The book 'The Rotation of the Earth' awarded the Monograph Prize of 1959 of the American Academy of Arts and Sciences, 660
Macdonald, J. D. . La Vie des Colibris—les Trochilidés, *review*, 67
  Bird Watching for Beginners, *review*, 415
MacDonald, Dr R. E., and others : Permeability of Dormant Bacterial Spores, 782
McDonald, W : Nocturnal Detection of Tsetse Flies in Nigeria with Ultra-Violet Light, 867
McDowell, Prof C. A. (Lossing, F. P., and) : A Proposal for the Nomenclature of Free Radicals, 161
McDowell, Prof. C. A. (Matsunaga, Dr. Y., and) : Electron Spin Resonance Absorption of the Biradical Molecular Complex, *p*-Phenylenediamine-chloranil, 916
MacEwan, Dr. D. M. C. : Elected a Fellow of the Royal Society of Edinburgh, 734
McGill University : Research by, in Barbados, 77
McGill University Tropical Research Institute, 78
MacGregor, Dr. A. G. Awarded the Murchison Medal of the Geological Society of London, 657
Mach Number (High), Air-breathing Machines (Combustion and Propulsion Panel of the Advisory Group for Aeronautical Research and Development of NATO, Colloquium on), 146
Machines : Electrical (Prof. M. G. Say), 215
Machines (Air-breathing) : High Mach Number (Combustion and Propulsion Panel of the Advisory Group for Aeronautical Research and Development of NATO, Colloquium on), 146
MacKay, Dr. D. M. · Title of reader in physics in the University of London (at King's College) conferred on, 214
  Monocular 'Rivalry' between Stabilized and Unstabilized Retinal Images, 834
McKetta, Jr , John J. (edited by Kenneth A. Kobe and) : Advances in Petroleum Chemistry and Refining, *review* by Prof. F. Morton, 201
Mackinney, Prof G , and others : Formation of Carotene *in vitro*, 687
Mackinnon, Dr. L. · Electron–Phonon Interactions in Solids, 587
Mackintosh, N. A. : The Biology of the Southern Cold Temperate Zone, 206
McLean, A. E. M. · 'Phenergan' and Versene in Dietary Liver Necrosis, 191
  Intracellular Potassium in Dietary Liver Necrosis, 936
McLean, E. K., and others : Presence of Aldosterone-stimulating Hormone in Urine, 540
McManus, M Annunciata : Certain Mitotic Effects of Kinetin, Gibberellic Acid, Indoleacetic Acid and Maleic Hydrazide on the Root of *Allium cepa*, 44
McMinn, Dr. R. M. H. : Appointed to a readership in anatomy at King's College, London, 214
McMullen, A. I. : Co-factors in *Hevea brasiliensis* Latex Serum, 103
Macpherson, Dr. Sheila, and Owen, Dr. Maureen : Radioactive Materials and the Skeleton (The Relation of Radiation Damage to Radiation Dose from Strontium-90), 807
McQuillen, Dr. Kenneth : Appointed College lecturer in biochemistry in Churchill College, Cambridge, 433
Macromolecules · Deuterium–Hydrogen Exchange between Water and—Accessibility of Cellulose (Dr. John R. Morrison), 160
Macropodia (Genus) : Swimming in Spider Crabs of the (R. G Hartnoll), 181
Macropods (Marsupial) : Delayed Birth in—the Euro, the Tammar and the Marloo (R. M. Sadleir and J. W. Shield), 335
McWeeny, Dr. R. : Appointed to a senior lectureship in theoretical chemistry in the University College of North Staffordshire, 737
Madar, J., and others : Effect of β-Hydroxybutyrate Injections on the Pancreatic Activity of Guinea Pigs and Rats, 771
Maffii, G., and Bianchi, G. : Anticholinergic Activity of Tropine-α-Methyltropate, 844
Magat, M. (Chapiro, A., et) : Polymérisations amorcées par les Radiation Ionisantes, *review* by Dr. W. Anderson, 202

Magdoff, Dr. Beatrice S. : Sub-Units in Southern Bean Mosaic Virus, 673
Magic Arc : The (Prof. H. O'Neill), 14
Magnesium Deficiency : Dietary Phytate as a Possible Cause of (Dr. A. Heulwen Roberts and Prof John Yudkin), 823
Magnesium Ions : Paradoxical Effect of, on Blood Coagulation (R. G. Huntsman, B. A. L. Hurn and Dr H. Lehmann), 852
Magnetic Dip : Variation of Electron Density in the Ionosphere with (Sheila Croom, Audrey Robbins and J. O. Thomas), 902
Magnetic Field (Earth's) : Micropulsations in the, simultaneous with Pulsating Aurora (Dr. W H. Campbell), 677
Magnetic Moment : Variation of, with Composition in the Iron–Vanadium Sigma Phase (Dr. D. Parsons), 839
Magnetic Susceptibility of some Transition Elements : Variation with Temperature of the (Dr. H. Kojima, Dr. R S. Tebble and D. E. G. Williams), 90
Magnetometer (Hall Effect) . Measurement of Ion Beam Currents using a (W S Whitlock and C. Hilsum), 302
Magnetotropism, a New Plant-Growth Response (Prof. L. J Audus), 132
Maharaj, S B. (Fenwick, Dr. D. W , and) : Presence of *Aphelenchoides cocophilus* in the Roots of *Cocos nucifera*, the Coconut Palm, 259

Manchester, Dr. K. L. . Effects of Starvation on the Ability of Isolated Rat Diaphragm [illegible] Incorporate Labelled Amino-Acids into its Protein and to Respond to the Influence of Insulin on this Process, 907
Manganese Deposition on the Shells of Living Molluscs (Dr. J A. Allen), 336
Mankind : Evolution of, 411
Mann, Jay D. (LaBrosse, Elwood H., and) : Presence of Metanephrine and Normetanephrine in Normal Human Urine, 40
Mansfield, W. W. : Preventing Evaporation from Reservoirs, 581
Manson, J. A , and others : At the Ninth Canadian High Polymer Forum (The Determination of the Breadth of Molecular Weight Distribution in Polyethylene by an Irradiation Technique), 359
Manta, J., and others : Effect of β-Hydroxybutyrate Injections on the Pancreatic Activity of Guinea Pigs and Rats, 771
Manton, Prof I : At the Conference of the Botanical Society of the British Isles to celebrate the Centenary of the publication of the 'Origin of Species' (Some Aspects of Evolution in Pteridophyta), 217
Manufacturing Industry : Training Unskilled and Semi-Skilled Operatives in (W. D. Seymour), 509
Manurial Levels : Nitrate Content of Herbage at Different (Dr. G. ap Griffith), 627
March, Beryl E. : Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 212
Marchi-Positive Bodies in Human Globus Pallidus (Dr. Marion C. Smith), 938
Marconi International Award established by Permindex, Rome, 432
Marina (*Botanica*), No. 1, 658
Marine (Merchant) · The Role of Nuclear Propulsion in our Future (Atomic Industrial Forum, the United States Atomic Energy Commission and the Maritime Administration Conference on), 582
Marine Molluscs (Tropical), from America, *review* by I. C J. Galbraith, 275
Marine Organisms : Influence of Filming and of Surface Texture on the Settlement of (Dr D. J Crisp and J. S Ryland), 119
Maritime Administration, and others : Conference on the Role of Nuclear Propulsion in our Future Merchant Marine, 582
Market Strategy and Economic Survival, *review* by Prof. R. G. D. Allen, 645
Market Structure · Strategy and (Dr. Martin Shubik), *review* by Prof. R. G. D. Allen, 645
Marketing Societies (Horticultural Co-operative) . Working Party on (To be set up by the Minister of Agriculture, Fisheries and Food), 736
Markham, E., and others : Formation of I- and III-Type Porphyrins by the Polymerization of Pyrroles, 607
Marloo : Delayed Birth in Marsupial Macropods—the Euro, the Tammar and the (R. M. Sadleir and J. W Shield), 335
Marr, A G. M., and Gilbo, C M. · Serum Chromatography on Columns connected to a Common Source of Buffer Gradients, 853
Marrow Flecks (Bone) · Effect of Amethopterin and 6-Mercaptopurine on the Pattern of Oxygen Tension Measurements in the Fluid Phase of Serum Agar Cultures of (Dr H. J Woodliff and J. M G Davis), 477
Marshall, Dr A. J · Appointed to the chair of biology in the University of Monash, Melbourne, 286, 734 , work of, 734
  Cyclical Activity in Endocrine Systems, 663
Marshall, Dr. Royal R Calculation of Cosmic-Ray Ages in the Iron Meteorites 'Carbo' and Treysa', 89
Marshall Scholarships Bill · Second reading in the House of Commons, 271 ; second reading in the House of Lords, 271
Marsupial · Effect of Inorganic Sulphate on Molybdenum Excretion by a (Shelley Barker), 41
Marsupial Macropods : Delayed Birth in—the Euro, the Tammar and the Marloo (R. M. Sadleir and J. W. Shield), 335
Martin, Ariane, et Musy, Anne · La Vie des Colibris—les Trochilidés, *review* by J. D Macdonald, 67
Martin, Dr. D. C : Tercentenary Celebrations of the Royal Society, 879
Martin, H. A., and Priester, Dr W. : Measurement of Solar and Diurnal Effects of the High Atmosphere by Artificial Satellites, 600
Martinet, J. (Denamur, R , and) · Physiological Mechanisms concerned in the Maintenance of Lactation in the Goat and Sheep, 252
Martini, Prof. Paul : Elected a member of the Internal Medicine Section of the Leopoldina Academy of Sciences, 506
Martinovitch, Dr. P. N., and Pavić, D. : Functional Pituitary Transplants in Rats, 155
Martius, U., and others · At the Ninth Canadian High Polymer Forum (The Polymerization of I-Butene by Metal Alkyl–Titanium Halide Catalysts), 359
Martlew, D. L. : Aerodynamic Capture of Particles (Impingement of Water Drops on Turbine Blades), 665
Mascall, Rev. Dr E. L. : Chance and Providence, *review*, 875
Maser (Ammonia) : Measurements of the Frequency of an, in England and Australia (A. M. J. Mitchell and E. Sandbach), 833
Masevich, Prof. A. : Lectures on the Conquest of Space, 286
Mason, Dr. Revil : Prehistory of Southern Rhodesia, *review*, 65
Mass (Electron) . Ratio of Nucleon Mass and (Dr. R. L. Worrall), 602
Mass (Nucleon), and Electron Mass : Ratio of (Dr. R. L. Worrall), 602
Mass Rearing of Barnacle Cyprids in the Laboratory (John Moyse), 120
Masson, C. R. (Pearce, M L , and) : Determination of Oxygen in Iron and Steel, 373
Mast Cells : Histochemical Demonstration of a Species-Specific Trypsin-like Enzyme in (G. G. Glenner and L. A Cohen), 846
Mastropietro-Cancellieri, Maria Francesca, and others : Incorporation of α,ω-Dicarboxylic Acids as Side-Chains into the Penicillin Molecule, 97
Materials : Important Raw, *review* by Dr. F. Lyth Hudson, 646
  Non-Metallic Brittle, *review* by Dr. David Train, 344
Materials (Biological) : A Simple Test for the Presence of Metals in (Dr. C. Milstein), 386
Materials (Non-Metallic Brittle) Mechanical Properties of (edited by W H. Walton), (Proceedings of a Conference on Non-Metallic Brittle Materials, organized by the Mining Research Establishment of the National Coal Board in consultation with the Building Research Station (D.S.I R.), London, 1958), *review* by Dr. David Train, 344
Materials (Radioactive), and the Skeleton (Bone and Tooth Society Conference on), 807
Mathematical Association of America : Chauvenet Prize awarded to Prof. Cornelius Lanczos, 146
Mathematical Methods of Operations Research (Thomas L. Saaty), *review* by Prof. L. S. Goddard, *erratum*, 433
Mathematical Society, American : Symposium on Stability Problems in Hydrodynamics, 215
Mathematical Society (American), and the Association for Symbolic Logic : Symposium on Basic Questions in the Structure of Languages, 215
Mathematical Tables (International Tables for X-Ray Crystallography, edited by John S. Kasper and Dame Kathleen Lonsdale, Vol. 2), *review* by Dr. A. R. Stokes, 129
Mathematiche : Discorsi e Dimostrazioni, intorno a due Nuove Scienze (Galileo Galilei), (a cura di Adriano Carugo e Ludovico Geymonat), *review* by L. Roth, 717
Mathematics : Crystallographer's Tool-Chest of, *review* by Dr. A. R. Stokes, 129
Mathematics and Children (Z. P. Dienes), 581
Mathematics and Operations Research, *review* by Prof. L. S. Goddard, *erratum*, 433
Mathematics and Science Teachers in Great Britain, 812
Matheson, Prof. J. A. L. : Appointed vice-chancellor of the University of Monash, Melbourne, 212 ; work of, 212
Mathot, Guy : Les Papillons, *review* by Paul E. S. Whalley, 800

Mellanby, Dr. Kenneth . Post-Mortem on Groundnuts?, *review*, 564
Mellitic Acid : Crystal Structure of (Dr. A. Bezjak and Prof. D. Grdenić), 756
Melting Point : Decomposition of Uranium Dioxide at its (Dr J. S. Anderson, J O. Sawyer, Prof. H. W. Worner, G M. Willis and M. J. Bannister), 915
Melville, Sir Harry : To open the new Laboratories of the Coil Spring Federation Research Organization, 660
Membrane (Cell), of *Escherichia coli* : Damage by Streptomycin to the (Effect of Streptomycin on *Escherichia coli*), (Nitya Anand and Dr. Bernard D Davis), 22
Membrane (The Nuclear), as a Barrier to the Free Diffusion of Proteins (Carl M. Feldherr and Ailene B. Feldherr), 250
Membrane Lesions (Chorioallantoic), produced by Inoculation of Adult Fowl Leucocytes (Dr. Georgiana Boyer), 327
Membrane Preparations (Spheroplast) · Antigens of, from *Escherichia coli* B (Dr T. Holme, A.-S. Malmborg and E. Cota-Robles), 57
Membrane Transport (Selective Biological), of Individual Amino-Acids (Dr. S. M. Hardy), 245
Membranes (Cytoplasmic) : Ionic Exchange and the Structure and Function, including Motility, of (Dr W. E. Hutton), 439
Men (Ape-) : Excavating (Dr. J. T. Robinson), 214
Mendelssohn, Dr. K. : Generation of Temperatures below 1°K. (Use of Adiabatic Magnetization of a Superconductor for obtaining Temperatures of a few tenths of a Degree), 349
  Electron–Phonon Interactions in Solids, 586
Mendoza, Dr. E. : Generation of Temperatures below 1°K. (Principles and Techniques of the Adiabatic Demagnetization Method), 349
6-Mercaptopurine : Effect of Amethopterin and, on the Pattern of Oxygen Tension Measurements in the Fluid Phase of Serum Agar Cultures of Bone Marrow Flecks (Dr. H J. Woodliff and J. M. G. Davis), 477
  Inhibition of the Inductive Phase of Antibody Formation by, examined by the Transfer of Isolated Cells (Dr. J. Sterzl), 256
Mercer, Dr. E H. . Awarded a Royal Society and Nuffield Foundation Commonwealth Bursary, 212
Merchant Marine : The Role of Nuclear Propulsion in our Future (Atomic Industrial Forum, the United States Atomic Energy Commission and the Maritime Administration Conference on), 582
Mercuric Chloride . Ultrasonic Velocities in Aqueous Solutions of Cadmium Iodide and (S. V. Subrahmanyam), 371
Mercury Electrode (Dropping) : Influence of Nitrogen-containing Bases on the Rate of the Electrode Processes at the (V. Volková), 743
Meridional Reflexions in the X-Ray Diffraction Photographs of α-Keratin (W. J Onions, H. J. Woods and P. B. Woods), 157
Meridional Reflexions (High-Spacing), in the X-Ray Photograph of Keratin impregnated with Heavy-Metal Salts : Enhancement of the (W. S. Simpson and H. J. Woods), 157
Merrison, Dr A. W. : Appointed to the chair of physics in the University of Liverpool, 284 , work of, 284
Merz, W. J. : Dielectric Devices (Ferro-electricity), 361
Merxmuller, Prof. H. : At the meeting of the Flora Europaea Organization in Vienna (Taxonomy of Apomicts), 15 ; (Problems of Geographical Distribution and Taxonomy), 16
Meschkat, Dr. A. W. . Appointed regional fisheries officer for Africa of the Food and Agriculture Organization of the United Nations, 356
Messel Medal of the Society of Chemical Industry awarded to Viscount Chandos, 433
Metabolism : α, ε-Diaminopimelic Acid—its Distribution, Synthesis and (Dr. L. E. Rhuland), 224
Metabolism of Bemegride labelled with Carbon-14 (P. J. Nicholls), 927
Metabolism of 1-^{14}C Lignoceric Acid in the Rat (Dr. S. Gatt and Dr. B. Shapiro), 461
Metabolism of Polypores with Phosphorus-32 (Prof. S. R. Bose and P. Bonet-Maury), 828
Metabolism (Glucose), of Chicken Embryo Fibroblasts : Effect of Kinetin on (Dr. S. Halevy and Lydia Avivi), 388
Metabolism (Glucose), in Human Pancreatic β-Cells : Evidence for the Hexose Monophosphate Pathway for the (Dr J[illegible]es B. Field, Phyllis Johnson, Betty Herring and Arnold N Weinberg), 468
Metabolism (Intermediary), of Nitrobenzoic Acids by Bacteria (R. B. Cain and N. J. Cartwright), 868
Metabolism (Lipid) . Carnitine in (E. P. Adams, P. E. Ballance and A. E. Bender), 612
Metabolism (Nitrogen), in Plants (Prof. George C. Webster), *review* by Dr. G. Bond, 415
Metabolism (Nucleic Acid), and the Initiation of Zygospores of *Rhizopus sexualis* : A Possible Relationship between (P. M. Hepden and Dr. B F. Folkes), 254
Metabolism (Proline and Hydroxyproline) : Some Interrelated Aspects of (Georg B. Gerber, Gisela Gerber and Kurt I. Altman), 767
Metabolism (Radiophosphorus), in Salmon : Thyroidal Control of (P. N. Srivastava), 621
Metabolism (Tissue), *in vitro* : Effect of Chlorpromazine on (Dr. J. Kozák, Dr. A. Zeleny and N. Lang), 107

Metabolite (A New), of Chloramphenicol (W. A. Dill, E. M. Thompson, R. A. Fisken and A. J. Glazko), 535
Metal Fatigue : A Model of (Dr A. N. May), 303
Metal Finishing, Institute of . Annual Spring Conference, 356
Metal Ions : Fungitoxicity of (Dr. Lawrence P. Miller), 545
Metal Mining Association, United Kingdom (Institution of Mining and Metallurgy and the) : Proceedings of a Symposium on the Future of Non-Ferrous Mining in Great Britain and Ireland (1958), *review* by Prof. K. C. Dunham, 801
Metal Salts : Metal-Organic Complexes formed during the Treatment of Wood with (C. H. Bayley and Grace R. F. Rose), 313
Metal Surfaces (Oxide-coated) : Exo-electron Emission and the Optical Properties of (J. A. Ramsey), 602
Metal-Organic Complexes formed during the Treatment of Wood with Metal Salts (C. H Bayley and Grace R. F. Rose), 313
Metallic Structures : Distortions in (Dr J. Graham), 29
Metallurgist, The, No. 1 (Institution of Metallurgists), 813
Metallurgists, Institution of : *The Metallurgist*, No. 1, 813
Metals : Corrosion Inhibition and the Zero Charge Potential of (Dora M. Brasher), 828
  Interstitials and Fracture of (Dr. T. E. Scott and Dr. A. R Troiano), 372
  Purification of, by Gas Chromatography (Dr. F. E. DeBoer), 915
Metals, Institute of : Platinum Medal for 1960 awarded to Prof. Robert Franklin Mehl, 735
  Rosenhain Medal for 1960 awarded to Prof. Norman James Petch, 735
  W. H. A. Robertson Medal and Premium for 1959 awarded jointly to Dr. Maurice Cook and E. Swainson, 735
Metals in Biological Materials : A Simple Test for the Presence of (Dr. C. Milstein), 386
Metals (Platinum) : Phosphides of the (Stig Rundqvist), 31
Metanephrine in Phaeochromocytoma Tissue . Presence of 3-Methoxy-4-hydroxyphenylglycol and (Dr. Irwin J. Kopin and Dr. Julius Axelrod), 788
Metanephrine and Normetanephrine : Presence of, in Normal Human Urine (Elwood H. LaBrosse and Jay D. Mann), 40
Metastasizing and Non-Metastasizing Transplantable Tumours in Mice : Cementing Substances in (G. Gasić, L. Loebel and O. Badínez), 864
Meteorites in Space : Erosion of, and the Density of Interplanetary Gas (Dr. L. Reiffel), 821
Meteorites (Iron), 'Carbo' and 'Treysa' Calculation of Cosmic-Ray Ages in the (Dr H. Voshage and Dr. H. Hintenberger), 88 ; (Dr. Royal R. Marshall), 89
Meteorological Department (Indian) : Retirement of Shri S. Basu as director-general of observatories, 811
  Appointment of Shri P. R. Krishna Rao as director-general of observatories, 812
Meteorological Office : Scales of Temperature in the, 736
  High-Atmosphere Research in the, 814
  Gassiot Research Fellowships in Geomagnetism and Seismology, 892
Meteorological Organization, World : Conferences and Symposia in 1960, 76
Meteorology for Geographers, *review* by G. A. Bull, 720
Meteorology (Agricultural) : Third Symposium on Aspects of (Upland Climate and Land Usage, with special reference to Highland Britain), (University College, Aberystwyth), 737
Methanesulphonic Acid Derivatives of Central Stimulant Drugs (Dr. W. Logemann, F. Laurta and D. Artini), 532
Method : A Proposal to replace Belief by, in the Pre-mensural Sciences (C. C. L. Gregory), 124
Method of Controlling the Temperature of Insect Neurosecretory Cells *in situ* (R. H. J. Brown and Janet E. Harker), 392
Method of Roth and Schuster : Spectrophotometric Determination of Tryptophan by the—some Sources of Error (Ivan Larsen), 316
Method for Studying Immunological Reactions : Antigen–Antibody in Liquid Two-Phase Systems—a (Per-Åke Albertsson and Lennart Philipson), 38
Method of Tissue Preparation : Effects of the, on the Assay of Tissue Enzyme Activities (Dr Sjoerd Bonting and Ira M. Rosenthal), 686
Method (A Synergic), of Carrying out Continuous Electrochromatography (Dr. S R. Caplan), 378
Methodology (Research), at the London School of Economics (Prof. M. G. Kendall), 208
Methods : Micro- and Semi-microchemical (Norwood Technical College, London, Course on), 737
Methods of Biochemical Analysis (edited by Prof. David Glick), Vol. 7, *review* by Dr. D. T. Elmore, 797
Methods (Geochemical), of Prospecting and Exploration for Petroleum and Natural Gas (A. A. Kartsev, Z. A. Tabasaranskii, M. I. Subbota and G. A. Mogilevskii), English translation edited by Paul A. Witherspoon and William D. Romey, *review* by Dr. John S. Tooms, 876
Methods (Mathematical), of Operations Research (Thomas L. Saaty), *review* by Prof L. S. Goddard, *erratum*, 433
Methods (Physical, Chemical and Biological), of Study in High Molecular Weight Carbohydrates (Chemical Society Symposium on), 507
Methods (Spectroscopic), of Pharmaceutical Analysis (Brighton Technical College School of Pharmacy Course of Lectures on), 76
Methoxide (Lithium) Structure of (P. J. Wheatley), 681
3-Methoxy-4-hyd[illegible]yphenylglycol and Metanephrine in Phaeochromocytoma Tissue : Presence of (Dr. Irwin J. Kopin and Dr. Julius Axelrod), 788
3-Methyl Histamine : Copper (II) Complexes of Histamine and (Dr. R. Leberman and Dr. B. R. Rabin), 768
Methylated Cellulose (Partially) : Optical Rotatory Dispersion Studies on (W. Brock Neely), 159
Methylation (Auxin-induced), in Maize (Dr. Robert Cleland), 44
Methylglyoxal Formation from Aminoacetone by Ox Plasma (Dr. W. H. Elliott), 467
Meurman, Leo, and others : Excretion of Rose Bengal in Bile, 847
Meusel, Prof. H. : At the meeting of the Flora Europaea Organization in Vienna (Problems of Geographical Distribution and Taxonomy), 16
Mevalonic Acid : Stereospecificity of Enzymic Reactions involving (Rita H. Cornforth, K. Fletcher, Hermione Hellig and Dr. G. Popják), 923
Mexican Species of *Solanum* : Self-Incompatibility System in Two (Kamla K. Pandey), 483
Miani, Dr. N. : Proximo-Distal Movement along the Axon of Protein synthesized in the Perikaryon of Regenerating Neurons, 541
Mica : Determination of Tetrahedral Aluminium in, by Infra-Red Absorption Analysis (Dr. R. J. P. Lyon and Dr. W. M. Tuddenham), 374
Mice : An Autoradiographic Study of the Distribution in, of Œstrogens labelled with Carbon-14 and Tritium (Dr. J. C. De Paepe), 264
  Cementing Substances in Metastasizing and Non-Metastasizing Transplantable Tumours in (G. Gasić, F. Loebel and O. Badínez), 864
Mice surviving Systemic Leukaemia (*L*1210) : Immunity of, to Antifolic Resistant Variants of the Disease (Dr. Abraham Goldin, Stewart R. Humphreys, Gerald O. Chapman, Dr Michael A. Chirigos and John M. Venditti), 219
Mice (Inbred and F_1 Hybrid) : Response of, to Hormone (Dr. C. K. Chai), 514
Mice (Pseudopregnant) : Implantation of Tissue Transplants in the Uteri of (Ian B. Wilson), 553
Mice (Temporarily Fasted) : Use of Chorionic Gonadotropin to prevent Early Embryonic Mortality in (T. J. McClure), 622
Micro- and Semi-microchemical Methods (Norwood Technical College, London, Course on), 737
Microbial Oxidation of Glycollate via a Dicarboxylic Acid Cycle (Dr. H. L. Kornberg and J. R. Sadler), 153
Microbial Synthesis of Cysteine : Cysteine-S-sulphonate as an Intermediate in (Dr. Taro Nakamura and Dr. Ryo Sato), 163
Microbial Variation (edited by Prof. V. D. Timakov), translated from the Russian by G. H. Beale, *review* by Dr. E. F. Gale, 344
Microbial Variation and Russian Experiments, *review* by Dr. E. F. Gale, 344
Microbiology : Applied, *review* by Dr. J. W. G. Porter, 565
Microbiology (Applied) : Advances in (edited by Wayne W. Umbreit), Vol. 1, *review* by Dr. J. W. G. Porter, 565
Microchemical Journal, Vol 3, No. 3, 580
Microchemical (Semi-) Methods Micro- and (Norwood Technical College, London, Course on), 737
Microchemistry : Progress in, 580
Micro-organisms . Continuous Culture of (Microbiology Group of the Society of Chemical Industry Symposium on), 433
  Effect of, on the Development of Roots and Root Hairs of Subterranean Clover (*T. subterraneum*), (A. D. Rovira and G. D. Bowen), 260
Micropulsations on November 27, 1959 : Rare Hiss, Earth Currents and (E. M. Wescott, J. H. Pope, D. O. Dyer and Dr. W. H. Campbell), 231
Micropulsations in the Earth's Magnetic Field simultaneous with Pulsating Aurora (Dr. W. H. Campbell), 677
Micropulsations (Auroral Zone) . Correlation of Audio-Frequency Electromagnetic Radiation with (Dr. J. Aarons, G. Gustafsson and A Egeland), 148
Microscopic Structure (Electron-), of the Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* in Terms of Directional Sensitivity : A Functional Interpretation of the (Prof. O. Lowenstein and J. Wersall), *errata*, 76
Microscopical Society (Royal), and the Electron Microscopy Group of the Institute of Physics : Discussion on Co-ordination of Light and Electron Microscopy, 660
Microscopy Symposium : National (McCrone Associates of the United States), 146
Microscopy (Electron) Co-ordination of Light and (Royal Microscopical Society and the Electron Microscopy Group of the Institute of Physics Discussion on), 660
  Study of Life-cycle of *Schizosaccharomyces octosporum* by means of Ultra-thin Sectioning and (S F. Conti and Prof. H. B. Naylor), 633
Microscopy (Electron), of the Golgi Apparatus (Dr. Owen L. Thomas), 703
Microsomal Malic Dehydrogenase (Dr. Kenneth H. Shull), 582
Microsome Fraction of Plant Cells : Occurrence of an Organ-Specific Antigen associated with the, and its Possible Significance in the Process of Cellular Differentiation (Dr. S. T. C. Wright), 82
Microsomes : Inhibition of Lipid Peroxidation in, by Vitamin E (Dr. A. L. Tappel and Dr. H. Zalkin), 35
Microwave Amplifiers : Solid State (Electronics Group and the Radio Spectroscopy Group of the Institute of Physics Conference on), 507
Microwave Spectrum of Fluorine Cyanide (Dr. J. Sheridan, J. K. Tyler, Dr. E. E. Aynsley, R. E Dodd and R. Little), 96
Mid-Argyll : Evidence for Tertiary Crustal Distortion in (Dr. J. L. Knill), 234
Midbrain Lesions (Cerebellar and), in Scrapie (Dr I. Zlotnik), 785
Mid-Tertiary Stratigraphical Palaeontology (F E. Eames, F. T. Banner, W. H. Blow and W. J Clarke), 447
Middle Ages : The Science of Mechanics in the (Marshall Clagett), *review* by Prof. E J. Dijksterhuis, 491
Middlesex Hospital Medical School, London : Retirement of Prof J. H. Woodger as head of the Department of Biology, 75
  Appointment of Prof. D. R. Newth as head of the Department of Biology, 75
  Appointment of Dr J. H Green to the University of London readership in physiology, 737
Midst : The Ark in our (R. S. R. Fitter), *review* by Frances Pitt, 799
Migahid, A. M. : Water Relationships of Plants in Arid and Semi-Arid Conditions (Mechanisms of Survival under Dry Conditions), 435
Milbourn, G. M , and others : Relationship between the Rate of Fall-out and the Concentration of Strontium-90 in Human Diet in the United Kingdom, 498
Mild Conditions : Synthesis of Phthaloyl Amino-Acids under (G. H. L. Nefkens), 309
Mild Substitution Reactions : Inactivation of Erythropoietin by Neuraminidase and by (Dr. Peter H. Lowy, Dr. Geoffrey Keighley and Dr. Henry Borsook) 102
Milk : Effect of Different Types of, on Intestinal Motility (Prof. A. H. Mohamed, O. Zaki, K. Zaki and L. Fahim), 773
  Reduction of the Radioactive Content of, by a Feeding Procedure (Dr. Robert H. Fetner and Dr. Randall W. Carter), 858
Mill, C. C. (edited by) : Rheology of Disperse Systems—Proceedings of a Conference organized by the British Society of Rheology (Swansea, 1957), *review* by Dr. G. W. Scott Blair, 878
Mill, Dr. P. J. : Induction of a Vascular Permeability Factor by the Interaction of Guinea Pig Tissue Debris with Serum, 246
Millar, Prof. C. E., and others : Fundamentals of Soil Science, third edition, *review* by Dr. R. M. S. Perrin, 2

Millar, H. R. (Houghton, D. R, and): Spread of the Ascidian, *Styela mammiculata* Carlisle, 862
Millen, Dr J. W., and Woollam, Dr. D. H M · Potency of Parenteral Vitamin A, 249
Miller, G R, and others: Presence of Aldosterone-stimulating Hormone in Urine, 540
Miller, J. M., and others · Evidence for the Existence of a Potassium Rhenium Hydride and its Bearing on the Nature of the (—I) -Oxidation State of Rhenium, 528
Miller, Prof. Leon L · Glucagon, a Protein Catabolic Hormone in the Isolated Perfused Rat Liver, 248
Miller, Dr. Lawrence P.: Fungitoxicity of Metal Ions, 545
Mills, Dr. A A, and others · Potassium–Argon and Rubidium–Strontium Ages of some Granites from Britain and Eire, 495
Mills, C. F., and Fell, B. F.: Demyelination in Lambs born of Ewes maintained on High Intakes of Sulphate and Molybdate, 20

Museum (National), United States . Annual Report for 1958-59, 891
Museum (National), of Wales . Department of Industry, 434
Museum (Natural History), Khartoum : Report for 1956-58, 736
Museum (Royal Scottish) : Upjohn Cell Model at the, 13
Museum (Sarawak) : *Journal* of the, Vol. 8, June 1958, 581
Museum (Transvaal) : Bulletin, July 1959, 214
  Annual Report for 1958-59, 355
Museums and Art Galleries of Britain : State Aid for, 890
Mushrooms (Cultivated) : 'Watery Stipe' of (Doreen G. Gandy), 482
Musical Rites, 124
Mussels A New Record of *Mytilicola intestinalis* Steuer, a Parasitic Copepod of (J. Wickstead), 258
Musy, Anne (Martin, Ariane, et) : La Vie des Colibris—les Trochilidés, *review* by J. D. Macdonald, 67
Muta, Prof. Nobuyoshi (Kaneta, Dr. Koichi, and) . Radiosensitivity of the Pre-Irradiated Yoshida Sarcoma, 858
Mutagenesis (Formaldehyde-induced) : Significance of Ribonucleic Acid in the Mechanism of (Dr. Thomas Alderson), 904
Mutagenic Action of Mitomycin *C* on *Escherichia coli* (Teiji Iijima and Atsuyoshi Hagiwara), 395
Mutants (*Hfr*) · Role of, in *F*+ x *F*– Crosses in *Escherichia coli* K12 (P. Reeves), 265
Mutations (Ultra-violet-induced) : Correlation of Loss of Photoreversibility of, with Deoxyribonucleic Acid Synthesis (Dr. F. L. Haas and Dr. C. O. Doudney), 637
Mycenaean and Classical Greece, *review* by Dr. Hugh Plommer, 493
Mycobacteria · Interspecific Hybridization among (Dr. Stephen E. Juhasz), 265
Mycobacterium lepraemurium Elongation of a Leprosy Bacillus, in a Cell-free Medium (Dr. P. D'Arcy Hart and Dr. R. C. Valentine), 58
Mycobacterium tuberculosis avium · Influence of Cobalt and Zinc Ions on the Growth and Porphyrin Production of (Dr. D. S. P. Patterson), 57
Mycobacterium Cell Fractions *in vivo* : Effect of Streptomycin on the Incorporation of Tyrosine labelled with Carbon-14 into Protein of (Dr. T. Erdos and Dr. Agnes Ullmann), 100
Mycoses : Animal, *review* by J. E Smith, 720
Myers, T. C., and others Vasodepressor Effect of Adenosine Phosphates and 5'-Adenylmethylenediphosphonic Acid, an Analogue of Adenosine Triphosphate, 772
Myoglobin · Structure of—a Three-Dimensional Fourier Synthesis at 2-Å. Resolution (Dr. J. C. Kendrew, Dr. R. E. Dickerson, Dr. B. E. Strandberg, Dr. R. G. Hart, Dr. D. R. Davies, Dr. D. C. Phillips and Dr. V. C. Shore), 422
Myres, Dr. J. N. L. : Industrial Archaeology, 357
Mystacoceti (Suborders Odontoceti and), (Cetacea) : Some Similarities and Dissimilarities in the Structure of the Skin among the Members of the (Dr. W. Sokolov), 745
Mytilicola intestinalis Steuer, a Parasitic Copepod of Mussels : A New Record of (J. Wickstead), 258
Myxine glutinosa : The Pituitary of (A. J. Matty), 180
Myxomatosis in Britain (Hon. Miriam Rothschild), 257
Myxovirus para-influenzae 3 · Identification of a Bovine Mucosal-Disease Virus isolated in Sweden as (K. Bakos and Dr. Z. Dinter), 549

NAGLER Reaction of some *Clostridia* : Observations on the (Dr. A. T. Willis), 943
Nakagaki, M. (Heller, W., and) : At the Ninth Canadian High Polymer Forum (The Exact Theory of the Scanning Method for determining Particle Sizes from Light Scattering), 359
Nakamura, Kenji, and others : Oscillographic Investigation of Electrodeposition of Chromium, 377
Nakamura, Dr. Taro, and Sato, Dr. Ryo : Cysteine-S-sulphonate as an Intermediate in Microbial Synthesis of Cysteine, 163
Nakatsugawa, Tsutomu : Spectrophotometric Measurement of Cytochromes in the Red and the White Muscles of the American Cockroach, *Periplaneta americana* L., 85
Nandi, Uma Shankar, and Palit, Santi R. : Chain Transfer in Mixed Solvent Systems, 235
Narrow Tubes : Blood Flow through (Dr. Robert H. Haynes), 679
Nash, A. S., and Mullaney, P. D. : Commercial Application of Gibberellic Acid to Hops, 25
Natarajan, K. V. : Algology (Studies on the Mineral Nutrition of a *Selenastrum*), 820
National Academy of Sciences (United States), and others : Symposium on Basic Research (edited by Dael Wolfle), 716
National Academy of Sciences (United States) (National Research Council) : Appointment of Dr. Kinzel as chairman of the Division of Engineering and Industrial Research, 14
National Academy of Sciences (United States) (American Geophysical Union of the) : Formation of a Planning Committee on Planetary Sciences, 658

National Agricultural Advisory Service : Retirement of W. Morley Davies as senior advisory officer, 504
  Appointment of Dr. N. H. Pizer as senior advisory officer, 504
National Central Library : Forty-third Annual Report of the Executive Committee (1958-59), 431
National Centre of Information on Automatic Programming of Digital Computers (Brighton Technical College), 214
National Coal Board : Research on Coal Utilization, 431
National Coal Board (Mining Research Establishment of the), in consultation with the Building Research Station (D S I R.) : Conference on Non-Metallic Brittle Materials—Proceedings, Mechanical Properties of Non-Metallic Brittle Materials (edited by W. H. Walton), *review* by Dr. David Train, 344
National Council for Technological Awards : Appointment of Sir Harold Roxbee Cox as chairman, 286
National Fruit and Cider Institute, Long Ashton, Bristol : Annual Report for 1958, 743
National Gallery, London : Retirement of F. I. G. Rawlins as scientific adviser and deputy keeper, 656
  Appointment of R. H. G. Thomson as scientific adviser and deputy keeper, 657
National Heart Institute of the United States National Institutes of Health: Grant of 1,100,000 dollars to Dr. David K. Detweiler, for research and training in comparative cardiovascular studies, 433
National Institute of Agricultural Botany : Appointment of G. W. G. Briggs as assistant director, 430
National Institute for Research in Dairying Retirement of Dr A. T. R. Mattick as deputy chief scientific officer, 11
National Institutes of Health (United States) : Grant of 1,100,000 dollars from the National Heart Institute to Dr David K Detweiler, for research and training in comparative cardiovascular studies, 433
National Microscopy Symposium (McCrone Associates of the United States), 146
National Museum, Bloemfontein : Annual Report for 1958,59, 432
National Museum (United States) : Annual Report for 1958-59, 891
National Museum of Wales · Department of Industry, 434
National Research Council (United States) (National Academy of Sciences) : Appointment of Dr. Kinzel as chairman of the Division of Engineering and Industrial Research, 14
National Research Development Corporation : Annual Report for 1958-59, 361
National Research Fellowship (New Zealand) for 1960 awarded to Dr. R. H. Hedley, 356
National Science Foundation (United States) : Fellowship Awards for 1960, 145
  Scientists and Engineers in American Industry, 213
  Federal Funds for Science, 1958, 1959 and 1960, 813
  Funds for Research and Development in the United States, 813
  American Science Manpower—Employment and other Characteristics (1954-55), 890
National Vegetable Research Station : Ninth Annual Report (1958), 890
Native Protein, an Immunizing Agent against Virus Infection (Dr. G. Loebenstein), 122
Native Serum Proteins : Cell-growth of Plant Roots, Inorganic Salts and (Dr. Folke Rønnike), 151
NATO (Combustion and Propulsion Panel of the Advisory Group for Aeronautical Research and Development) : Colloquium on High Mach Number Air-breathing Machines, 146
Natural Gas : Geochemical Methods of Prospecting and Exploration for Petroleum and (A. A. Kartsev, Z. A. Tabasaranskii, M I Subbota and G. A Mogilevskii), English translation edited by Paul A. Witherspoon and William D. Romey, *review* by Dr. John S. Tooms, 876
Natural Germination Stimulator in the Dormancy of *Fraxinus excelsior* L. : Interaction of Growth Inhibitor and a (T. A. Villiers and Prof. P. F. Wareing), 112
Natural Graphites (Artificial and) : X-Ray Measurement of Thermal Expansion Perpendicular to the Layer Planes of (E. G. Steward and B. P. Cook), 78
Natural History Museum, Khartoum : Report for 1956-58, 736
Natural Radioactivity of Samarium and Neodymium (M. Karras and Dr. M. Nurmia), 601
Natural Resources : Conservation of (edited by Guy-Harold Smith), second edition, *review* by Prof. L. Dudley Stamp, 345
  The Conservation of (Richard C. Haw), *review* by Prof. L. Dudley Stamp, 345
Natural Resources in Scotland · Committee on (Dr. F. N. Woodward), 574
Natural Resources (Nature and), International Union for Conservation of : Bulletin 8, Protection of Nature in the Soviet Republic of Azerbaijan (G. Aliev), 580
Nature of the (–I)-Oxidation State of Rhenium : Evidence for the Existence of a Potassium Rhenium Hydride and its Bearing on the (A. P. Ginsberg, J. M Miller, J. R. Cavanaugh and B. P. Dailey), 528
Nature of Production in the Sea : On the (Dr. D. H. Cushing), 218
Nature in the Soviet Republic of Azerbaijan : Protection of (G. Aliev), 580
Nature and Man's Fate (Prof. Garrett Hardin), *review* by T H. Hawkins, 65
Nature and Natural Resources, International Union for Conservation of : Bulletin 8, Protection of Nature in the Soviet Republic of Azerbaijan (G. Aliev), 580
Nature Conservancy · Research on Grouse, 889
Nature (Chemical), of the Cell Wall of the Green Algae, *Codium*, *Acetabularia* and *Halicoryne* (Yoshihiko Iriki and Tomoo Miwa), 178
Nature (Individual Specific), of the Cold Auto-Antibodies of Acquired Haemolytic Anaemia (Dr. T. N. Mehrotra), 323
Naval Headquarters (United States) : Exhibit on Rocket Astronomy lent to the Science Museum, London, 215
Navigational Instrument : Electronic Sector-Scanning Asdic, an Improved Fish-Locator and (Prof. D. G. Tucker and Dr. V. G. Welsby), 277
Navy : Basic Research in the (Arthur D. Little, Inc., Industrial Bulletin 369), 588
Naylor, Prof. H. B. (Conti, S. F., and) : Study of Life-cycle of *Schizosaccharomyces octosporus* by means of Ultra-thin Sectioning and Electron Microscopy, 633
Neal, J. (Haessig, H. A., and) : At the Ninth Canadian High Polymer Forum (The Degradation of Cellulose by Megavolt Electrons), 358
Necrosis (Dietary Liver) : Intracellular Potassium in (A. E. M McLean), 936
  'Phenergan' and Versene in (A. E. M. McLean), 191
Nedeco (Netherlands Engineering Consultants) . River Studies and Recommendations on Improvement of Niger and Benue, *review* by Prof. W. G. V. Balchin, 274
Need for Inorganic Phosphate in Oxidations stimulated by Dinitrophenol (P. Borst and Prof. E. C. Slater), 537
Neely, W. Brock : Optical Rotatory Dispersion Studies on Partially Methylated Cellulose, 159
Nefkens, G. H. L. : Synthesis of Phthaloyl Amino-Acids under Mild Conditions, 309
Negative Temperature Coefficient : Zone of, in Hydrocarbon Oxidation (K. C Salooja), 32
Negroes (Djuka), and Oyana and Carib Indians : Distribution of Gm^a and Gm-like among Javanese, (Prof. Arthur G. Steinberg, Rachel Stauffer and Hugh Fudenberg), 324
Neihof, Rex, and Schuldiner, Sigmund : Simple Non-gassing Electrodes for Use in Electrophoresis, 526
Nelson, G. K. (Mundy-Castle, A. C., and) : Intelligence, Personality and Brain Rhythms in a Socially Isolated Community, 484
Nematophagous Fungi. Induction of Traps of, using *Panagrellus redivivus* (Dr. Armen C. Tarjan), 779
Neodymium : Natural Radioactivity of Samarium and (M. Karras and Dr. M. Nurmia), 601
Neopentane : Molecular Structure of (Prof. R. L. Livingston, C. Lurie and Dr. C. N. R. Rao), 458
Nerve Endings : Is there a Leakage of Acetylcholine from Postganglionic Parasympathetic? (Prof. N. Emmelin), 297
Nervous System (Central) : Mitotic Pattern and Histogenesis of the (Dr. S. Fujita), 702
Ness (Mrs. Patrick) Award of the Royal Geographical Society awarded to R. J. Adie, 735
Net (Stochastic) : Performance of a (M. C. Goodall), 557
Netherlands : Ergonomics in the (Ergonomics Research Society), 356
Netherlands Engineering Consultants (Nedeco) : River Studies and Recommendations on Improvement of Niger and Benue, *review* by Prof. W. G. V. Balchin, 274
Neuraminidase : Inactivation of Erythropoietin by, and by Mild Substitution Reactions (Dr. Peter H. Lowy, Dr. Geoffrey Keighley and Dr. Henry Borsook), 102
Neurocrania (Selachian) : Dorsal Fontanelles in (Dr. A. R. Hamdy), 939
Neurohypophyseal Principle in the Elasmobranch Pituitary (Dr. A. M. Perks, Dr. M. H. I. Dodd and Dr. J. M. Dodd), 850
Neurohypophysis : 'Synaptic Vesicles' in the (Dr. R. L. Holmes and Sir Francis Knowles), 710
Neurone-blocking Agents (Powerful Adrenergic), related to Choline 2,6-Xylyl Ether Bromide (A L. A. Boura, G. G. Coker, F. C. Copp, W. G. Duncombe, A. R. Elphick, A. F. Green and A. McCoubrey), 925
Neurones (Central Auditory) : Pitch Discrimination in Orthoptera (Insecta) demonstrated by Responses of (Dr. G. A. Horridge), 623
Neurons (Regenerating) : Proximo-Distal Movement along the Axon of Protein synthesized in the Perikaryon of (Dr. N. Miani), 541
Neurosecretory Vesicle : A Highly Organized Structure within a (Sir Francis Knowles), 709
Neurosecretory Cells *in situ* (Insect) : A Method of Controlling the Temperature of (R. H. J. Brown and Janet E. Harker), 392
Neurospora crassa : Mediation of the Genetic Control of Protein Synthesis in Cell-free Extracts of (S. D. Wainwright), 314
Neurotoxic Component of the Venom of the Sea Snake, *Enhydrina schistosa* : Isolation of the (Jocelyn E. Carey and Dr. E. A. Wright), 103
Neutralization of Human Serum and Pituitary Thyrotropic Fractions with Antisera to Bovine Pituitary Thyrotropin (Dr. Sidney C. Werner, Ephraim Otero-Ruiz, Beatrice C. Seegal and Robert W. Bates), 472
Neutron Activation Analysis of Ancient Roman Potsherds (V. M. Emeleus and G. Simpson), 196
Neutron Diffraction Study of Antiferromagnetic Spin Waves in α-Ferric Oxide (J. A. Goedkoop and T. Riste), 450
Neutron Exposure (Low-Dose) : Conditioned Avoidance Behaviour Induced by (Dr. John Garcia and Dr. Donald J. Kimeldorf), 261
Neutron Project : The Harwell (Dr. M. J. Poole and Dr. E. R. Rae), 280
New Approach to the Synthesis of O-Phosphoserine and related Peptides (Dr. D. Theodoropoulos, Prof. J. Gazopoulos and I. Souchleris), 606
New Approach to Tumour Immunity (Dr. Kurt Stern), 787
New Cercaria of the Subfamily Gymnophallinae (Trematoda : Digenea) developing in a Unique 'Parthenita' in *Littorina saxatilis* (Olivi), (B. L. James), 181
New Complex Calcium Ferrite Phases : Two (Stig Holmquist), 604
New Delhi Symposium on Algae (Dr. G. E. Fogg), 820
New Drug Active against Babesial Infections . 3:3'-Diamidinocarbanilide, a (Dr. J. N. Ashley, S. S. Berg and J. M. S. Lucas), 461
New Group-Specific System : Inheritance of a, demonstrated in Normal Human Sera by means of an Immuno-Electrophoretic Technique (Dr. Jan Hirschfeld, the late Bengt Jonsson and Marianne Rasmuson), 931
New Hypothesis : Radiation Carcinogenesis, a (Dr. P. R. J. Burch), 135
New Metabolite of Chloramphenicol (W. A. Dill, E. M. Thompson, R. A. Fisken and A. J. Glazko), 535
New Palaeolithic Find in Tapti Valley, Khandesh, India (Prof. C. R. Karnik), 711
New Plant-Growth Response : Magnetotropism, a (Prof. L. J. Audus), 132
New Record of *Mytilicola intestinalis* Steuer, a Parasitic Copepod of Mussels (J. Wickstead), 258
New Research Qualification (Royal Institute of Chemistry), 285
New Route to 1-Substituted Pyrazole-4-Carboxylic Acids (Dr. D. G. O'Donovan, A P. Carroll and Prof. J. Reilly), 460
New Silicon Boride, SiB_4 (Dr. Carl F. Cline and Dr. Donald E. Sands), 456
New Univalent Cobalt Complexes of the $[Co^{I}(CN)_5X]$ Type (Dr. Nobufumi Maki), 682
New Wool Follicles : Formation of, in the Adult Sheep (A. H. Brook, B. F. Short and A. G. Lyne), 51
New Year Honours List, 74
New York Academy of Sciences : Conference on Actinomycins and their Importance in the Treatment of Tumours in Animals and Man, 76
New Zealand : Red Deer and Vegetation in (New Zealand Department of Scientific and Industrial Research, Bulletin 135), 742
  Terrestrial Ostracods of (Ann Chapman), 121
New Zealand Department of Scientific and Industrial Research : Bulletin 135, Red Deer and Vegetation in New Zealand, 742

New Zealand National Research Fellowship for 1960 awarded to Dr. R. H. Hedley, 356
Newborn : Haemolytic Disease of the, probably due to Anti-f (Dr. Philip Levine, Jane White, Marjory Stroup, C. M. Zmijewski and James F. Mohn), 188
Newth, Prof. D. R. : Appointed head of the Department of Biology in the Middlesex Hospital Medical School, London, 75 ; work of, 75
Nicholas, Dr. D. J. D., and Jones, Dr. O. T. G. : Oxidation of Hydroxylamine in Cell-free Extracts of *Nitrosomonas europaea*, 512
Nicholls, P. J. : Metabolism of Bemegride labelled with Carbon-14, 927
Nicholson, D. C. (Gray, Prof. C. H., and) : Violinoid Products of Oxidation of *d*-Urobilin, 380
Nicholson, E. M. : Birds and Forests (Relations between Birds and Forestry), 731
Nicol, Prof. T., and Ware, C. C. : Minimum Dose of Diethylstilboestrol required to Stimulate the Phagocytic Activity of the Reticulo-Endothelial System, 42
Nief, G , and others : Isotopic Distribution in a Greenland Iceberg, 232
Niemi, Dr. Mikko, and Ikonen, M. Histochemical Evidence of Aminopeptidase Activity in Rat Pineal Gland, 928
Niemi, Dr. Mikko, and others : Effects of Dehydration on the Mitochondria of the Mouse Kidney, 786
Niger and Benue : River Studies and Recommendations on Improvement of (Nedeco, Netherlands Engineering Consultants), *review* by Prof W. G. V. Balchin, 274
Nigeria Bronze Figures from (Frank Willett), 581
  Glucose-6-Phosphate Dehydrogenase Deficiency Trait in (Dr. H. M. Gilles, J. Watson-Williams and B. G. Taylor), 257
  Nocturnal Detection of Tsetse Flies in, with Ultra-Violet Light (W. McDonald), 867
  River Studies in, *review* by Prof. W. G. V. Balchin, 274
Night Sky . in February, 215 ; in March, 507 ; in April, 815
Nihilism : Beyond (Prof. Michael Polanyi), 146
Niobium Sulphides : Molybdenum and (Dr. F. Jellinek, Dr. G. Brauer and Dr. H. Muller), 376
Nissim, Dr. J. A. : Reduction of Intestinal Absorption by a Synthetic Chemical, 222
Nitrate Content of Herbage at Different Manurial Levels (Dr. G. ap Griffith), 627
Nitroacridine 3663 : Effect of, on Synthesis of Deoxyribonucleic Acid and Multiplication of T_2 Phage (Dr. G. Dénes and Dr. L. Polgár), 386
Nitrobacter Exogenous Respiration in (Prof. W. S. Silver), 555
Nitrobenzoic Acids . Intermediary Metabolism of, by Bacteria (R. B. Cain and N. J. Cartwright), 868
Nitrogen (Inorganic), in Animal Tissues : Enzymatic Cycle of (Dr. K. Yamafuji, Y. Osajima and H. Omura), 162
Nitrogen Feeding of Apple Trees by Post-Harvest Urea Sprays (Dr. K. Oland), 857
Nitrogen Fixation (Symbiotic), in a Grazed Tropical Grass–Legume Pasture (Dr. A W. Moore), 638
Nitrogen Metabolism in Plants (Prof. George C. Webster), *review* by Dr. G. Bond, 415
Nitrogen-containing Bases : Influence of, on the Rate of the Electrode Processes at the Dropping Mercury Electrode (V. Volková), 743
Nitrosomonas europaea : Oxidation of Hydroxylamine in Cell-free Extracts of (Dr. D. J. D. Nicholas and Dr. O. T. G. Jones), 512
Nocturnal Detection of Tsetse Flies in Nigeria with Ultra-Violet Light (W. McDonald), 867
Nogueira, Alfredo R , and others : A Survey of Abnormal Haemoglobins in Portuguese Guinea, 326
Nomenclature of Free Radicals : A Proposal for the (F. P. Lossing and Prof. C. A. McDowell), 161
Non-Ferrous Mining in Great Britain and Ireland : The Future of—Proceedings of a Symposium arranged by the Institution of Mining and Metallurgy in collaboration with the United Kingdom Metal Mining Association, 1958, *review* by Prof. K. C. Dunham, 801
Non-Gassing Electrodes (Simple), for Use in Electrophoresis (Rex Neihof and Sigmund Schuldiner), 526
Non-Indigenous Animals of Great Britain, *review* by Frances Pitt, 799
Non-Medical Uses . Antibiotics, their Chemistry and (edited by Dr. Herbert S. Goldberg), *review* by Prof Harold Raistrick), 797
Non-Metallic Brittle Materials, *review* by Dr. David Train, 344
  Mechanical Properties of (edited by W. H. Walton), (Proceedings of a Conference on Non-Metallic Brittle Materials, organized by the Mining Research Establishment of the National Coal Board in consultation with the Building Research Station (D.S.I R.), London, 1958), *review* by Dr. David Train, 344
Non-Metallic Layer Structures : Observation of Dislocations in (S. Amelinckx and P. Delavignette), 603
Non-Metastasizing Transplantable Tumours in Mice : Cementing Substances in Metastasizing and (G Gasić, F. Loebel and O. Badínez), 864
Non-Racemic Mixtures of the Isomers of Serine : Crystallization of (Prof. Martin L. Minthorn, jun., and Roger E. Koeppe), 459
Non-Volatile Organic Substances : Identification of the Structure of, by Gas Chromatography of Pyrolytic Products (Dr Jaroslav Janák), 684
Nordhagen, Prof. R. : At the meeting of the Flora Europaea Organization in Vienna (Taxonomy of Apomicts), 15
Nordic Meeting for Mining Geophysics, 436
Norepinephrine in the Brain Reserpine and the Levels of Serotonin and (H. Sheppard and J. H. Zimmerman), 40
Normal Baboons (Diabetic and) : Influence of Insulin on the Incorporation of 2-^{14}C-Sodium Pyruvate into Glyceride Glycerol in (N. Savage, Prof. J. Gillman and C. Gilbert), 168
Normal Human Sera : Inheritance of a New Group-Specific System demonstrated in, by means of an Immuno-Electrophoretic Technique (Dr. Jan Hirschfeld, the late Bengt Jonsson and Marianne Rasmuson), 961
Normal Human Urine : Presence of Metanephrine and Normetanephrine in (Elwood H. LaBrosse and Jay D. Mann), 40
Normal and Malignant Tissues : Anaerobic Glycolysis of Dispersed Cell Suspensions from (Dr. M. Zimmerman, T. M. Devlin and M. P. Pruss), 315
Normal and Pathological Growth : Withdrawal of Inhibition of Mitosis as a Mechanism influencing (Dr. J. T. Hemingway), 106
Normetanephrine : Presence of Metanephrine and, in Normal Human Urine (Elwood H. LaBrosse and Jay D. Mann), 40
Noro, T., and others : Inhibitory Actions of γ-Aminobutyrylcholine, 848
Norris, J. R. : Antigens of *Azotobacter*, 634
North, Dr. A. C. T., and others : Structure of Haemoglobin—a Three-Dimensional Fourier Synthesis at 5·5-Å. Resolution, obtained by X-Ray Analysis, 416
North America (Western) : The Zoogeography of, *review*, 800
North-Eastern Association of the British Federation of University Women (Department of Extra-Mural Studies and Education of King's College, Newcastle-upon-Tyne, in conjunction with the) : Refresher Course on Science in Schools, 286
Northern Kenya : Fossilized Human Remains from (Dr. T. Whitworth), 947
Northrop, D. C. (Gibbons, P. E., and) : Dielectric Devices (Experiments on the Long-lived Decay Components of Anthracene Scintillations), 360
Norway : Fall-out over, from High-Yield Nuclear Explosions (T. Hvinden, D. Hveding, A. Lillegraven and S. H. Small), 805
Norwood Technical College, London : Course on Micro- and Semi-microchemical Methods, 737
Notopterus (Lacepede) : Respiratory Function of the Swim-bladder of (Padmaker V. Dehadrai), 929
Novak, A., and Whalley, E. : At the Ninth Canadian High Polymer Forum (The Infra-red Spectrum of Polyformaldehyde), 359
Novel Angle : Antibiotics from a, *review* by Prof. Harold Raistrick, 797
Nuclear Bomb Fall-out : Increases in the Local Gamma-Ray Background due to (J. Vennart), 722
Nuclear Disarmament, Campaign for : Formation of a Scientists Group, 815
Nuclear Energy, Journal of : Part C to be devoted to Plasma Physics, Accelerators and Thermonuclear Research, 891
Nuclear Energy Conferences and Symposia in 1960 (International Atomic Energy Agency), 145
Nuclear Energy for Engineers and Technical Industrialists (European Nuclear Energy Agency of the Organization for European Economic Co-operation Courses on), 506
Nuclear Energy Agency (European), of the Organization for European Economic Co-operation : Courses on Nuclear Energy for Engineers and Technical Industrialists, 506
Nuclear Engineering Handbook (edited by Harold Etherington), *review* by Prof. W. Murgatroyd, 4
Nuclear Explosions (High-Yield) : Fall-out over Norway from (T. Hvinden, D. Hveding, A. Lillegraven and S. H. Small), 805
Nuclear Induction : Theory and Applications of (Prof Ajit Kumar Saha and Tara Prasad Das), *review* by W. M. Lomer, 67
Nuclear Membrane as a Barrier to the Free Diffusion of Proteins (Carl M. Feldherr and Ailene B. Feldherr), 250
Nuclear Power · Chemistry of (Dr. J. K. Dawson and Dr. G. Long), *review* by Prof. W. Murgatroyd, 4
Nuclear Power Plant (E. Openshaw Taylor), *review* by Prof. W. Murgatroyd, 4
Nuclear Power Technology, *review* by Prof. W. Murgatroyd, 4
Nuclear Propulsion · The Role of, in our Future Merchant Marine (Atomic Industrial Forum, the United States Atomic Energy Commission and the Maritime Administration Conference on), 582
Nuclear Reactor for Lucas Heights : A Second, 889
Nuclear Reactor Containment Buildings and Pressure Vessels (Department of Mechanical, Civil and Chemical Engineering, Royal College of Science and Technology, Glasgow, Symposium on), 660
Nuclear Research, European Organization for : Grant of 500,000 dollars from the Ford Foundation, 146
  The CERN Proton Synchrotron (J. B. Adams), 568
Nuclear Spin Resonance Spectrum of Isotactic Polystyrene (Dr. R. J. Kern and Dr. J. V. Pustinger), 236
Nuclear-labelled Morphine (Radiochemically Pure Tritium) : Preparation of (Anand L. Misra and Prof. L. A. Woods), 304
Nuclei of Human Amnion Cells infected with Measles Virus : Electron-dense Crystallites in (Richard F. Baker, Prof. Irving Gordon and Fred Rapp), 790
Nucleic Acid (Infective) : Role of, in the Production of Encephalomyocarditis Virus (Dr. F. K. Sanders), 802
Nucleic Acid Metabolism and the Initiation of Zygospores of *Rhizopus sexualis* : A Possible Relationship between (P. M. Hepden and Dr. B. F. Folkes), 254
Nucleic Acids : Aggregation and Staining Behaviour of Ultra-Violet Irradiated Films of (Prof. D. Shugar and Dr. J. Baranowska), 33
Nucleic Acids and Proteins in Denervated Muscle : Lack of Correlation between Synthesis of (R. Zák and Dr. E. Gutmann), 766
Nucleon Mass and Electron Mass : Ratio of (Dr. R. L. Worrall), 602
Nucleotide (Pyridine) : Energy-linked Reduction of Mitochondrial (Prof. Britton Chance and Dr Gunnar Hollunger), 666
Nucleotides of Deoxyribonucleic Acid of Rat Thymus Cells : Labelling of Deoxyribose with Carbon-14 in relation to Incorporation of Phosphorus-32 into the (Dr S. Itzhaki), 614
Nuffield Foundation : Technological Education and the, 658
  Fourteenth Annual Report, 817
Nuffield Foundation (Royal Society and) : Awards under the Commonwealth Bursaries Scheme, 212
Nurmia, Dr. M. (Karras, M., and) : Natural Radioactivity of Samarium and Neodymium, 601
Nurse, E. H. : Retirement as acting Government Chemist, 888 ; work of, 888
Nutrition : Clinical Aspects of (Prof. R. A. McCance and the Department of Experimental Medicine, Cambridge, Course on), 507
  Fifth International Congress on (International Union of Nutritional Sciences), 507
Nutrition in Europe : Education and Training in (Food and Agriculture Organization and the World Health Organization of the United Nations Symposium on), 585
Nutritional Sciences, International Union of : Fifth International Congress on Nutrition, 507
Nutting, Dr. J. · Appointed professor of metallurgy in the University of Leeds, 892
Nuutilainen, J. : Mining Geophysics (Gravimetric Application in Ore Prospecting), 436

OAKLEY, Dr. Kenneth P. : The Kanam Jaw, 945
Obell, Earl : Elected president of the United States Council for the Advancement of Science Writing, 735
Oblique Auroral Reflexions observed in the Auroral Zone : A Day-time Maximum of (Alv Egeland, Dr. Bengt Hultqvist and Johannes Ortner), 519
Observation of Dislocations in Non-metallic Layer Structures (S. Amelinckx and P. Delavignette), 603
Observations related to the Impact of *Lunik II* (G. Fielder), 11
Observations of Ionization induced by Artificial Earth Satellites (Prof. John D. Kraus, Robert C. Higgy, Donald J Scheer and W. Reed Crone), 520
Observations on the Nagler Reaction of some *Clostridia* (Dr. A. T. Willis), 943
Observations on the Solar Eclipse of October 2 (Dr. Jules Aarons, John P. Castelli, Ronald M. Straka and William C. Kidd), 230
Observations (Electron Paramagnetic Resonance), on Irradiated Thiols and Disulphides (T. Henriksen and A. Pihl), 307
Observations (Immunochemical), on Antisera to Purified Human Growth Hormone (Prof. Melvin M. Grumbach, Dr. Selna L. Kaplan and Dr. Sheila Solomon), 170
Observed Characteristics of an Ultra-High-Frequency Signal Traversing an Auroral Disturbance (J. C. James, L. E. Bird, R. P. Ingalls, M. L. Stone, J. W. B. Day, G. E K. Lockwood and R. I. Presnell), 510
Occupational Hygiene Society, British : International Symposium on Inhaled Particles and Vapours, 14, 433
Occurrence of an Organ-Specific Antigen associated with the Microsome Fraction of Plant Cells and its Possible Significance in the Process of Cellular Differentiation (Dr. S. T. C. Wright), 82
Occurrence of Riboflavin in Sturgeon Skin (Dr. A. Courts), 463
Oceanography, Canadian Committee on, 730
O'Connell, D. J. K. (edited by) : Proceedings of the Conference sponsored by the Pontifical Academy of Sciences and the Vatican Observatory on Stellar Populations, 1957, *review* by Prof. R. O. Redman, 412
Octopus : Arm Abnormality in (Herman E. Kumpf), 334
  The Plexiform Zone and Shape Recognition in the (Dr J. A. Deutsch), 443
O'Donovan, Dr. D. G., and others : A New Route to 1-Substituted Pyrazole-4-Carboxylic Acids, 460
Odontoceti and Mystacoceti (Suborders), (Cetacea) : Some Similarities and Dissimilarities in the Structure of the Skin among the Members of the (Dr. W. Sokolov), 745
Oester, Dr. Y. T., and others : Vasodepressor Effect of Adenosine Phosphates and 5'-Adenylmethylenediphosphonic Acid, an Analogue of Adenosine Triphosphate, 772
Œstrogens labelled with Carbon-14 and Tritium : An Autoradiographic Study of the Distribution in Mice of (Dr. J. C De Paepe), 264
Œstrogens (Urinary), of the Dog (Dr John Kristoffersen and Weiert Velle), 253
Œstrone–Protein Conjugates : Antigenicity of (Dr. L Goodfriend and Prof. A. H. Sehon), 764
Ogilvie, Lady : Appointed a member of the Commonwealth Scholarship Committee in the United Kingdom, 505
O'Halloran, N. G : Geological Implications of Recent Geophysical Work in the British Isles, 739
Ohio State University : Symposium on Molecular Structure and Spectroscopy, 582
Oil : Gasification of Coal and, 431
Oil (Essential), of *Acorus calamus* L. of Indian Origin : Separation of the Hypnotic Potentiating Principles from the, by Liquid–Gas Chromatography (Ross M. Baxter, P. C Dandiya, S. I. Kandel, A Okany and Prof. G. C. Walker), 466
Oil (Lingcod Liver) : A Substance in, which prevents Hypercholesterolaemia in Cholesterol-fed Chickens (J. D. Wood and Jacob Biely), 473
Oil Heat : Britain Turns to, 355
Oil-Heating : Domestic, 355
Oil and Colour Chemists, Association of : Twelfth Technical Exhibition, 286
Oils containing Linoleic Acid : The Stereo-Configuration of 2,4-Decadienols isolated from (G Hoffmann and J. G. Keppler), 310
Okada, Hideya, and others : Oscillographic Investigation of Electrodeposition of Chromium, 377
Okada, Dr. S : Incorporation of Tritium-labelled Thymidine and Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid after Irradiation of the Deoxyribonucleic Acid Primer with γ-Rays, 193
Okany, A , and others : Biosynthesis of Ergot Alkaloids, 241
  Separation of the Hypnotic Potentiating Principles from the Essential Oil of *Acorus calamus* L of Indian Origin by Liquid–Gas Chromatography, 466
Okunuki, Prof. Kazuo, and others : Preparation of Crystalline Cytochromes from *Porphyra tenera*, 105
Oland, Dr. K. : Nitrogen Feeding of Apple Trees by Post-Harvest Urea Sprays, 857
Old Africa Rediscovered (Basil Davidson), *review* by M C. Burkitt, 645
Oldroyd, H. : Practical Insect Morphology, *review*, 3
Olduvai : An Alternative Interpretation of the Supposed Giant Deciduous Hominid Tooth from (Dr. J. T. Robinson), 407 ; (Dr. L. S. B. Leakey), 408
Olefines (Lower) : Industrial Chemistry of the (Chemical Society, the Institute of Petroleum, the Royal Institute of Chemistry and the Society of Chemical Industry Symposium on), 660
Oliver, Dr. D. R. : Sedimentation and Effective Viscosity, 912
Olson, Dr. Edwin A., and others : Radiocarbon Measurements and Annual Rings in Cave Formations, 93
Omura, H., and others : Enzymatic Cycle of Inorganic Nitrogen in Animal Tissues, 162
O'Neill, Prof. H. : The Magic Arc (Christmas Lecture of the Institute of Welding), 14
Onions, W J., and others : Meridional Reflexions in the X-Ray Diffraction Photographs of α-Keratin, 157
Operations Research : Mathematical Methods of (Thomas L. Saaty), *review* by Prof. L. S. Goddard, *erratum*, 433
  Mathematics and, *review* by Prof. L. S. Goddard, *erratum*, 433
Operatives (Unskilled and Semi-Skilled), in Manufacturing Industry : Training (W. D Seymour), 509
Oppenheimer, H. R. : Water Relationships of Plants in Arid and Semi-Arid Conditions (Mechanisms of Survival under Dry Conditions), 435
Oppenheimer, Dr. J. R. : Basic Research, 716
Optical Properties of Oxide-coated Metal Surfaces Exo-electron Emission and the (J. A. Ramsey), 602
Optical Rotation and Configuration of Poly-L-Tyrosine (Dr. James D. Coombes, Dr. E. Katchalski and Prof. Paul Doty), 534
Optical Rotatory Dispersion Studies on Partially Methylated Cellulose (W. Brock Neely), 159
Optical Scanning of Liquid Concentration in Flow Studies with Porous Models (Dr. E. R. Deutsch), 675
Optics : A Hundred Years of, 505
Optics (γ Ray) : Developments in (Prof. P. B. Moon), 427
Orbits (Satellite) : Variation of Upper-Atmosphere Density with Latitude and Season—Further Evidence from (D G. King-Hele and D. M. C. Walker), 727
Organ-Specific Antigen associated with the Microsome Fraction of Plant Cells : Occurrence of an, and its Possible Significance in the Process of Cellular Differentiation (Dr S T. C. Wright), 82
Organic Base (Low Molecular Weight), from the Dinoflagellate *Amphidinium carteri* (Peter J. Wangersky and Robert R. L. Guillard), 689
Organic Chemistry : Principles of (Prof. T. A. Geissman), *review* by Dr. C. B Reese, 131
Organic Compounds in Ancient Sedimentary Rocks : Presence of Carbohydrates and other (J. G. Palacas, F. M. Swain and Prof F. Smith), 234
Organic Crystals Surface-controlled Bulk Conductivity in (Dr. K. Kallman and Dr M. Pope), 753
Organic Hydroxy-Hydroperoxides, a Class of Hydroperoxides formed under the Influence of Ionizing Radiations (Dr George Scholes and Prof. Joseph Weiss), 305
Organic Matrix (Enamel) : Birefringence of the (J H. Allan) ,402
Organic Matter (Volatile], in Algal Culture Media and Sea Water (F. A J. Armstrong and G. T. Boalch), 761
Organic Substances (Non-volatile) . Identification of the Structure of, by Gas Chromatography of Pyrolytic Products (Dr Jaroslav Janák), 684
Organisms : A Starch Gel Immunoelectrophoretic Analysis of Human γ-Globulin demonstrating the Inter- and Intra-Specific Variation of (Dr. Morris Goodman), 474
Organisms (Hair-loosening) . Mode of Action of (Dr. K. J. Whiteley), 781
Organisms (Marine) : Influence of Filming and of Surface Texture on the Settlement of (Dr. D. J. Crisp and J. S. Ryland), 119
Organisms (Pleuropneumonia-like) : Decontaminating Tissue Cultures infected with (Dr. Leonard Hayflick), 783
Organization for European Economic Co-operation (European Nuclear Energy Agency of the) : Courses on Nuclear Energy for Engineers and Technical Industrialists, 506
Organized Structure (A Highly), within a Neurosecretory Vesicle (Sir Francis Knowles), 709
Organs : Correlation between the Electrolyte and Water Content of the, and Hypertension after Administration of Corticosteroids (Prof. L Laszt), 695
Organs (Y-) : Attempted Extraction of Crustacean Moulting Hormone from Isolated (Dr. Peter Karlson and Dorothy M. Skinner), 543
Oriented Quartz Inclusions in Garnets (A. L. Harris and Dr. N. Rast), 448
Origin of Placental Trophoblast (Dr. Israel Gordon), 118
Origin of Species (Botanical Society of the British Isles Conference to celebrate the Centenary of the publication of the), 216
Origin of Tektites (Dr. George Baker), 291
Origins (Academic) : University Students and their (R. K. Kelsall), 218
Ornithology, British Trust for, and the Forestry Commission : Conference on Birds and Forests, 731
Orr, Dr. Phil C , and others : Radiocarbon Measurements and Annual Rings in Cave Formations, 93
Orr, R. J At the Ninth Canadian High Polymer Forum (Thermochemical Aspects of Free Radical Butadiene-Styrene Copolymerization), 358
Orthophosphate Labelled with Phosphorus-32 Incorporation of, into Cerebral Phospholipids *in vivo* (Dr. G B. Ansell and S. Spanner), 826
Orthoptera (Insecta) : Pitch Discrimination in, demonstrated by Responses of Central Auditory Neurones (Dr. G. A. Horridge), 623
Ortner, Johannes, and others : A Day-time Maximum of Oblique Auroral Reflexions observed in the Auroral Zone, 519
Osajima, Y., and others : Enzymatic Cycle of Inorganic Nitrogen in Animal Tissues, 162
Osawa, Syozo (Otaka, Eiko, and) : Preparation and some Properties of a Soluble Ribonucleic Acid in Yeast, 921
Osborn, Prof T. G. B. : *Obituary* of Prof. J G. Wood, 282
Oscillographic Investigation of Electrodeposition of Chromium (Hideya Okada, Kenji Nakamura and Takeo Ishida), 377
Osteoclasts : Histochemical Demonstration of Succinic Dehydrogenase Activity in (Dr. M. S. Burstone), 866
Osteoclasts (Periosteal), Skeletal Development and Ageing (Dr. E. A. Tonna), 405
Österreichischen Akademie der Wissenschaften : Mitteilungen der Prähistorischen Kommission, Band 8 und 9, Willendorf in der Wachau—Monographie der Paläolith-Fundstellen 1-7, Teil 1, Text ; Teil 2, Inventar ; Teil 3, Abbildungen, 355

Ottestad, Prof Per : Forecasting the Annual Yield in Sea Fisheries, 183
Out of Doors (edited by Winwood Reade), *review* by B. J G Maitland, 567
Outdated Human γ-Globulin Preparations : Changes in (F. Skvařil), 475
Output (Carbon Dioxide), of *Periplaneta americana* : A Temperature-dependent Endogenous Rhythm in the Rate of (Dr. M. B. Wilkins), 481
Ouyang, Dr M. : Effect of Corona on Travelling Waves, 524
Ovaries of *Glossina morsitans* (D. S. Saunders), 121
Overall, Dr. John E., and others : The Shuttle-Box Behaviour of Albino Rats during Prolonged Exposure to Moderate-Level Radiation, 665
Overbeek's (Verwey and) Theory: Experimental Test of (B. K. Choudhury), 308

Overseas Information Services : British, 506
Oviduct of the Amphibia : Hormonal Control of Secretion in the (Patricia D. B. Lodge and Dr. C. L. Smith), 774
Owen, Prof. Benton B. (Harned, Prof. Herbert S., and) : The Physical Chemistry of Electrolytic Solutions, third edition, *review* by Dr. J N. Agar, 274
Owen, Dr. Maureen (Macpherson, Dr. Sheila, and) : Radioactive Materials and the Skeleton (The Relation of Radiation Damage to Radiation Dose from Strontium-90), 807
Owen, Prof. P. R. . Aerodynamic Capture of Particles (Process by which a Turbulent Wind-stream deposits Particles on the Roof of a Tunnel), 665
Ox Plasma : Methylglyoxal Formation from Aminoacetone by (Dr. W. H. Elliott), 467
Oxford Entrance Requirements : Classical Languages in, 660
Oxidase Activity in the Mitochondria of the Heart in some Lower Vertebrates : Histochemical Localization of (Prof. A. Stolk), 866
Oxidation of Hydroxylamine in Cell-free Extracts of *Nitrosomonas europaea* (Dr D. J. D. Nicholas and Dr. O. T. G. Jones), 512
Oxidation of Titanium–Iron Alloys (J. Stringer, M. G. Cowgill and N. C. Griffiths), 304
Oxidation of *d*-Urobilin : Violinoid Products of (Prof. C. H. Gray and D. C. Nicholson), 380
Oxidation Reduction Reactions on Ionizing Solvents (Faraday Society General Discussion on), 893
(—1)-Oxidation State of Rhenium : Evidence for the Existence of a Potassium Rhenium Hydride and its Bearing on the Nature of the (A. P. Ginsberg, J M. Miller, J. R. Cavanaugh and B. P. Dailey), 528
Oxidation (Acetate), by *Saccharomyces cerevisiae* var. *ellipsoideus* : Influence of Sorbic Acid on (Prof. Norberto J. Palleroni and María J. R. de Pritz), 688
Oxidation (Enzymic), and Translocation of Flavonoids : Effect of Glycosylation on the (Dr. E A. H. Roberts), 536
Oxidation (Hydrocarbon) : Zone of Negative Temperature Coefficient in (K. C. Salooja), 32
Oxidation (Microbial), of Glycollate via a Dicarboxylic Acid Cycle (Dr. H. L. Kornberg and J. R. Sadler), 153
Oxidations stimulated by Dinitrophenol Need for Inorganic Phosphate in (P. Borst and Prof. E. C. Slater), 537
Oxidative Enzymes in Skeletal Muscle : Reciprocal Relationship of Phosphorylase and (Victor Dubowitz and Dr. A. G. Everson Pearse), 701
Oxide-coated Metal Surfaces : Exo-electron Emission and the Optical Properties of (J. A. Ramsey), 602
Oxide (α-Ferric) : Neutron Diffraction Study of Antiferromagnetic Spin Waves in (J. A. Goedkoop and T. Riste), 450
17-Oxosteroids of Pregnant Ewe's Urine (Dr. W. F. Coulson), 612
Oxygen in Iron and Steel : Determination of (M. L. Pearce and C. R. Masson), 373
Oxygen 6300 Å Line (Atomic), in the Auroral Spectrum : Life-Time of the (W. Stoffregen and H. Derblom), 28
Oxygen Consumption of Hyperthyroid Rats . Effect of Adrenaline and Insulin upon the (R. L. Himsworth), 694
Oxygen Consumption of the Lung-Fish (*Protopterus*) : Action of Thyroxine on the Rate of (Dr. T. Mohsen and Dr. R. Godet), 108
Oxygen Consumption by Tissues from Rats injected with L- or D-Thyroxine (Dr. P. B. Dunne and Dr. D. F. Tapley), 622
Oxygen Tension Measurements in the Fluid Phase of Serum Agar Cultures of Bone Marrow Flecks : Effect of Amethopterin and 6-Mercaptopurine on the Pattern of (Dr. H. J. Woodliff and J. M. G. Davis), 477
O-Phosphoserine and related Peptides : New Approach to the Synthesis of (Dr. D. Theodoropoulos, Prof. J. Gazopoulos and I. Souchleris), 606
Oyana and Carib Indians : Distribution of Gm^{a} and Gm-like among Javanese, Djuka Negroes, and (Prof. Arthur G. Steinberg, Rachel Stauffer and Hugh Fudenberg), 324

PAARMA, H. : Mining Geophysics (Magnetic Gradient Measurements with regard to Ore Bodies and Structures), 436
Paasonen, Dr. M. K. (Karki, Dr. N. T., and) : Presence of 5-Hydroxytryptamine after Raunescine in Blood Plasma *in vivo*, 109
Pacovsky, V., and others : Effect and Parathyroid Extract on Citric Acid Concentration in the Rat Kidney, 173
Page, J. K · Appointed to the newly created chair of building science in the University of Sheffield, 144 ; work of, 144
Pagel, Dr. B. E. J. · The Lunar Surface, *review*, 718
Pairing (The Secondary), of Bivalents with Genetically Similar Chromosomes (Dr. Ralph Riley), 751
Palacas, J. G., and others : Presence of Carbohydrates and other Organic Compounds in Ancient Sedimentary Rocks, 234

Pantin, Prof. C. F. A. : The Biology of the Southern Cold Temperate Zone, 204
Paper Chromatography of Acidic Carbohydrates (Dr. David A. Rees), 309
Paper Electrophoretograms : Scanning of, after Protein Dyeing with Bromocresol Green (A. Clark), 243
Papillons : Les (Guy Mathot), *review* by Paul E. S. Whalley, 800
Paradoxical Effect of Magnesium Ions on Blood Coagulation (R. G. Huntsman, B. A. L. Hurn and Dr. H. Lehmann), 852
Paramagnetic Resonance Observations (Electron), on Irradiated Thiols and Disulphides (T. Henriksen and A. Pihl), 307
Parametric Amplifier Diode 'EW97/1' (General Electric Co., Ltd.), 355
Parasite Physiology : Host Influence on (Bureau of Biological Research Conference on), 897
Parasites : Ecology of (Parasitology Group of the Institute of Biology Discussion on), 290
Parasitic Copepod of Mussels : A New Record of *Mytilicola intestinalis* Steuer, a (J. Wickstead), 258
Parasympathetic Nerve Endings (Postganglionic) : Is there a Leakage of Acetylcholine from? (Prof. N. Emmelin), 297
Parathyroid Extract : Effect of, on Citric Acid Concentration in the Rat Kidney (A. Komárková, J. Vostál and V. Pacovsky), 173
Parenteral Vitamin A : Potency of (Dr. J. W. Millen and Dr. D. H. M. Woollam), 249
Parija, Prof. P. : Awarded the Birbal Sahni Medal for 1959 of the Indian Botanical Society, 893
Parker, W. J. : Resignation as secretary of the Polarographic Society, 14
Parkinson, Prof. C. Northcote : Administration of Universities, 816
Parliamentary and Scientific Committee · Annual Report for 1959, 890
Parr–Smolt Transformation : Variations in the Plasma-Level of Chloride in Hatchery-reared Yearling Atlantic Salmon during, and following Transfer into Sea-Water (Prof. Arthur H. Houston), 632
Parrish, B. B., and others : An Automatic Fish Egg Counter, 777
Parry, H. B. : Scrapie, a Transmissible Hereditary Disease of Sheep, 441
Parsons, Dr. D. : Variation of Magnetic Moment with Composition in the Iron–Vanadium Sigma Phase, 839
'Parthenita' in *Littorina saxatilis* (Olivi) : A New Cercaria of the Subfamily Gymnophallinae (Trematoda : Digenea) developing in a Unique (B. L. James), 181
Partial Hydrolysis of Decalcified Human Dentin Collagen : Peptides obtained from (Dr. C. C. Solomons), 101
Partially Methylated Cellulose : Optical Rotatory Dispersion Studies on (W. Brock Neely), 159
Particles : Aerodynamic Capture of (British Coal Utilization Research Association Symposium on), 664
  Elementary, *review* by Prof. D. H. Wilkinson, 200
Particles (Cytoplasmic), and their Role in Protein Synthesis (Colloid and Biophysics Committee of the Faraday Society Discussion on), 815
Particles (Elementary) : The Theory of (Dr. J. Hamilton), *review* by Prof. D. H. Wilkinson, 200
Particles and Vapours : Inhaled (British Occupational Hygiene Society International Symposium on), 14, 433
Pasteur and Cosmic Asymmetry (Prof. J. B. S. Haldane), 87
Pasture (Tropical Grass–Legume) : Symbiotic Nitrogen Fixation in a Grazed (Dr. A. W. Moore), 638
Pathak, Dr. M. A., and Fellman, Prof. J. H. : Activating and Fluorescent Wave-lengths of Furocoumarins:Psoralens, 382
Pathogenesis of Thrombosis (Dr. L. Poller), 937
Pathological Growth (Normal and) : Withdrawal of Inhibition of Mitosis as a Mechanism influencing (Dr. J T. Hemingway), 106
Pathway (Hexose Monophosphate), for the Glucose Metabolism in Human Pancreatic β-Cells : Evidence for the (Dr. James B. Field, Phyllis Johnson, Betty Herring and Arnold N. Weinberg), 468
Patil, S K. : Opening Address at the New Delhi Symposium on Algology, 820
Patnaik, Dr. D. (Sahoo, Balaram, and) : Carbonates of Uranium, 683
Patrick, Dr. C. R., and others : Photolysis of 1:3-Dichlorotetrafluoroacetone, 683
Patron's Medal of the Royal Geographical Society awarded to Prof. Théodore Moned, 735
Pattern of Oxygen Tension Measurements in the Fluid Phase of Serum Agar Cultures of Bone Marrow Flecks : Effect of Amethopterin and 6-Mercaptopurine on the (Dr. H. J. Woodliff and J. M. G Davis), 477
Pattern (Mitotic), and Histogenesis of the Central Nervous System (Dr. S. Fujita), 702
Pattern (Movement) : Age Differences in (K. F H. Murrell and D. G. Entwistle), 948
Patterns (Electrophoretic), of Haptoglobins in Apes (Dr. O. Makela, O.-V. Renkonen and Eeva Salonen), 852
Patterson, Dr. D. S. P. : Influence of Cobalt and Zinc Ions on the Growth and Porphyrin Production of *Mycobacterium tuberculosis avium*, 57
Patterson, J. E. (Silverman, Dr. Paul H., and) : Histotrophic (Parasitic) Stages of *Haemonchus contortus*, 54
Páty, Libor : Pumping Effect of a Gas Discharge High-Vacuum Pump, 674
Paul Instrument Fund : Awards of Grants, 504

Permeability of Dormant Bacterial Spores (Dr Samuel H Black, Dr. R E. MacDonald, Dr. Tadayo Hashimoto and Prof Philipp Gerhardt), 782
Permeability Factor (Vascular) : Induction of a, by the Interaction of Guinea Pig Tissue Debris with Serum (Dr P. J. Mill), 246
Permindex, Rome · Establishment of the Marconi International Award, 432
Peronospora tabacina Adam. Spore Release in (A. V. Hill), 940
Peroxidation (Lipid), in Microsomes Inhibition of, by Vitamin E (Dr. A. L. Tappel and Dr H Zalkin), 35
Peroxydes organiques en Radiobiologie (R Latarjet et *al*), *review* by Dr. W. Anderson, 202
Perrin, Dr. R M S. . Pedology, *review*, 2
Persistence of Herpes Simplex Virus in HeLa Cells (Dr. Carmen Gil Fernandez), 268
Personality and Brain Rhythms in a Socially Isolated Community : Intelligence, (A. C. Mundy-Castle and G. K. Nelson), 484
Personnel Management, Institute of · Broadsheet on Training Unskilled and Semi-Skilled Operatives in Manufacturing Industry (W. D. Seymour), 509
Pertussis Infection : Histamine Sensitivity in Children after (Dr R. K. Sanyal), 537
Perutz, Dr. M. F., and others Structure of Haemoglobin—a Three-Dimensional Fourier Synthesis at 5·5-Å Resolution, obtained by X-Ray Analysis, 416
Pest Infestation Research 1958—the Report of the Pest Infestation Research Board with the Report of the Director of Pest Infestation Research (Department of Scientific and Industrial Research), 78
Pest Infestation Research Board · Pest Infestation Research, 1958—the Report of the, with the Report of the Director of Pest Infestation Research (Department of Scientific and Industrial Research), 78
Petch, Prof. Norman James : Awarded the Rosenhain Medal for 1960 of the Institute of Metals, 735
Peters, Prof. B G : Ecology of Parasites (Effect of Soil Factors on Plant Parasitic Nematodes), 290
Petinov, N. S. : Water Relationships of Plants in Arid and Semi-Arid Conditions (Response of Plants to Water Supply), 435 ; (Reactions of Plants to Water and to Heat), 436
Petkus Winter Rye Effect of Gibberellic Acid on Flower Differentiation in (O. H Caso, H. R. Highkin and D Koller), 477
  Effect of Gibberellin on the Flower Initiation and Stem Extension in (Dr, O. N. Purvis), 479
Petroleum, Institute of, and others . Symposium on the Industrial Chemistry of the Lower Olefines, 660
Petroleum Chemistry and Refining : Advances in (edited by Kenneth A. Kobe and John J McKetta, Jr), *review* by Prof F. Morton, 201
Petroleum Gases (Liquified) · Uses of (Institute of Fuel Symposium on), 580
Petroleum Industry, *review* by Prof. F. Morton, 201
Petroleum and Natural Gas : Geochemical Methods for Prospecting and Exploration for (A A Kartsev, Z. A. Tabasaranskii, M. I. Subbota and G. A. Mogilevskii), English translation edited by Paul A Witherspoon and William D. Romey, *review* by Dr. John S. Tooms, 876
Petroleum Geology, *review* by Dr. John S. Tooms, 876
Pfizer Prize of the History of Science Society awarded to Dr Marie Boas's book 'Robert Boyle and Seventeenth Century Chemistry', 660
Phaeochromocytoma Tissue : Presence of 3-Methoxy-4-hydroxyphenylglycol and Metanephrine in (Dr. Irwin J Kopin and Dr. Julius Axelrod), 788
T_2 Phage Effect of Nitroacridine 3663 on Synthesis of Deoxyribonucleic Acid and Multiplication of (Dr. G Dénes and Dr. L Polgár), 386
Phagocytic Activity of the Reticulo-Endothelial System : Minimum Dose of Diethylstilboestrol required to Stimulate the (Prof T. Nicol and C C. Ware), 42
Pharmaceutical Analysis · Spectroscopic Methods of (Brighton Technical College School of Pharmacy Course of Lectures on), 76
Pharmacodynamic and Placebo Effects in Drug Evaluations in Man : Interactions between (Dr Walter Modell and Dr Margaret Garrett), 538
Pharmacology in London, 430
Pharmacology at University College, London, 810
β-Phase in a Copper–Lithium Eutectoid Alloy Decomposition of the (D. A. Moore, M White and Dr D R. F. West), 454
Phase (Inductive), of Antibody Formation by 6-Mercaptopurine : Inhibition of the, examined by the Transfer of Isolated Cells (Dr J Sterzl), 256
Phase (Sigma) : Variation of Magnetic Moment with Composition in the Iron–Vanadium (Dr. D Parsons), 839
Phase-Partition Chromatography (Reversed) : Separation of Uranium by (A. G. Hamlin and B J Roberts), 527
Phenanthrene Vapour : Spectrum of Delayed Fluorescence in—a Criterion of Purity (Dr. B. Stevens, E Hutton and Prof. G. Porter), 917
'Phenergan' and Versene in Dietary Liver Necrosis (A E M McLean), 191
Phenolase in Isolated Chloroplasts · Properties and Solubility of (A. M. Mayer and J Friend), 464
Phenolic Constituents of Cigarette Smoke : Some (Dr. W. Carruthers and Dr. R. A. W Johnstone), 762
Phenoloxidase System from *Periplaneta americana* (L) Specificity *in vitro* of a (D. L. Whitehead, P C. J. Brunet and P W. Kent), 610
p-Phenylenediamine-chloranil : Electron Spin Resonance Absorption of the Biradical Molecular Complex (Dr. Y. Matsunaga and Prof. C. A. McDowell), 916
Philip, J. R. : A Very General Class of Exact Solutions in Concentration-dependent Diffusion, 233
Philipose, M. T. : Algology (Indian Freshwater Phytoplankton in relation to Fisheries and Water Supply), 821
Philippu, Dr. A. J , and others : Effect of Testosterone Propionate and Insulin on Muscle Cholinesterase Activity, 320
Phillps, Prof. C. H. : Appointed a member of the University Grants Committee, 12
Philipson, Lennart (Albertsson, Per-Åke, and) : Antigen–Antibody in Liquid Two-Phase Systems—a Method for Studying Immunological Reactions, 38
Phillips, C. W. : Industrial Archaeology (The Ordnance Survey in relation to the Recording of Industrial Archaeology), 357
Phillips, Dr. D. C., and others . Structure of Myoglobin—a Three-Dimensional Fourier Synthesis at 2-Å. Resolution, 422
Phillips, Prof. John · Agriculture and Ecology in Africa, *review* by Dr. Kenneth Mellanby, 564
Philosophical Society of Washington : Election of Officers for 1960, 737
Philosophy : Pictorial History of (Dagobert D. Runes), *review* by Gerd Buchdahl, 67
Phosphatase (Acid) : Inactivation of, in Human Prostatic Homogenates *in vitro*—Role of Calcium (Prof. H J Tagnon and A. Steens-Lievens), 48
Phonon (Electron–) Interactions in Solids (Physical Society Conference on), 586
Phosphate (Inorganic) : Need for, in Oxidations stimulated by Dinitrophenol (P Borst and Prof E. C. Slater), 537
Phosphate (Inositol) : Configuration of, in Liver Phosphatidyl Inositol (Dr. J N. Hawthorne, P. Kemp and R. B. Ellis), 37
Phosphate (L-Serine) : Crystal Structure of (G H McCallum, Prof. J. Monteath Robertson and Dr. G. A. Sim), *errata*, 14
Phosphate (Tri*para*ethylphenyl) : Ataxia in Hens poisoned with (Ann Silver), 247
Phosphates (Adenosine), and 5′-Adenylmethylenediphosphonic Acid, an Analogue of Adenosine Triphosphate : Vasodepressor Effect of (James W. Flesher, Dr. Y. T. Oester and T. C. Myers), 772
Phosphatidyl Inositol (Liver) : Configuration of Inositol Phosphate in (Dr. J. N. Hawthorne, P Kemp and R. B Ellis), 37
Phosphides of the Platinum Metals (Stig Rundqvist), 31
Photography (High-Speed) International Congress on (Society of Motion Picture and Television Engineers), 14
Phospholipids (Cerebral), *in vivo* : Incorporation of Orthophosphate Labelled with Phosphorus-32 into (Dr. G. B Ansell and S. Spanner), 826
Phosphonic Acid (2-Aminoethane) : Isolation of, from Rumen Protozoa (Masaaki Horiguchi and Makoto Kandatsu), *erratum*, 146
Phosphorus-32 : Incorporation of Orthophosphate Labelled with, into Cerebral Phospholipids *in vivo* (Dr G B Ansell and S. Spanner), 826
  Metabolism of Polypores with (Prof S R Bose and P. Nonet-Maury), 828
Phosphorus-32 (Incorporation of), into the Nucleotides of Deoxyribonucleic Acid of Rat Thymus Cells Labelling of Deoxyribose with Carbon-14 in relation to (Dr. S. Itzhaki), 614
Phosphorylase and Oxidative Enzymes in Skeletal Muscle : Reciprocal Relationship of (Victor Dubowitz and Dr. A. G. Everson Pearse), 701
O-Phosphoserine and related Peptides · New Approach to the Synthesis of (Dr. D. Theodoropoulos, Prof. J. Gazopoulos and I. Souchleris), 606
Photobiology : International Congress in, 893
Photobiology Group : Spring Meeting, 893
Photograph (X-Ray), of Keratin impregnated with Heavy-Metal Salts : Enhancement of the High-Spacing Meridional Reflexions in the (W. S. Simpson and H. J. Woods), 157

Photographs (X-Ray Diffraction), of α-Keratin : Meridional Reflexions in the (W. J. Onions, H. J. Woods and P. B. Woods), 157
Photolysis of 1:3-Dichlorotetrafluoroacetone (R Bowles, H. Derbyshire, Dr. J. R. Majer and Dr. C. R. Patrick), 683
Photophores (Planktonic) A Possible Function of (John S. Colman), 112
Photoreversibility of Ultra-violet-induced Mutations : Correlation of Loss of, with Deoxyribonucleic Acid Synthesis (Dr. F L. Haas and Dr. C. O Doudney), 637
Photosynthesis : Energy-trapping Centres in (F. W. J Teale), 775
Photosynthesis in Synchronized Cultures of Algae A Reversible Inhibition of (Dr Constantine Sorokin), 933
Phthaloyl Amino-Acids . Synthesis of, under Mild Conditions (G. H. L. Nefkens), 309
Physical Chemistry of Electrolytic Solutions (Prof. Herbert S. Harned and Prof Benton B Owen), third edition, *review* by Dr. J N. Agar, 274
Physical Sciences : Research Fellowship in the (Central Electricity Generating Board), 286
Physical Society . Conference on Electron–Phonon Interactions in Solids, 586
Physical Society (Acoustics Group) Discussion on Vibrations, 899
Physical Society (Low-Temperature Group) : Symposium on Generation of Temperatures below 1°K., 349
Physical Society (American) : Annual Meeting, 653
Physical, Chemical and Biological Methods of Study in High Molecular Weight Carbohydrates (Chemical Society Symposium on), 507
Physics : International Spring School of (Istituto di Fisica Teoretico of the University of Naples), 893
Physics, Institute of (Electronics Group and the Radio Spectroscopy Group) : Conference on Solid State Microwave Amplifiers, 507
Physics, Institute of (X-Ray Analysis Group) : Spring Conference (The Borders of X-Ray Analysis), 356
Physics, Institute of (Electron Microscopy Group), (Royal Microscopical Society and the) . Discussion on Co-ordination of Light and Electron Microscopy, 660
Physics (*Contemporary*), Nos. 1 and 2, 658
Physics (Experimental), at Liverpool, 284
Physics (Health) (Radiation Protection) : Summer School of (Imperial College of Science and Technology, London), 815
Physics (Plasma), and Thermonuclear Research, 891
Physics (Theoretical), at St. Andrews, 430
Physics and Heat Technology of Reactors (translated from the Russian), Supplement No. 1 of the Soviet Journal of Atomic Energy, *Atomnaia Energiia*, *review* by Prof W. Murgatroyd, 4
Physiological Age of Codling Moth Females (*Cydia pomonella* L.) caught in Bait and Light Traps (P W. Geier), 709
Physiological Examination of a Live Whale (Dr. John W. Kanwisher and Dr. Alfred W. Senft), 13
Physiological Mechanisms concerned in the Maintenance of Lactation in the Goat and Sheep (R. Denamur and J. Martinet), 252
Physiology at Bedford College, London, 656
Physiology at Oxford, 733
Physiology of Reproduction, *review* by Sir John Hammond, 492
Physiology (Parasite) : Host Influence on (Bureau of Biological Research Conference on), 897
Physiology (Plant), in the Field, *review* by W. Tutin, 799
Physiology and Biochemistry . 'B.D.S ', *review* by Prof. D. C Harrison, 719
Textbook of (Prof. George H. Bell, Prof. J. Norman Davidson and Prof. Harold Scarborough), fourth edition, *review* by Prof. D. C. Harrison, 719
Phytate (Dietary), as a Possible Cause of Magnesium Deficiency (Dr. A. Heulwen Roberts and Prof. John Yudkin), 823
Picknett, Dr. R G. : Aerodynamic Capture of Particles (Measurement of the Pick-up by a Single Water Drop on which Small Particles Impacted), 665
Picric Acids (Glacial Acetic and), as a Fixation for Gel Precipitation (Dr. Bengt Bergrahm), 242
Pictorial History of Philosophy (Dagobert D. Runes), *review* by Gerd Buchdahl, 67
Pierson, Dr. D. H. (Bryant, Dr. F. J., and) : Radioactive Materials and the Skeleton (Strontium-90 in the Environment and in Human Bone), 808
Pihl, A. (Henriksen, T , and) : Electron Paramagnetic Resonance Observations on Irradiated Thiols and Disulphides, 307
Pillans, Helen, and others : Elementary Astronomy, *review* by Dr. R. H. Garstang, 130
Pineal Gland (Rat) . Histochemical Evidence of Aminopeptidase Activity in (Dr. Mikko Niemi and M. Ikonen), 928
Pinnotherid Crab : Abbreviated Development in a (Dr. I. Goodbody), 704
Pinus nigra var *austriaca* . Differentiation induced as Season Advances in the Embryo-Gametophyte Complex of, using Indole Acetic Acid (Prof. Norman W. Radforth and Dr. J. M. Bonga), 332
Pioneer 5, 810
Pipes (Simple) Cavity Formation in, due to Rupture of the Water Column (B B. Sharp), 302
Pippard, Dr. A. B. : Electron–Phonon Interactions in Solids (Theoretical Treatment of the Anomalous Absorption of Ultrasonic Waves by Conduction Electrons when the Metal is situated in a Magnetic Field), 586
Pirie, N W. . Water Hyacinth—a Curse or a Crop ?, 116
Pitch Discrimination in Orthoptera (Insecta) demonstrated by Responses of Central Auditory Neurones (Dr. G. A. Horridge), 623
Pitfall in High Specific Activity Tracer Studies (Dr. E. Hell, Dr. R. J. Berry and Dr L. G. Lajtha), 47
Pitney, W R., and Elliott, M. H. : Plasma Antihaemophilic-Factor Concentrations in the Australian Aborigine and in Conditions associated with Hyperglobulinaemia, 397
Pitt, Frances : Non-Indigenous Animals of Great Britain, *review*, 799
Pitt-Rivers, Dr. Rosalind, and Tata, Jamshed R : The Thyroid Hormones, *review* by Prof. F. G. Young, 721
Pittard, A. J. (Doy, Dr. C. H , and) : Feedback Control of Tryptophan Biosynthesis, 941
Pituitary of *Myxine glutinosa* (A. J Matty), 180
Pituitary (Elasmobranch) : A Neurohypophyseal Principle in the (Dr. A. M. Perks, Dr. M H I. Dodd and Dr. J. M. Dodd), 850
Pituitary Thyrotropic Fractions Neutralization of Human Serum and, with Antisera to Bovine Pituitary Thyrotropin (Dr. Sidney C. Werner, Ephraim Otero-Ruiz, Beatrice C. Seegal and Robert W. Bates), 472
Pituitary Thyrotropin (Bovine) : Neutralization of Human Serum and Pituitary Thyrotropic Fractions with Antisera to (Dr. Sidney C. Werner, Ephraim Otero-Ruiz, Beatrice C. Seegal and Robert W. Bates), 472
Pituitary Transplants (Functional), in Rats (Dr. P. N. Martinovitch and D. Pavić), 155
Pizer, Dr N. H. . Appointed senior advisory officer in the National Agricultural Advisory Service, 504 ; work of, 504
Placebo Effects (Pharmacodynamic and), in Drug Evaluations in Man : Interactions between (Dr. Walter Modell and Dr. Margaret Garrett), 538
Placental Grafts in Rats (Dr. J. M. Payne and Dr. Sylvia Payne), 402
Placental Trophoblast . Origin of (Dr. Israel Gordon), 118
Planes (Layer), of Artificial and Natural Graphites : X-Ray Measurement of Thermal Expansion Perpendicular to the (E G. Steward and B. P. Cook), 78
Planetary Sciences : Planning Committee on (American Geophysical Union of the United States National Academy of Sciences), 658
Planktonic Photophores · A Possible Function of (John S. Colman), 112
Planning in Science (Czecho-Slovak Union of Scientific Workers International Symposium on), 738
Plant Cells : Occurrence of an Organ-Specific Antigen associated with the Microsome Fraction of, and its Possible Significance in the Process of Cellular Differentiation (Dr. S. T. C. Wright), 82
Plant Communities : Association-Analysis in (D. J. Harberd), 53
Plant-Growth Response . Magnetotropism, a New (Prof. L. J Audus), 132
Plant Physiology in the Field, *review* by W. Tutin, 799
Plant Roots : Calcium–Lithium Competition in Absorption by (Emanuel Epstein), 705
Cell-Growth of, Inorganic Salts and Native Serum Proteins (Dr. Folke Rønnike), 151
Plant Thioglycosides and the Problem of Endemic Goitre in Australia (H. S. Bachelard and Prof V. M. Trikojus), 80
Plant–Animal Food Cycles in the Sea (J. H. Steele), 218
Plants : Nitrogen Metabolism in (Prof. George C. Webster), *review* by Dr. G. Bond, 415
Relation of Sugar Content to Frost-Hardiness in (Dr. Akira Sakai), 698
Plants in Arid and Semi-Arid Conditions · Water Relationships of (Unesco Symposium on), 435
Plants grown in Simulated Pond, Wet Meadow and Irrigated Field Environments Accumulation of Caesium-137 by (Dr. R. C. Pendleton and Dr. R. L. Uhler), 707
Plants and Environment (Prof. R. F. Daubenmire), second edition, *review* by W. Tutin, 799
Plants (Fresh) : Antithyroidal Effects of some, on Guinea Pigs (Dr. P. Langer), 174
Plants (Growing) : Response of, to a Uniform Daily Rotation (R. L. Jones), 775
Plants (Woody) : Survival of the Twig of, at -196°C. (Dr. Akira Sakai), 393
Plaskett, Prof. H. H. : Retirement as Savilian professor of astronomy and director of the University Observatory at Oxford, 733 ; work of, 733
Plasma of the Loggerhead Turtle and Toxin of the Portuguese Man-of-War : Interaction between the (Dr. Eleanor Dodge Wangersky and Prof. Charles E. Lane), 330
Plasma Antihaemophilic-Factor Concentrations in the Australian Aborigine and in Conditions associated with Hyperglobulinaemia, (W. R. Pitney and M. H. Elliott), 397
Plasma Enzymes in the Rabbit : Effect of Salicylate on the Activity of (I. Janota, C. W. Wincey, M. Sandiford and Dr. M. J. H. Smith), 935
Plasma Erythropoietin in Polycythaemia Secondary to Renal Disease (R. W Payne, N. F Jones and R. D. Hyde), 549
Plasma-Level of Chloride : Variations in the, in Hatchery-reared Yearling Atlantic Salmon during Parr–Smolt Transformation and following Transfer into Sea-Water (Prof. Arthur H. Houston), 632
Plasma Physics and Thermonuclear Research, 891
Plasma Rings : Experiments with (L. Lindberg, E. Witalis and C. T. Jacobsen), 452
Plasma (Blood), *in vivo* : Presence of 5-Hydroxytryptamine after Raunescine in (Dr. N. T. Karki and Dr. N. K. Paasonen), 109
Plasma (Ox) . Methylglyoxal Formation from Aminoacetone by (Dr. W. H. Elliott), 467
Plasmin · Action of Antibodies and, on Ehrlich Ascites Tumour Cells (Dr. I. Ginsburg and M. Ram), 328
Plasminogen : Activation of, by Staphylokinase (Dr. Flora M. Davidson), 626
Plasmodium berghei · Auto-Antibody in Rats with (Dr. Avivah Zuckerman), 189
Plastic Crystals and Rotation in the Solid State (Office of Ordnance Research United States Navy Symposium on), 356
Plastics · Toxicity of (Dr. S. F. Chancellor), 841
Platelets : Effect of Cardiac Glycosides and Inorganic Ions on Binding of Serotonin by (Herbert Weissbach, Betty G. Redfield and Elwood Titus), 99
Platinum Medal for 1960 of the Institute of Metals awarded to Prof. Robert Franklin Mehl, 735
Platinum Metals : Phosphides of the (Stig Rundqvist), 31
Platts, Dr. Margaret M. : Appointed lecturer in medicine at the University of Sheffield, 737
Plessner, K. W , and West, R. : Dielectric Devices (Influence of the Chemical Composition of High Permittivity Ceramics upon their Electrical Properties), 361
Pleuropneumonia-like Organisms : Decontaminating Tissue Cultures infected with (Dr Leonard Hayflick), 783
Plexiform Zone and Shape Recognition in the Octopus (Dr. J. A. Deutsch), 443
Plommer, Dr. Hugh · Mycenaean and Classical Greece, *review*, 493
Pluviomètres · Sur le Comportement des (Dr. L. Poncelet), 438
Pode, Sir Julian . Appointed a member of the Commonwealth Scholarship Committee in the United Kingdom, 505
Poison (Stomach) : Time of Feeding in relation to the Toxicity of a, to the Desert Locust (R. D MacCuaig and W. S. Watts), 335
Poisoning by Polymerizable Radioelements . Chelating Agents in the Treatment of (Jack Schubert and Joan F. Fried), 551
Polanyi, Prof. Michael : Beyond Nihilism (Eddington Memorial Lecture for 1960), 146
Polarographic Society Resignation of W J. Parker as secretary, 14
Co-option of J. H Glover as secretary, 14

Polgár, Dr. L. (Dénes, Dr. G., and) : Effect of Nitroacridine 3663 on Synthesis of Deoxyribonucleic Acid and Multiplication of T_2 Phage, 386
Policy (Foreign), in the United States : Science and, 584
Politics : Television and (Edward R. Murrow), (British Association Granada Lectures on Communication in the Modern World), *review* by B. Silcock, 130
Pollard, Dr. William G. : Chance and Providence—God's Action in a World governed by Scientific Law, *review* by the Rev. Dr. E. L. Mascall, 875
Poller, Dr. L. : Pathogenesis of Thrombosis, 937
Poly (methyl methacrylate) : Surface Characteristics of Fractured (Dr. James P. Berry), 91
Poly-L-Tyrosine : Optical Rotation and Configuration of (Dr. James D. Coombes, Dr. E. Katchalski and Prof. Paul Doty), 534
Polycythaemia Secondary to Renal Disease : Plasma Erythropoietin in (R. W. Payne, N. F. Jones and R. D. Hyde), 549
Polymer (High) Forum : Ninth Canadian (Prof. K. E. Russell), 358
Polymères : Effets des Rayonnements de grande énergie sur les (A. Charlesby), *review* by Dr. W. Anderson, 202
Polymérisations amorcées par les Radiations ionisantes (A. Chapiro et M. Magat), *review* by Dr W. Anderson, 202
Polymerizable Radioelements : Chelating Agents in the Treatment of Poisoning by (Jack Schubert and Joan F. Fried), 551
Polymerization of Pyrroles : Formation of I- and III-Type Porphyrins by the (E. Bullock, Prof A. W. Johnson, E. Markham and K. B. Shaw), 607
Polymers with Unsaturated Compounds : Effect of High-Energy Radiation on Mixtures of Vinyl or related (B. J. Lyons), 604
Polypeptide Derivatives (Synthetic), with Anti-Bacterial Activities (Dr. K. Kovács, Dr A. Kótai and Dr. I. Szabó), 266
Polypores with Phosphorus-32 : Metabolism of (Prof. S. R. Bose and P. Bonet-Maury), 828
Polysaccharide Composition of Leaves (P. Andrews, Dr. L. Hough and B Stacey), 166
Polysaccharides (Bacterial), containing Sialic Acid : Chemical and Serological Relationships of certain (Prof. Guy T. Barry, Tien-Hu Tsai and Francis P. Chen), 597
Polysaccharides (Capsular), from Thirteen Strains of *Cryptococcus neoformans* : Infra-Red Spectra of (Dr. H. Gadebusch), 610
Polystyrene (Isotactic) : Nuclear Spin Resonance Spectrum of (Dr. R. J. Kern and Dr. J. V. Pustinger), 236
Pommer, Dr. A. M., and Carroll, Dr. D. . Interpretation of Potentiometric Titration of H-Montmorillonite, 595
Poncelet, Dr. L. : Sur le Comportement des Pluviomètres, 438
Pond (Simulated), Wet Meadow and Irrigated Field Environments : Accumulation of Caesium-137 by Plants grown in (Dr. R. C. Pendleton and Dr. R L. Uhler), 707
Ponderosa Lemon : Flavonoids of the (Robert M. Horowitz and Bruno Gentili), 319
Pontifical Academy of Sciences and the Vatican Observatory (sponsored by the) : Proceedings of the Conference on Stellar Populations, 1957 (edited by D. J K. O'Connell), *review* by Prof. R. O. Redman, 412
Poole, Dr M. J., and Rae, Dr. E R : The Harwell Neutron Project, 280
Pope, J H : Effect of Latitude on the Diurnal Maximum of 'Dawn Chorus', 87
Pope, J H., and others : Rare Hiss, Earth Currents and Micropulsations on November 27, 1959, 231
Pope, Dr. M. (Kallmann, Dr. H., and) : Surface-controlled Bulk Conductivity in Organic Crystals, 753
Popják, Dr G., and others . Stereospecificity of Enzymic Reactions involving Mevalonic Acid, 923
Popular Expositors : Galileo and Euler as, *review* by L. Roth, 717
Populations : Stellar—Proceedings of the Conference sponsored by the Pontifical Academy of Sciences and the Vatican Observatory, 1957 (edited by D. J. K. O'Connell), *review* by Prof. R. O. Redman, 412
Populations of the River Crab, *Potamon* (*Potamonautes*) *perlatus* (M. Edw.), in Rhodesian Trout Streams . Quantitative Estimations of (Peter St. J. Turnbull-Kemp), 481
Porous Models : Optical Scanning of Liquid Concentration in Flow Studies with (Dr. E. R. Deutsch), 675
Porphyra tenera . Preparation of Crystalline Cytochrome$_{553}$ from (Eijiro Yakushiji, Yasutomo Sugimura, Ichiro Sekuzu, Ichiro Morikawa and Prof. Kazuo Okunuki), 105
Porphyrin Biosynthesis in the Leucocyte (B. Cullity and Prof A. Vannotti), 187
Porphyrin Production of *Mycobacterium tuberculosis avium* : Influence of Cobalt and Zinc Ions on the Growth and (Dr. D. S. P. Patterson), 57
Porphyrins (I- and III-Type) : Formation of, by the Polymerization of Pyrroles (E Bullock, Prof A. W. Johnson, E. Markham and K. B. Shaw), 607
Porter, Prof. G., and others : Spectrum of Delayed Fluorescence in Phenanthrene Vapour—a Criterion of Purity, 917
Porter, Dr. J W. G : Applied Microbiology, *review*, 565
Porter, K. A. : Runt Disease and Tolerance in Rabbits, 789
Porterfield, Dr J. S. : Evolution of Arborvirus Diseases, 742
Portuguese Guinea : A Survey of Abnormal Haemoglobins in (Prof Carlos Trincao, L. T. de Almeida Franco and Alfredo R. Nogueira), 326
Portuguese Man-of-War Interaction between the Plasma of the Loggerhead Turtle and Toxin of the (Dr Eleanor Dodge Wangersky and Prof Charles E. Lane), 330
Position of the Proximal Centriole in Flagellate Spermatozoa (Prof. J. Bronte Gatenby and R. S. Mathur), 861
Possible Cause of Magnesium Deficiency : Dietary Phytate as a (Dr. A. Heulwen Roberts and Prof. John Yudkin), 823
Possible Function of Planktonic Photophores (John S. Colman), 112
Possible Relationship between Nucleic Acid Metabolism and the Initiation of Zygospores of *Rhizopus sexualis* (P. M. Hepden and Dr. B. F. Folkes), 254
Possible Significance in the Process of Cellular Differentiation : Occurrence of an Organ-Specific Antigen associated with the Microsome Fraction of Plant Cells and its (Dr. S. T. C. Wright), 82
Post Office (General) : Engineering-Apprenticeship Scheme, 146
Postganglionic Parasympathetic Nerve Endings : Is there a Leak of Acetylcholine from ? (Prof. N. Emmelin), 297
Postgraduate Diploma Course in Conservation at University College, London, 814
Postgraduate Medical Federation (British) : Lectures on the Scientific Basis of Medicine, Vol. 7, 1957-58, *review* by Prof. R. A. McCance, 202
Postgraduates · Scientific Medicine for, *review* by Prof. R. A. McCance, 202
Post-Harvest Urea Sprays : Nitrogen Feeding of Apple Trees by (Dr. K. Oland), 857
Post-Mortem on Groundnuts ?, *review* by Dr. Kenneth Mellanby, 564
Potamon (*Potamonautes*) *perlatus* (M. Edw), in Rhodesian Trout Streams : Quantitative Estimations of Populations of the River Crab (Peter St. J. Turnbull-Kemp), 481
Potassium : Effect of, on Muscle Tension, especially on that of Vascular Muscle (Prof. L. Laszt), 696
  Retention of, by Human Erythrocyte Ghosts (Dr. J. F. Hoffman, Dr. D. C. Tosteson and Dr. R. Whittam), 186
Potassium (Intracellular), in Dietary Liver Necrosis (A E. M. McLean), 936
Potassium Concentrations (Low External) : Resting Potentials in Isolated Frog Sartorius Fibres at (Dr. Roderick P. Kernan), 471
Potassium Fluxes (Salicylate and), of Rat Diaphragm (Dr. J. A Hicklin), *errata*, 215
Potassium Rhenium Hydride : Evidence for the Existence of a, and its Bearing on the Nature of the (—1)-Oxidation State of Rhenium (A. P. Ginsberg, J. M. Miller, J. R. Cavanaugh and B. P. Dailey), 528
Potassium–Argon and Rubidium–Strontium Ages of some Granites from Britain and Eire (Prof. J. L. Kulp, Dr. L. E. Long, C. E. Giffin, Dr. A. A Mills, Dr R StJ. Lambert, Dr. B. J. Giletti and Dr. R. K. Webster), 495
Potato Wart Disease, *Synchytrium endobioticum* (Schilb.) Perc. (Vit Bojnansky), 367
Potency of Parenteral Vitamin A (Dr. J. W. Millen and Dr. D. H. M. Woollam), 249
Potential (Zero Charge), of Metals : Corrosion Inhibition and the (Dora M. Brasher), 838
Potential Energy (Gravitational) : An Expanding Earth with Loss of (Prof. A. E Beck), 677
Potentials (Resting), in Isolated Frog Sartorius Fibres at Low External Potassium Concentrations (Dr. Roderick P. Kernen), 471
Potentiating Principles (Hypnotic) : Separation of the, from the Essential Oil of *Acorus calamus* L. of Indian Origin by Liquid–Gas Chromatography (Ross M. Baxter, P. C. Dandiya, S. I. Kandel, A. Okany and Prof. G. C Walker), 466
Potentiometric Titration of H-Montmorillonite : Interpretation of (Dr. A. M. Pommer and Dr. D. Carroll), 595
Potsherds (Ancient Roman) : Neutron Activation Analysis of (V. M. Emeleus and G. Simpson), 196
Pottery (Romano-British): Spectrographic Analysis of (E. E. Richards and K. F. Hartley), 194
Poulsen, H. E., and others : Fibrinolytic Activity of Cirrhotic Liver, 619
Pound, Prof. : Experiments to Test Einstein's Principle of Equivalence, 654
Powell, D. A. : The α- and β-Forms of Calcium Sulphate Hemihydrate, 375
Powell, Dr. D W. . Geological Implications of Recent Geophysical Work in the British Isles, 739
Powell, H. T. : *Elminius modestus* Darwin on the Isle of Cumbrae (Firth of Clyde), 119
Power (Nuclear) : Chemistry of (Dr. J. K. Dawson and Dr. G. Long), *review* by Prof W. Murgatroyd, 4
Power Conference (World) : Programme of the Madrid Sectional Meeting, 507
Power Plant : Nuclear (E. Openshaw Taylor), *review* by Prof. W. Murgatroyd, 4
Power Technology : Nuclear, *review* by Prof W. Murgatroyd, 4
Powerful Adrenergic Neurone-blocking Agents related to Choline 2,6-Xylyl Ether Bromide (A L A Boura, G. G. Coker, F. C. Copp, W. G Duncombe, A. R Elphick, A F. Green and A. McCoubrey), 925
Poynton, F. Y. (Smyth, Dr C. N., and) : Awarded a grant of £6,000 from the Paul Instrument Fund (in supplement of a previous grant), for the construction of an ultrasonic microscope, 504
Practice : Biochemical, *review* by Dr. D. T. Elmore, 797
Precipitate in Immunoelectrophoresis : Shape of the (Dr. Jan Hirschfeld), 164, *erratum*, 507
Precipitation (Gel) : Glacial Acetic and Picric Acids as a Fixation for (Dr. Bengt Bergrahm), 242
Precipitin (Serum), to Brain Ganglioside : Demonstration of (Dr. Samuel Bogoch), 392
Precis of Progress in Biochemistry, *review* by Dr. F. H. Malpress, 565
Prediction of Academic Success in the Queen's University of Belfast : An Audit of Academic Performance—a Study of the (Michael Forster), 218
Preference (Salt), in Rats · Food Restriction and (Hans Kaunitz, Lester M. Geller, Charles A Slanetz and Ruth E. Johnson), 350
Pregnant Ewes' Urine · 17-Oxosteroids of (Dr. W. F. Coulson), 612
Pregnant Women : Isolation of 17-*Epi*oestriol from the Urine of (Dr. H. Breuer), 613
Prehistory of Southern Rhodesia, *review* by Dr. Revil Mason, 65
Pre-Irradiated Yoshida Sarcoma : Radiosensitivity of the (Dr. Koichi Kaneta and Prof. Nobuyoshi Muta), 858
Pre-mensural Sciences : A Proposal to replace Belief by Method in the (C. C. L. Gregory), 124
Preparation of Crystalline Cytochrome$_{553}$ from *Porphyra tenera* (Eijiro Yakushiji, Yasutomo Sugimura, Ichiro Sekuzu, Ichiro Morikawa and Prof. Kazuo Okunuki), 105
Preparation of Radiochemically Pure Tritium Nuclear-labelled Morphine (Anand L. Misra and Prof. L A. Woods), 304
Preparation of Ultra-Thin Sections of Mineralized Human Enamel (R. W Fearnhead), 550
Preparation and some Properties of a Soluble Ribonucleic Acid in Yeast (Eiko Otaka and Syozo Osawa), 921
Preparation (Tissue) · Effects of the Method of, on the Assay of Tissue Enzyme Activities (Dr. Sjoerd Bonting and Ira M Rosenthal), 686
Preparations · Biochemical (edited by Carl S. Vestling), Vol. 6, *review* by Dr. D. T. Elmore, 797
Preparations (Human γ-Globulin) : Changes in Outdated (F. Skvařil), 475
Presence of Aldosterone-stimulating Hormone in Urine (Dr. E. J. Ross, E. K. McLean and G. R. Miller), 540
Presence of *Aphelenchoides cocophilus* in the Roots of *Cocos nucifera*, the Coconut Palm (Dr. D. W. Fenwick and S B. Maharaj), 259
Presence of Carbohydrates and other Organic Compounds in Ancient Sedimentary Rocks (J. G. Palacas, F. M. Swain and Prof. F. Smith), 234

Presence of 5-Hydroxytryptamine after Raunescine in Blood Plasma *in vivo* (Dr. N. T. Kärki and Dr N. K. Paasonen), 109
Presence of Metals in Biological Materials : A Simple Test for the (Dr. C Milstein), 386
Presence of Metanephrine and Normetanephrine in Normal Human Urine (Elwood H LaBrosse and Jay D Mann), 40
Presence of 3-Methoxy-4-hydroxyphenylglycol and Metanephrine in Phaeochromocytoma Tissue (Dr. Irwin J Kopin and Dr. Julius Axelrod), 788
Presence of Sialic Acid in Connective Tissues (A. A. Castellani, G. Ferri, L. Bolognani and V. Graziano), 37
Presentation (Cathode-Ray), of Chromatograms (R. P. W Scott), 312
Preservation of Rural England, Council for the : Report for 1958-59, 580
Preserving the Amenities of Great Britain, 580
Presnell, R I., and others Observed Characteristics of an Ultra-High-Frequency Signal Traversing an Auroral Disturbance, 510
Pressure Vessels : Nuclear Reactor Containment Buildings and (Department of Mechanical, Civil and Chemical Engineering, Royal College of Science and Technology, Glasgow, Symposium on), 660
Preston, Prof. R D. (Belford, D. S., and) . Copper–Cellulose Complexes, 911
Prestwich Medal of the Geological Society of London awarded to Sir Vivian Fuchs, 657
Pretty, Dr. W. E. : Appointed first director of a new Department of Research and Development Services in the Royal Naval Scientific Service, 578 , work of, 578
Preventing Evaporation from Reservoirs (W. W. Mansfield), 581
Preventive Medicine at Sheffield, 12
Price, Shirley A. P , and West, Dr. G. B. : Distribution of Tryptophan in the Brain, 470
Priester, Dr. W. (Martin, H. A., and) : Measurement of Solar and Diurnal Effects in the High Atmosphere by Artificial Satellites, 600
Primary Education—Suggestions for the Consideration of Teachers and Others concerned with the Work of Primary Schools (Ministry of Education), *review*, 877
Primer (Deoxyribonucleic Acid) : Incorporation of Tritium-labelled Thymidine and Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid after Irradiation of the, with γ-Rays (Dr. S. Okada), 193
Primula Seed Incompatibility in (Prof D. H. Valentine and Dr. S. R J. Woodell), 778
Principessa Tedesca : Lettere a una (Leonhard Euler), (a cura di Gianfranco Cantelli), *review* by L. Roth, 717
Principle of Equivalence : Experiments to Test Einstein's (Dr. T. E. Cranshaw and Dr. J. P. Schiffer), 653
Principle (A Neurohypophyseal), in the Elasmobranch Pituitary (Dr. A. M. Perks, Dr. M. H. I Dodd and Dr. J. M. Dodd), 850
Principles of Organic Chemistry (Prof. T. A. Geissman), *review* by Dr. C. B. Reese, 131
Principles (Hypnotic Potentiating) : Separation of the, from the Essential Oil of *Acorus calamus* L. of Indian Origin by Liquid–Gas Chromatography (Ross M. Baxter, P. C. Dandiya, S. I. Kandel, A. Okany and Prof G. C Walker), 466
Problem : The Atlantic Eel (Dr. C. L. Deelder), 589 ; (Dr. Denys W. Tucker), 591
Problem of Endemic Goitre in Australia : Plant Thioglycosides and the (H. S. Bachelard and Prof V. M. Trikojus), 80
Problems (Stability), in Hydrodynamics (American Mathematical Society Symposium on), 215
Problems (Taxation) : Industrial Research Associations—Some, 63
Procedure (Feeding) : Decrease of the Radioactive Content of Milk by a (Dr. Robert H. Fetner and Dr. Randall W. Carter), 858
Process : Effects of Starvation on the Ability of Isolated Rat Diaphragm to Incorporate Labelled Amino-Acids into its Protein and to Respond to the Influence of Insulin on this (Dr. K. L. Manchester), 907
Process of Cellular Differentiation : Occurrence of an Organ-Specific Antigen associated with the Microsome Fraction of Plant Cells and its Possible Significance in the (Dr. S. T. C Wright), 82
Processes (Electrode), at the Dropping Mercury Electrode Influence of Nitrogen-containing Bases on the Rate of the (V. Volková), 743
Processing : Mineral (Institution of Mining and Metallurgy International Congress on), 893
Production : Antibody (Dr. Stephen V Boyden), 724
Production of Encephalomyocarditis Virus . Role of Infective Nucleic Acid in the (Dr. F. K. Sanders), 802
Production in the Sea : On the Nature of (Dr. D. H. Cushing), 218
Production and Consumption in Great Britain (Prof. R J. Sarjant), 896
Production (Antibody) . Effect of Cytotoxic Agents on (Dr. M. C. Berenbaum), 167
Production (Porphyrin), of *Mycobacterium tuberculosis avium* : Influence of Cobalt and Zinc Ions on the Growth and (Dr. D. S. P. Patterson), 57
Products : Cellulose Pulp and Allied (Dr. Julius Grant), *review* by Dr. F. Lyth Hudson, 646
Products of Decomposition of Lead Azide (M. Stammler, J. E. Abel and J. V R Kaufman), 456
Products (Fermentation), of *Acetobacter aceti* on Ehrlich's Ascites Tumour Cells : Activity of a Substance extracted from the (G. A. Lanzani and A. Pecile), 175
Products (Pyrolytic) : Identification of the Structure of Non-volatile Organic Substances by Gas Chromatography of (Dr. Jaroslav Janák), 684
Products (Radioactive Fission), in Lungs (Dr. T Schonfeld, K. Liebscher, F. Karl and Christina Friedmann), 192
Products (Violinoid), of Oxidation of *d*-Urobilin (Prof. C. H. Gray and D. C. Nicholson), 380
Professional Engineers in Britain, 5
Professional Engineers : The Making of (Sir Willis Jackson), 5
Programming (Automatic), of Digital Computers, National Centre of Information on (Brighton Technical College), 214
Progress in Biochemistry—a Report on Biochemical Problems and on Biochemical Research since 1949 (Prof. Felix Haurowitz), *review* by Dr F. H. Malpress, 565
  Precis of, *review* by Dr F. H. Malpress, 565
Progress of Cancer Research, 500
Progress in Food Investigation (Dr. Francis Aylward), 819
Progress in Microchemistry, 580
Proliferation (Experimentally Induced), of the Rudimentary Gonad of an Intact Domestic Fowl (Prof. W. Kornfeld), 320
Proline and Hydroxyproline Metabolism : Some Interrelated Aspects of (Georg B. Gerber, Gisela Gerber and Kurt I. Altman), 767
Prolonged Exposure to Moderate-Level Radiation : The Shuttle-Box Behaviour of Albino Rats during (Dr. John E. Overall, Dr. W. Lynn Brown and Dr. Loren C. Logie), 665
Prolonged Salt Restriction in Hypertension : Adrenocortical Function after (Dr. Lewis K. Dahl, Dr. Lawrence Silver, Dr. Robert W. Christie and Dr. Jacques Genest), 110
Prolonged Work : Factors in, especially Inspection (Ergonomics Research Society Symposium on), 356, 893
Promotion of Fundamental Research, 715
Propagating Stress-Corrosion Crack : Flow of Electrolyte within a (J M. West), 92
Propagation : Ultrasonic, *review* by Prof. E. G. Richardson, 3
Propagation (Audiofrequency) : Constant Ionosphere Height for (F. Hepburn), 599
Propagation (Tropospheric Radio) : Inadequacy of Scatter Mechanisms in (P C. M. de Belatini), 76
Properties of a Soluble Ribonucleic Acid in Yeast : Preparation and some (Eiko Otaka and Syozo Osawa), 921
Properties (Haemolytic), of Immune Chicken Antibody (Prof. B. D Janković and Dr. K. Isaković), 322
Properties (Mechanical), of Non-Metallic Brittle Materials (edited by W. H. Walton), (Proceedings of a Conference on Non-Metallic Brittle Materials, organized by the Mining Research Establishment of the National Coal Board in consultation with the Building Research Station (D.S.I R.), London, 1958), *review* by Dr David Train, 344
Properties (Optical), of Oxide-coated Metal Surfaces . Exo-electron Emission and the (J A. Ramsey), 602
Properties (Rapid Contractile), of Isolated Mammalian Arteries (C. J. Dickinson), 620
Properties and Solubility of Phenolase in Isolated Chloroplasts (A. M. Mayer and J. Friend), 464
Propionate (Testosterone), and Insulin : Effect of, on Muscle Cholinesterase Activity (A. N Granitsas, N Dede and Dr. A. J Philippu), 320
Proposal to replace Belief by Method in the Pre-mensural Sciences (C. C. L. Gregory), 124
Proposal for the Nomenclature of Free Radicals (F. P. Lossing and Prof. C. A. McDowell), 161
Propulsion (Nuclear) : The Role of, in our Future Merchant Marine (Atomic Industrial Forum, the United States Atomic Energy Commission and the Maritime Administration Conference on), 582
Prospecting and Exploration for Petroleum and Natural Gas : Geochemical Methods of (A. A Kartsev, Z. A. Tabasaranskii, M. I. Subbota and G. A. Mogilevskii), English translation edited by Paul A. Witherspoon and William D. Romey, *review* by Dr. John S. Tooms, 876
Prostatic Homogenates *in vitro* (Human) : Inactivation of Acid Phosphatase in—Role of Calcium (Prof. H. J. Tagnon and A. Steens-Lievens), 48
Protection against Acute Effects of Radiation by Hypoxia (Dr. Patricia J. Lindop and Prof. J. Rotblat), 593
Protection of Nature in the Soviet Republic of Azerbaijan (G. Aliev), 580
Protection (Chemical), against Radiation Damage An Alternative Mechanism for (Prof Mark M Jones), 96
Protection (Crop) . Twelfth International Symposium on (Agricultural College of the University of Ghent), 286
Protection (Radiation) : Summer School of (Imperial College of Science and Technology, London), 815
Protective Antigen of *Trypanosoma brucei* : A Soluble (B G. F. Weitz), 788
Protein : Effects of Starvation on the Ability of Isolated Rat Diaphragm to Incorporate Labelled Amino-Acids into its, and to Respond to the Influence of Insulin on this Process (Dr. K. L. Manchester), 907
Protein of *Mycobacterium* Cell Fractions *in vivo* Effect of Streptomycin on the Incorporation of Tyrosine labelled with Carbon-14 into (Dr. T. Erdos and Dr Agnes Ullmann), 100
Protein synthesized in the Perikaryon of Regenerating Neurons . Proximo-Distal Movement along the Axon of (Dr. N Miani), 541
Protein (Native), an Immunizing Agent against Virus Infection (Dr. G. Loebenstein), 122
Protein (Œstrone—) Conjugates : Antigenicity of (Dr. L Goodfriend and Prof. A H. Sehon), 764
Protein Catabolic Hormone in the Isolated Perfused Rat Liver . Glucagon, a (Prof Leon L. Miller), 248
Protein Dyeing with Bromocresol Green : Scanning of Paper Electrophoretograms after (A. Clark), 243
Protein Moieties (Copper and), of Ceruloplasmin : Turnover of the (Prof. David Gitlin and Charles A. Janeway), 693
Protein Synthesis Cytoplasmic Particles and their Role in (Colloid and Biophysics Committee of the Faraday Society Discussion on), 815
Protein Synthesis in Cell-free Extracts of *Neurospora crassa* : Mediation of the Genetic Control of (S. D. Wainwright), 314
Protein Turnover in an Embryonic System : Evidence for (Dr. Harry R. Walter and Prof. H R. Mahler), 398
Proteins The Nuclear Membrane as a Barrier to the Free Diffusion of (Carl M Feldherr and Ailene B. Feldherr), 250
Proteins of the Biological Fluids (St. Jans Hospital, Bruges, Colloquium on), 14
Proteins in Denervated Muscle : Lack of Correlation between Synthesis of Nucleic Acids and (R Zák and Dr. E. Gutmann), 766
Proteins from Grass (British Glues and Chemicals, Ltd., Report on), 891
Proteins (Native Serum) : Cell-Growth of Plant Roots, Inorganic Salts and (Dr Folke Rønnike), 151
Proteus mirabilis : Intrastrain Transduction in (Prof. J. N. Coetzee and T. G. Sacks), 869
Prothrombin Activation Sequence : Significance of Thrombin E in the (Dr. Walter H. Seegers, Dr. Ricardo H. Landaburu and Dr. J. Frederic Johnson), 930
Proton Synchrotron : The CERN (J. B. Adams), 568
Protopterus : Action of Thyroxine on the Rate of Oxygen Consumption of the Lung-Fish (Dr. T. Mohsen and Dr. R. Godet), 108
Protostrongylus rufescens (The Lungworm), in Australia (A. Korthals and G. Shenman), 941
Protozoa (Rumen) : Isolation of 2-Aminoethane Phosphonic Acid from (Masaaki Horiguchi and Makoto Kandatsu), *erratum*, 146

Providence : Chance and—God's Action in a World governed by Scientific Law (Dr. William G. Pollard), *review* by the Rev. Dr. E. L Mascall, 875
Provision of Animals for Cancer Research (Laboratory Animals Centre Symposium on), 660
Proximal Centriole : Position of the, in Flagellate Spermatozoa (Prof. J. Brontë Gatenby and R. S. Mathur), 861
Proximo-Distal Movement along the Axon of Protein synthesized in the Perikaryon of Regenerating Neurons (Dr. N. Miani), 541
Prunus avium : Effect of Selection on the Frequency of Genotypes determining Incompatibility in (Watkin Williams and J. S Gale), 944
Pruss, M. P., and others · Anaerobic Glycolysis of Dispersed Cell Suspensions from Normal and Malignant Tissues, 315
Pseudopregnant Mice : Implantation of Tissue Transplants in the Uteri of (Ian B. Wilson), 553
Psoas Fibres (Glycerol-extracted) : Effect of Heavy Water on Different Types of Muscle and on (Dr. Benjamin Kaminer), 172
Public Health, Italian Institute of (Istituto Superiore di Sanità), and others : International Symposium on Fermentation, 14
Public Health Laboratory Service in Britain, 505
Publications (Scientific), of South and South-East Asia : Bibliography of (Unesco Science Co-operation Offices for South and South-East Asia), Nos. 7, 8 and 9, 146 , No. 11, 582
Pugh, Sir William : Retirement from the directorship of the Geological Survey of Great Britain and the Museum of Practical Geology, 284 ; work of, 284
Pulp (Cellulose), and Allied Products (Dr. Julius Grant), *review* by Dr. F. Lyth Hudson, 646
Pulp Mill Survey (Small), United Kingdom—Economic Study (Sandwell and Co., Ltd.), (Forestry Commission), 894
Pulsating Autora · Micropulsations in the Earth's Magnetic Field simultaneous with (Dr. W H. Campbell), 677
Pulsations (Auroral Zone Micro-) . Correlation of Audio-Frequency Electromagnetic Radiation with (Dr. J. Aarons, G. Gustafsson and A Egeland), 148
Pulsations (Micro-) on November 27, 1959 : Rare Hiss, Earth Currents and (E. M. Wescott, J. H. Pope, D. O. Dyer and Dr. W. H. Campbell), 231
Pulsations (Micro-) in the Earth's Magnetic Field simultaneous with Pulsating Aurora (Dr W. H Campbell), 677
Pump : Pumping Effect of a Gas Discharge High-Vacuum (Libor Páty), 674
Pumper, Robert W., and others : Multiplication of Vaccinia Virus in Serum-free and Serum-containing Cell Cultures, 123
Pumping Effect of a Gas Discharge High Vacuum Pump (Libor Páty), 674
Purdue University : International Symposium on Growth—Molecule, Cell and Organism, 507
Pure (Radiochemically) Tritium Nuclear-labelled Morphine : Preparation of (Anand L. Misra and Prof. L. A Woods), 304
Pure and Applied Chemistry . Research Diploma for work in (Royal Institute of Chemistry), 285
Purification of Metals by Gas Chromatography (Dr. F. E DeBoer), 915
Purified Human Growth Hormone : Immunochemical Observations on Antisera to (Prof. Melvin M. Grumbach, Dr. Selna L. Kaplan and Dr. Sheila Solomon), 170
Purity : Spectrum of Delayed Fluorescence in Phenanthrene Vapour—a Criterion of (Dr. B. Stevens, E. Hutton and Prof G. Porter), 917
Purvis, Dr. O. N. : Effect of Gibberellin on the Flower Initiation and Stem Extension in Petkus Winter Rye, 479
Pustinger, Dr. J. V. (Kern, Dr. R. J , and) : Nuclear Spin Resonance Spectrum of Isotactic Polystyrene, 236
Pyrazole-4-Carboxylic Acids (I-Substituted) : A New Route to (Dr. D. G. O'Donovan, A. P. Carroll and Prof. J. Reilly), 460
Pyridine Nucleotide (Mitochondrial) : Energy-linked Reduction of (Prof. Britton Chance and Dr. Gunnar Hollunger), 666
Pyrolytic Products : Identification of the Structure of Non-volatile Organic Substances by Gas Chromatography of (Dr. Jaroslav Janák), 684
Pyrroles : Formation of I- and III-Type Porphyrins by the Polymerization of (E. Bullock, Prof. A W. Johnson, E. Markham and K. B. Shaw), 607
Pyrrolizidine Alkaloids : Hepatotoxic Activity of Semi-Synthetic Analogues of (Dr. R. Schoental and Dr. A. R. Mattocks), 842
Pyruvate (2-^{14}C-Sodium), into Glyceride Glycerol : Influence of Insulin on the Incorporation of, in Diabetic and Normal Baboons (N. Savage, Prof. J. Gillman and C. Gilbert), 168
Pyruvic Acid in Man : Clearances of Endogenous α-Ketoglutaric and (Dr. Eman Zelníček), 928

QUALIFICATION : New Research (Royal Institute of Chemistry), 285
Quantitative Estimations of Populations of the River Crab, *Potamon (Potamonautes) perlatus* (M.Edw.), in Rhodesian Trout Streams (Peter St. J. Turnbull-Kemp), 481
Quantitative Immuno-Analysis in Gel Plates (Dr. J. G. Feinberg), 555
Quartz Inclusions in Garnets . Oriented (A. L Harris and Dr. N. Rast), 448
Queen's University, Belfast : Appointment of Dr. A. K Galwey and Dr. B. D. Flockhart as lecturers in physical chemistry, 14
  Appointment of Dr. A Scott as lecturer in zoology, 14
  Appointment of R. Tavener-Smith as lecturer in geology, 14
  Appointment of W. E. Glover as lecturer in physiology, 14
  An Audit of Academic Performance—a Study of the Prediction of Academic Success in the (Michael Forster), 218
  Appointment of Dr D. J. Carr as professor of botany, 812
Question of Artefact : Lipoamino-Acids—the (Dr. J. J. Wren), 295
Questions (Basic), in the Structure of Languages (American Mathematical Society and the Association for Symbolic Logic Symposium on), 215

RAAL, Dr. F. A. : Alleged Formation of an Intermediate Diamond Structure on Heating Diamond, 523
Rabbit : Effect of Foetal Hypophysectomy on the Foetal Liver Fat in the (Dr. J. G. Bearn), 849
  Effect of Salicylate on the Activity of Plasma Enzymes in the (I. Janota, C. W. Wincey , M. Sandiford and Dr. M. J. H. Smith), 935
Rabbits : Effect of Injection of a Hepatotoxin directly into the Gall-Bladder of (Dr. N. A. Worker), 785
  Runt Disease and Tolerance in (K. A. Porter), 789
Rabbits receiving Strontium-90 : Ear Tumours in (Dr. H. A. Sissons and Dr. Janet Vaughan), 399
Rabin, Dr. B. R. (Leberman, Dr. R., and) : Copper(II) Complexes of Histamine and 3-Methyl Histamine, 768
Radforth, Prof. Norman W., and Bonga, Dr. J. M. : Differentiation induced as Season Advances in the Embryo-Gametophyte Complex of *Pinus nigra* var. *austriaca*, using Indole Acetic Acid, 332
Radiation : Protection against Acute Effects of, by Hypoxia (Dr. Patricia J. Lindop and Prof. J. Rotblat), 593
  Resistance of Algae to (Dr. M. B. E. Godward), 706
Radiation (Audio-Frequency Electromagnetic) : Correlation of, with Auroral Zone Micropulsations (Dr. J. Aarons, G. Gustafsson and A. Egeland), 148
Radiation (High-Energy) : Effect of, on Mixtures of Vinyl or related Polymers with Unsaturated Compounds (B. J. Lyons), 604
Radiation (Ionizing) : Effect of, upon Xanthosine in Dilute Aqueous Solution (Dr. G. Hems), 525
Radiation (Moderate-Level) : The Shuttle-Box Behaviour of Albino Rats during Prolonged Exposure to (Dr. John E. Overall, Dr. W. Lynn Brown and Dr. Loren C. Logie), 665
Radiation Carcinogenesis, a New Hypothesis (Dr. P. R. J. Burch), 135
Radiation Damage : An Alternative Mechanism for Chemical Protection against (Prof. Mark M. Jones), 96
Radiation Protection : Summer School of (Imperial College of Science and Technology, London), 815
Radiation Research Group (Environmental) · Established by the Medical Research Council in the Department of Medical Sciences, University of Leeds, 215
Radiations : Actions Chimiques et Biologiques des (Collection dirigée par M Haissinsky), Troisième Série, Radiolyse de Liquides organiques (Milton Burton), Polymérisations amorcées par les Radiations Ionisantes (A. Chapiro et M. Magat), Effets des Rayonnements et grande énergie sur les Polymères (A. Charlesby) ; Quatrième Série, Les Peroxydes organiques en Radiobiologie (R. Latarjet et *al.*), *review* by Dr. W. Anderson, 202
  Chemical and Biological Action of, *review* by Dr. W. Anderson, 202
Radiations (Ionizing) : Organic Hydroxy-Hydroperoxides, a Class of Hydroperoxides formed under the Influence of (Dr. George Scholes and Prof. Joseph Weiss), 305
Radiations ionisantes . Polymérisations amorcées par les (A. Chapiro et M. Magat), *review* by Dr W. Anderson, 202
Radicals (Free) . A Proposal for the Nomenclature of (F. P. Lossing and Prof. C. A. McDowell), 161
Radio Bursts (Solar), and Low-Energy Cosmic-Rays (Dr. A. R. Thompson and Dr. A. Maxwell), 89
Radio Propagation (Tropospheric) : Inadequacy of Scatter Mechanisms in (P. C. M. de Belatini), 76
Radio Research in the D.S.I.R., 353
Radio Research Board : Retirement of Dr. R. L. Smith-Rose as director of radio research, 353
  Appointment of Dr. J. A. Ratcliffe as director of radio research, 354
Radioactive Content of Milk : Reduction of the, by a Feeding Procedure (Dr. Robert H. Fetner and Dr. Randall W. Carter), 858
Radioactive Debris in the Stratosphere : Time of Residence of (J. Ambrosen), 301
Radioactive Fission Products in Lungs (Dr. T. Schonfeld, K. Liebscher, F. Karl and Christina Friedmann), 192
Radioactive Materials and the Skeleton (Bone and Tooth Society Conference on), 807
Radioactive Vitamin B_{12} : Isolation of, from Incubation Mixtures containing Glycine-2-^{14}C and Turkey Liver Homogenates (Pran Vohra and F. H. Kratzer), 45
Radioactive Waste : Disposal of, 1
Radioactive Wastes : Control of, 199
Radioactivity (Natural), of Samarium and Neodymium (M. Karras and Dr. M. Nurmia), 601
Radiobiologie · Les Peroxydes organiques en (R. Latarjet et *al.*), *review* by Dr. W. Anderson, 202
Radiocarbon Activity (Atmospheric), in 1959 (Dr. E. H. Willis), 552
Radiocarbon Dating of Soil Humus (Prof. C. O. Tamm and H. G. Östlund), 706
Radiocarbon Measurements and Annual Rings in Cave Formations (Prof Wallace S. Broecker, Dr. Edwin A. Olson and Dr. Phil C. Orr), 93
Radiochemically Pure Tritium Nuclear-labelled Morphine . Preparation of (Anand L. Misra and Prof. L. A. Woods), 304
Radioelements (Polymerizable) : Chelating Agents in the Treatment of Poisoning by (Jack Schubert and Joan F. Fried), 551
Radioisotopes in Medical and Biological Research, *review* by Prof. Otto Hug, 876
Radioisotopes in Scientific Research—Proceedings of the International Conference under the auspices of Unesco, Paris, 1957 (edited by Prof. R. C. Extermann), Vol. I, Research with Radioisotopes in Physics and Industry , Vol. 2, Research with Radioisotopes in Chemistry and Geology, *review* by Dr. H. Seligman, 415 ; Vol. 3, Research with Radioisotopes in Human and Animal Biology and Medicine ; Vol. 4, Research with Radioisotopes in Plant Biology and some General Problems, *review* by Prof Otto Hug, 876
Radiolyse de Liquides organiques (Milton Burton), *review* by Dr. W. Anderson, 202
Radiophosphorus Metabolism in Salmon : Thyroidal Control of (P. N. Srivastava), 621
Radiophysics and Space Research : Cornell University Center for (Dr. J. A. Ratcliffe), 77
Radiosensitivity of the Pre-Irradiated Yoshida Sarcoma (Dr Koichi Kaneta and Prof. Nobuyoshi Muta), 858
Radiosensitivity Studies *in vivo* : Estimation of the Cellular Lethal Dose and the Critical Cell Number for the *C3H* Mouse Mammary Carcinoma from (A. Cohen and L. Cohen), 262
Radiostrontium : Effectiveness of Dietary Substances in reducing the Retention of Chronically Ingested—Studies with Tannin (Prof. R. H. Wasserman and Dr. C. L. Comar), 629
Rae, Dr. E. R. (Poole, Dr. M. J., and) : The Harwell Neutron Project, 280

Raimes, Dr. S. : Electron–Phonon Interactions in Solids (Transport Phenomena in Metals using the Techniques of Plasma Theory), 587
Rain-Gauges : Comparison of (G A. Bull), 437
Raistrick, Prof. Harold : Antibiotics from a Novel Angle, *review*, 797
Raja clavata (Elasmobranch) : A Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the, in Terms of Directional Sensitivity (Prof. O. Lowenstein and J. Wersall), *errata*, 76
Ram, M. (Ginsburg, Dr I., and) : Action of Antibodies and Plasmin on Ehrlich Ascites Tumour Cells, 328
Ramalingam, Dr. N. . A Convective-Turbulence Theory of Thunderstorms, 900
Raman, A. . Algology (Algae in Sewage Disposal), 821
Ramm, W J , and others : Global Hydromagnetic Wave Ducts in the Exosphere, 299
Ramot, Dr. Bracha, and others Erythrocyte Glucose-6-Phosphate Dehydrogenase-deficient Subjects—Enzyme-Level in Saliva, 931
Ramsay Memorial Fellowships in Chemistry, 432
Ramsey, J. A. . Exo-electron Emission and the Optical Properties of Oxide-coated Metal Surfaces, 602
Randhawa, Dr M S. : Agriculture and Animal Husbandry in India, *review* by Colin Clark, 414
  Algology (Development of Algal Studies and Lines of Research), 820
Rao, Prof B. Ramachandra (Rao, R Raghava, and) : Horizontal Drifts in the *E*-Region at Waltair, 27
Rao, Dr C. N R , and others : Molecular Structure of Neopentane, 458
Rao, C. S. P. : Algology (Algal Cytology), 820
Rao, R. Raghava, and Rao, Prof. B. Ramachandra : Horizontal Drifts in the *E*-Region at Waltair, 27
Rao, Shri P R. Krishna : Appointed director-general of Observatories, Indian Meteorological Department, 812 ; work of, 812
Rapid Contractile Properties of Isolated Mammalian Arteries (C. J Dickinson), 620
Rapp, Fred, and others : Electron-dense Crystallites in Nuclei of Human Amnion Cells infected with Measles Virus, 790
Rare-Earth Fatty Liver (Dr. Fred Snyder, Edgar A. Cress and Granvil C. Kyker), 480
Rare Hiss, Earth Currents and Micropulsations on November 27, 1959 (E. M. Wescott, J. H Pope, D. O. Dyer and Dr W. H. Campbell), 231
Rashid, A. (Islam, Ahmad Shamsul, and) : First Successful Hybrid between the Two Jute-yielding Species, *Corchorus olitorius* L. (Tossa) x *C. capsularis* L (White), 258
Rasmuson, Marianne, and others : Inheritance of a New Group-Specific System demonstrated in Normal Human Sera by means of an Immuno-Electrophoretic Technique, 931
Rasmussen, J., and others : Fibrinolytic Activity of Cirrhotic Liver, 619
Rast, Dr. N. (Harris, A. L., and) : Oriented Quartz Inclusions in Garnets, 448
Rat : Metabolism of 1-^{14}C Lignoceric Acid in the (Dr. S. Gatt and Dr. B. Shapiro), 461
Rat Cancer : Diathelic Immunization of Sheep against a (Prof. B Sekla and E. Holečková), 618
Rat Diaphragm : Salicylate and Potassium Fluxes of (Dr. J. A. Hicklin), *errata*, 215
Rat Diaphragm (Isolated) : Effects of Starvation on the Ability of, to Incorporate Labelled Amino-Acids into its Protein and to Respond to the Influence of Insulin on this Process (Dr. K. L Manchester), 907
Rat Kidney : Effect of Parathyroid Extract on Citric Acid Concentration in the (A. Komárková, J. Vostál and V Pacovsky), 173
Rat Liver (Isolated Perfused) : Glucagon, a Protein Catabolic Hormone in the (Prof. Leon L. Miller), 248
Rat Pineal Gland : Histochemical Evidence of Aminopeptidase Activity in (Dr Mikko Niemi and M. Ikonen), 928
Rat Skin : Effect of Age on the Heparin Content of (Dr. Sara Schiller and Dr. Albert Dorfman), 111
Rat Thymus Cells : Labelling of Deoxyribose with Carbon-14 in relation to Incorporation of Phosphorus-32 into the Nucleotides of Deoxyribonucleic Acid of (Dr. S. Itzhaki), 614
Ratcliffe, Dr. J A : Cornell University Center for Radiophysics and Space Research, 77
  Appointed director of radio research in the Department of Scientific and Industrial Research, 354 ; work of, 354
Rate of Carbon Dioxide Output of *Periplaneta americana* : A Temperature-dependent Endogenous Rhythm in the (Dr. M B. Wilkins), 481
Rate of the Electrode Processes at the Dropping Mercury Electrode : Influence of Nitrogen-containing Bases on the (V Volková), 743
Rate of Fall-out : Relationship between the, and the Concentration of Strontium-90 in Human Diet in the United Kingdom (Dr. J. D. Burton, G. M. Milbourn and Dr. R Scott Russell), 498
Rate of Oxygen Consumption of the Lung-Fish (*Protopterus*) : Action of Thyroxine on the (Dr. T. Mohsen and Dr. R. Godet), 108
Ratio of Nucleon Mass and Electron Mass (Dr. R L. Worrall), 602
Rationale for Behaviour, *review* by Dr. G. B Ansell and P. B. Bradley, 128
Rats : Early Injury of Chromoexcretion after Total Irradiation of (Zdenek Dienstbier and Oskar Andrysek), 630
  Effect of β-Hydroxybutyrate Injections on the Pancreatic Activity of Guinea Pigs and (Prof. A. Schwartz, J. Manta, J. Madar and Z. Kis), 771
  Food Restriction and Salt Preference in (Hans Kaunitz, Lester M. Geller, Charles A. Slanetz and Ruth E Johnson), 350
  Functional Pituitary Transplants in (Dr. P. N. Martinovitch and D Pavić), 155
  Placental Grafts in (Dr. J M Payne and Dr. Sylvia Payne), 402
Rats maintained on an Atherogenic Diet : Modification of Cholesterosis and Lipidosis of (Dr N. R. Di Luzio), 616
Rats injected with L- or D-Thyroxine : Oxygen Consumption by Tissues from (Dr. P B. Dunne and Dr. D F. Tapley), 622
Rats with *Plasmodium berghei* : Auto-Antibody in (Dr. Avivah Zuckerman), 189
Rats (Albino) : The Shuttle-Box Behaviour of, during Prolonged Exposure to Moderate-Level Radiation (Dr John E. Overall, Dr. W. Lynn Brown and Dr Loren C Logie), 665
Rats (Cold-Stressed) Effects of Reserpine, Serotonin and Vasopressin on the Survival of (R Michel Zilberstein), 249
Rats (Hyperthyroid) : Effect of Adrenaline and Insulin upon the Oxygen Consumption of (R. L Himsworth), 694
Rats (Laboratory) : Failure of Growth in Disturbed (Dr. Hannah Steinberg and R. H J. Watson), 615
Raunescine in Blood Plasma *in vivo* : Presence of 5-Hydroxytryptamine after (Dr. N T. Karki and Dr. N. K. Paasonen), 109
Raw Materials : Important, *review* by Dr F. Lyth Hudson, 646
Rawlins, F. I. G Retirement as scientific adviser and deputy keeper at the National Gallery, London, 656 ; work of, 656
Ray (Cosmic-) Ages : Calculation of, in the Iron Meteorites 'Carbo' and 'Treysa' (Dr. H. Voshage and Dr. H. Hintenberger), 88 ; (Dr. Royal R Marshall), 89
Ray (γ-) Background : Increases in the Local, due to Nuclear Bomb Fall-out (J Vennart), 722
Ray (γ-) Optics : Developments in (Prof. P. B. Moon), 427
Raymond, Raphael, and others . Reduction of Graphite by Lithium–Ethylenediamine, 379
Rayonnements de grande énergie : Effets des, sur les Polymères (A. Charlesby), *review* by Dr. W. Anderson, 202
Rays (Cosmic), at Sea-Level Momentum Spectrum of (F. Ashton, G. Brooke, M Gardener, P. J. Hayman, D. G Jones, S Kisdnasamy, J L. Lloyd, F. E. Taylor, R. H. West and A. W Wolfendale), 364
Rays (Cosmic-) (Low-Energy) Solar Radio Bursts and (Dr. A R Thompson and Dr A. Maxwell), 89
Rays (γ-) . Incorporation of Tritium-labelled Thymidine and Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid after Irradiation of the Deoxyribonucleic Acid Primer with (Dr. S Okada), 193
Reaction of Hibernators to various Low Temperatures of the Environment (Dr Zdenek Bartoš), 251
Reaction (Chemical) Engineering (European Federation for Chemical Engineering second European Symposium on), 507
Reaction (Nagler), of some *Clostridia* . Observations on the (Dr. A. T. Willis), 943
Reactions The Structure of Graphite and the Kinetics of its (Société de Chimie Physique Conference on), 582
Reactions (Some Atomic), by Absorption Spectroscopy (Dr. H P. Broida, Dr. H I Schiff and Dr T M. Sugden), 759
Reactions (Enzymic), involving Mevalonic Acid : Stereospecificity of (Rita H Cornforth, K Fletcher, Hermione Hellig and Dr. G. Popják), 923
Reactions (Immunological): Antigen–Antibody in Liquid Two-Phase Systems—a Method for studying (Per-Åke Albertsson and Lennart Philipson), 38
Reactions (Mild Substitution) : Inactivation of Erythropoietin by Neuraminidase and by (Dr. Peter H. Lowy, Dr. Geoffrey Keighley and Dr. Henry Borsook), 102
Reactions (Oxidation Reduction), in Ionizing Solvents (Faraday Society General Discussion on), 893
Reactions (Substitution), of Cobaltic Complexes catalysed by Adsorption (A. A. Vlček and J Kuta), 95
Reactor (Dounreay) : Graphite Blocks for the (Morgan Crucible Co., Ltd), 76
Reactor (*Herald* Research), at Aldermaston (United Kingdom Atomic Energy Authority), 735
Reactor (Nuclear), for Lucas Heights : A Second, 889
Reactor (Nuclear) Containment Buildings and Pressure Vessels (Department of Mechanical, Civil and Chemical Engineering, Royal College of Science and Technology, Glasgow, Symposium on), 660
Reactor (*Zenith*), at Winfrith Heath : Commencement of Operations (United Kingdom Atomic Energy Authority), 12
Reactor Fuel Element Technology (Imperial College of Science and Technology, London, Course of Lectures on), 215
Reactors . Physics and Heat Technology of (translated from the Russian), Supplement No 1 of the Soviet Journal of Atomic Energy, *Atomnaia Energiia*, *review* by Prof W. Murgatroyd, 4
Read, Prof. H. H : Geological Implications of Recent Geophysical Work in the British Isles, 739
Read, R : Interlaminate Figures of Sessile Barnacle Shells, 778
Reade, Winwood (edited by) : Out of Doors, *review* by B J. C. Maitland, 567
Reader (General) : Evolution for the, *review* by T. H. Hawkins, 65
Reagents (Sulphydryl Group) : Effect of, on Tryptophanase Activity (J. M. Turner and Prof. Frank C. Happold), 763
Rearing (Mass), of Barnacle Cyprids in the Laboratory (John Moyse), 120
Rechinger, Dr K. H : At the meeting of the Flora Europaea Organization in Vienna (Problems of Geographical Distribution and Taxonomy), 16
Reciprocal Relationship of Phosphorylase and Oxidative Enzymes in Skeletal Muscle (Victor Dubowitz and Dr. A G. Everson Pearse), 701
Recognition of Folds and Faults on Rock Surfaces beneath the Sea (A. H. Stride), 837
Recognition (Shape), in the Octopus : The Plexiform Zone and (Dr. J. A. Deutsch), 443
Recombination (Asymmetrical), of Alkali-dissociated Haemoglobin Mixtures (Dr. Elizabeth Robinson and Dr. Harvey A. Itano), 547
Recommendations (River Studies and), on Improvement of Niger and Benue (Nedeco, Netherlands Engineering Consultants), *review* by Prof. W G V. Balchin, 274
Record, B R , and Taylor, R. : Survival of Bacteria on Drying in Sugar/Protein Mixtures, 944
Record (A New), of *Mytilicola intestinalis* Steuer, a Parasitic Copepod of Mussels (J. Wickstead), 258
Recrystallization of Amorphous Copper Sulphate Monohydrate (G. A. Specken and Prof K J McCallum), 758
Red and the White Muscles of the American Cockroach, *Periplaneta americana* L : Spectrophotometric Measurement of Cytochromes in the (Tsutomu Nakatsugawa), 85
Red Cell Agglutination by Stromal Material in Haemolysates (S. B. de C. Baker), 547
Red-Cell Antigens of *Bison bonasus* : Some, as compared to Red-Cell Antigens of Domestic Cattle (Prof. M Czaja and J Gasparski), 184
Red-Cell Antigens of Domestic Cattle : Some Red-Cell Antigens of *Bison bonasus* as compared to (Prof M. Czaja and J. Gasparski), 184
Red Deer and Vegetation in New Zealand (New Zealand Department of Scientific and Industrial Research, Bulletin 135), 742
Reddy, P Jayarama, and Subrahmanyam, S V : Dependence on Temperature of Elastic Moduli of Tin, 29

Redfield, Betty G , and others : Effect of Cardiac Glycosides and Inorganic Ions on Binding of Serotonin by Platelets, 99
Redman, Prof R O. · Stellar Populations, *review*, 412
  Awarded a grant of £3,000 from the Paul Instrument Fund (in supplement of a previous grant), for the construction and testing of a thin astronomical mirror of plate glass and of a new support system, 504
Reducing the Retention of Chronically Ingested Radiostrontium · Effectiveness of Dietary Substances in—Studies with Tannin (Prof. R. H. Wasserman and Dr C L Comar), 629
Reduction of Graphite by Lithium-Ethylenediamine (Raphael Raymond, Leslie Reggel, Waldo A. Steiner, Sabri Ergun and Irving Wender), 379
Reduction of Intestinal Absorption by a Synthetic Chemical (Dr. J. A. Nissim), 222
Reduction of the Radioactive Content of Milk by a Feeding Procedure (Dr. Robert H Fetner and Dr Randall W. Carter), 858
Reduction (Energy-linked), of Mitochondrial Pyridine Nucleotide (Prof. Britton Chance and Dr. Gunnar Hollunger), 666
Reduction (Variety), in Engineering (Borough Polytechnic, London, Course of Lectures on), 286
Reduction Reactions (Oxidation), in Ionizing Solvents (Faraday Society General Discussion on), 893
Rees, Dr. David A. Paper Chromatography of Acidic Carbohydrates, 309
Rees, Dr. W. J The Freshwater Life of the British Isles, *review*, 801
Rees, Dr. W. J (Cox, Dr. L. R , and) : A Bivalve Gastropod, 749
Reese, Dr. C. B. : Principles of Organic Chemistry, *review*, 131
Reeves, P. : Role of *Hfr* Mutants in *F*+ x *F*— Crosses in *Escherichia coli* K12, 265
Refining (Petroleum Chemistry and) : Advances in (edited by Kenneth A. Kobe and John J. McKetta, Jr), *review* by Prof F. Morton, 201
Reflexions (High-Spacing Meridional), in the X-Ray Photograph of Keratin impregnated with Heavy-Metal Salts . Enhancement of the (W. S. Simpson and H. J. Woods), 157
Reflexions (Meridional), in the X-Ray Diffraction Photographs of α-Keratin (W. J Onions, H. J. Woods and P. B. Woods), 157
Reflexions (Oblique Auroral), observed in the Auroral Zone : A Day-time Maximum of (Alv Egeland, Dr Bengt Hultqvist and Johannes Ortner), 519
Refresher Course on Science in Schools (Department of Extra-Mural Studies and Education of King's College, Newcastle-upon-Tyne, in association with the North-Eastern Association of the British Federation of University Women), 286
Regenerating Neurons : Proximo-Distal Movement along the Axon of Protein synthesized in the Perikaryon of (Dr. N. Miani), 541
Reggel, Leslie, and others : Reduction of Graphite by Lithium-Ethylenediamine, 379
Regional Advisory Council for Technological Education, London and Home Counties · Bulletin on Courses in Advanced Technology, 506
Registrar General's Statistical Review of England and Wales for the Year 1955, Supplement on Hospital In-Patient Statistics (General Register Office), 214
Reid, G F. : Awarded the Cuthbert Peek Grant of the Royal Geographical Society, 735
Reiffel, Dr L. : Low-Energy X-Rays from Interplanetary Space, 229
  Erosion of Meteorites in Space and the Density of Interplanetary Gas, 821
Reilly, Prof. J., and others : A New Route to 1-Substituted Pyrazole-4-Carboxylic Acids, 460
Reinwein, Prof. Helmuth : Elected a member of the Internal Medicine Section of the Leopoldina Academy of Sciences, 506
Relation of Eye Dominance and Eye Closure (S. T. Chan and Prof. K. S. F. Chang), 539
Relation of Leydig Cells in the Human Testicle to the Tubules and Testicular Function (J B. W. Halley), 865
Relation of Sugar Content to Frost-Hardiness in Plants (Dr. Akira Sakai), 698
Relationship between the Rate of Fall-out and the Concentration of Strontium-90 in Human Diet in the United Kingdom (Dr. J. D Burton, G. M. Milbourn and Dr. R. Scott Russell), 498
Relationship (A Possible), between Nucleic Acid Metabolism and the Initiation of Zygospores of *Rhizopus sexualis* (P. M. Hepden and Dr. B. F. Folkes), 254
Relationship (Reciprocal), of Phosphorylase and Oxidative Enzymes in Skeletal Muscle (Victor Dubowitz and Dr A. G Everson Pearse), 701
Relationships (Chemical and Serological), of certain Bacterial Polysaccharides containing Sialic Acid (Prof. Guy T. Barry, Tien-Hu Tsai and Francis P. Chen), 597
Relationships (Water), of Plants in Arid and Semi-Arid Conditions (Unesco Symposium on), 435
Release of Iron from Conjugates in Food (Rona Sanford), 533
Release (Spore), In *Peronospora tabacina* Adam. (A V. Hill), 940
Relief (Government), for Scientific Societies, 890
Remains (Fossilized Human), from Northern Kenya (Dr. T. Whitworth), 947
Removal of Fixed Ammonium from Clay Minerals by Cation Exchange Resins (Prof. A. D. Scott, A. P Edwards and Prof J. M. Bremner), 792
Renal Affection resulting from Blood Trauma in Extracorporeal Circuits (Dr. H. S. S Sarajas and Dr. L. Saure), 768
Renal Disease : Plasma Erythropoietin in Polycythaemia Secondary to (R. W. Payne, N. F. Jones and R. D. Hyde), 549
Renkonen, O. -V., and others : Electrophoretic Patterns of Haptoglobins in Apes, 852
Rensselaer Polytechnic Institute : Gift of 1,000,000 dollars from the Jonsson Foundation, to help finance a new Science Centre, 892
Reproduction : Physiology of, *review* by Sir John Hammond, 492
Reproduction in Domestic Animals (edited by H. H. Cole and P. T. Cupps), Vol. 2, *review* by Sir John Hammond, 492
Republic (German Federal) : Research in the, 579
Research : Basic (United States Academy of Sciences, the American Association for the Advancement of Science and the Alfred P. Sloan Foundation Symposium on), (edited by Dael Wolfle), 716
  Pest Infestation—the Report of the Pest Infestation Research Board with the Report of the Director of Pest Infestation Research, 1958 (Department of Scientific and Industrial Research), 78
  Vegetable, 890
Research in the German Federal Republic, 579
Research by McGill University in Barbados, 77
Research in Chemistry . Harrison Memorial Prize for, 14
Research in Dairying, National Institute for : Retirement of Dr. A. T. R. Mattick as deputy chief scientific officer, 11
Research on Diseases on the Blood : Grants, Scholarships and Fellowships for (Lady Tata Memorial Trust), 433
Research on Grouse (Nature Conservancy), 889
Research in the Hat and Feltmaking Industries, 583
Research for Industry, Vol. 11, No. 6, Science and Foreign Policy in the United States, 584
Research and Development, 588
Research and Development in the United States : Funds for (United States National Science Foundation), 813
Research and Industry in Great Britain, 506
Research Associations (Industrial)—Some Taxation Problems, 63
Research Development Corporation (National) : Annual Report for 1958-59, 361
Research Diploma for work in Pure and Applied Chemistry (Royal Institute of Chemistry), 285
Research Fellowship in the Physical Sciences (Central Electricity Generating Board), 286
Research Fellowship (New Zealand National) for 1960 awarded to Dr. R H. Hedley, 356
Research Fellowships in Geomagnetism and Seismology : Gassiot (Meteorological Office), 892
Research Grant (First), under the Exchange and Training Programme of the International Atomic Energy Agency awarded to Dr. R P. Agarwala, 354
Research Grants (Department of Scientific and Industrial Research), 892
Research Methodology at the London School of Economics (Prof. M. G. Kendall), 208
Research Qualification : New (Royal Institute of Chemistry), 285
Research Reactor (*Herald*), at Aldermaston (United Kingdom Atomic Energy Authority), 735
Research Scholarship in the Use of Light Alloys in Structural Engineering (Institution of Structural Engineers and the Aluminium Development Association), 356
Research Study Group to consider the Use of Toxic Chemicals in Agriculture and Food Storage (Appointed by the Minister of Agriculture, Fisheries and Food, with the Minister for Science, the Secretary of State for Scotland and the Minister of Health), 578
Research (Agricultural), in India, *review* by Colin Clark, 414
Research (Agricultural), Indian Council of (Unesco and the) : Symposium on Algology, 820
Research (Basic), in the Navy (Arthur D. Little, Inc., Industrial Bulletin 369), 588
Research (Biological), Bureau of : Sixteenth Annual Conference (Host Influence on Parasite Physiology), 897
Research (Cancer) : Progress of, 500
  Provision of Animals for (Laboratory Animals Centre Symposium on), 660
Research (Dairy), In Scotland (Dr. C. C. Balch), 147
Research (Fundamental) : Promotion of, 715
Research (Galactic) Co-ordination of (International Astronomical Union, Symposium No. 7, Stockholm 1957), (edited by A Blaauw, G. Larsson-Leander, N. G. Roman, A. Sandage, H. F. Weaver and A. D. Thackeray), *review* , 801
Research (High-Atmosphere), in the Meteorological Office, 814
Research (Medical and Biological) : Radioisotopes In, *review* by Prof. Otto Hug, 876
Research (Nuclear), European Organization for : Grant of 500,000 dollars from the Ford Foundation, 146
  The CERN Proton Synchrotron (J. B. Adams), 568
Research (Operations) : Mathematical Methods of (Thomas L. Saaty), *review* by Prof. L. S Goddard, *erratum*, 433
  Mathematics and, *review* by Prof L. S. Goddard, *erratum*, 433
Research (Radio), in the D.S.I.R., 353
Research (Scientific) : Radioisotopes in—Proceedings of the International Conference under the auspices of Unesco, Paris, 1957 (edited by Prof R. C. Extermann), Vol. 1, Research with Radioisotopes in Physics and Industry ; Vol. 2, Research with Radioisotopes in Chemistry and Geology, *review* by Dr. H. Seligman, 415 ; Vol. 3, Research with Radioisotopes in Human and Animal Biology and Medicine ; Vol. 4, Research with Radioisotopes in Plant Biology and some General Problems, *review* by Prof. Otto Hug, 876
Research (Scientific), in Schools : Report of the Committee on (Royal Society), 659
Research (Scientific and Technical), in France . Direction of, 896
Research (Space) : Anglo-American, 657
  Cornell University Center for Radiophysics and (Dr. J. A. Ratcliffe), 77
Research (Thermonuclear) : Plasma Physics and, 891
Reserpine and the Levels of Serotonin and Norepinephrine in the Brain (H. Sheppard and J. H. Zimmerman), 40
Reserpine, Serotonin and Vasopressin : Effects of, on the Survival of Cold-Stressed Rats (R. Michel Zilberstein), 249
Reservoirs : Preventing Evaporation from (W. W. Mansfield), 581
Residence of Radioactive Debris in the Stratosphere : Time of (J. Ambrosen), 301
Resins (Cation Exchange) : Removal of Fixed Ammonium from Clay Minerals by (Prof. A. D. Scott, A. P. Edwards and Prof J. M. Bremner), 792
Resistance of Algae to Radiation (Dr. M B. E. Godward), 706
Resistance (DDT-), in House-Flies : Sex-limited (R. W. Kerr), 868
Resistivity (Electrical), of Age-hardening Alloys : Influence of Guinier–Preston Zones on the (C. W. Morley and B. D. Burns), 914
Resonance (Electron Spin), of γ-Irradiated, Substituted Toluenes (N. K. Bridge), 30
Resonance Absorption (Electron Spin), of the Biradical Molecular Complex, *p*-Phenylenediamine-chloranil (Dr. Y Matsunaga and Prof. C. A. McDowell), 916
Resonance Observations (Electron Paramagnetic), on Irradiated Thiols and Disulphides (T. Henriksen and A. Pihl), 307
Resonance Spectrum (Nuclear Spin), of Isotactic Polystyrene (Dr. R. J. Kern and Dr. J. V. Pustinger), 236
Resources (Natural) : Conservation of (edited by Guy-Harold Smith), second edition, *review* by Prof. L. Dudley Stamp, 345
  The Conservation of (Richard C. Haw), *review* by Prof. L. Dudley Stamp, 345

Resources (Natural), in Scotland : Committee on (Dr. F. N. Woodward), 574
Resources (Nature and Natural), International Union for Conservation of : Bulletin 8, Protection of Nature in the Soviet Republic of Azerbaijan (G Aliev), 580
Respiration Salts and (Prof. H Lundegardh), 70
Respiration of Decapitated Mosquitoes (Rachel Galun), 391
Respiration (Exogenous), in *Nitrobacter* (Prof. W S Silver), 555
Respiration-rate of Cotton Leaves : Effect of Infection by *Xanthomonas malvacearum* (E.F.S.) Dowson on (Dr. H. M. Hassan and K. A. Sabet), 177
Respiratory Function of the Swim-bladder of *Notopterus* (Lacepede), (Padmakar V. Dehadrai), 929
Response of Growing Plants to a Uniform Daily Rotation (R L Jones), 775
Response of Inbred and F_1 Hybrid Mice to Hormone (Dr. C. K Chai), 514
Response (Plant-Growth) Magnetotropism, a New (Prof L. J. Audus), 132
Responses of Central Auditory Neurones . Pitch Discrimination in Orthoptera (Insecta) demonstrated by (Dr. G A. Horridge), 623
Resting Potentials in Isolated Frog Sartorius Fibres at Low External Potassium Concentrations (Dr Roderick P. Kernan), 471
Restriction (Food), and Salt Preference in Rats (Hans Kaunitz, Lester M. Geller, Charles A. Slanetz and Ruth E. Johnson), 350
Restriction (Prolonged Salt), in Hypertension : Adrenocortical Function after (Dr Lewis K. Dahl, Dr. Lawrence Silver, Dr. Robert W. Christie and Dr. Jacques Genest), 110
Retention of Chronically Ingested Radiostrontium : Effectiveness of Dietary Substances in reducing the—Studies with Tannin (Prof. R. H. Wasserman and Dr. C. L. Comar), 629
Retention of Potassium by Human Erythrocyte Ghosts (Dr J. F. Hoffman, Dr. D. C. Tosteson and Dr. R. Whittam), 186
Reticulo-Endothelial System . Minimum Dose of Diethylstilboestrol required to Stimulate the Phagocytic Activity of the (Prof. T. Nicol and C C Ware), 42
Retinal Images Monocular 'Rivalry' between Stabilized and Unstabilized (Dr. D. M. MacKay), 834
Reversal of Genetic Dwarfism in *Tephrosia vogelii* by Gibberellin (James E. Irvine and Rubén H. Freyre), 115
Reversed Phase-Partition Chromatography : Separation of Uranium by (A. G. Hamlin and B. J. Roberts), 527
Reversible Inhibition of Photosynthesis in Synchronized Cultures of Algae (Dr. Constantine Sorokin), 933
Reversible Supercontraction of β-Keratose (Dr F. G. E. Pautard and Dr. P. T. Speakman), 176
Reynolds, Dr. Doris : Awarded the Lyell Medal of the Geological Society of London, 657
Rezanowich, A , and Goring, D A. I. : At the Ninth Canadian High Polymer Forum (The Polyelectrolyte Properties of a Lignin Sulphonate Microgel), 359
Rhesus Monkey : Fine Innervation of the Carotid Body of the (R. P. Gould), 183
Rhenium : Evidence for the Existence of a Potassium Rhenium Hydride and its Bearing on the Nature of the (—1)-Oxidation State of (A. P. Ginsberg, J. M. Miller, J R. Cavanaugh and B. P. Dailey), 528
Rhenium Hydride (Potassium) Evidence for the Existence of a, and its Bearing on the Nature of the (—1)-Oxidation State of Rhenium (A. P. Ginsberg, J. M. Miller, J. R. Cavanaugh and B P. Dailey), 528
Rheology : Studies in, *review* by Dr. G. W. Scott Blair, 878
Rheology of Disperse Systems—Proceedings of a Conference organized by the British Society of Rheology, Swansea, 1957 (edited by C. C. Mill), *review* by Dr G W. Scott Blair, 878
Rheology, American Society of : Transactions of the, Vol. 2 (edited by R. D. Andrews), *review* by Dr. G. W. Scott Blair, 878
Rheology, British Society of : Proceedings of a Conference on the Rheology of Disperse Systems, Swansea, 1957 (edited by C. C. Mill), *review* by Dr. G. W. Scott Blair, 878
Rhizopus sexualis · A Possible Relationship between Nucleic Acid Metabolism and the Initiation of Zygospores of (P. M. Hepden and Dr. B. F. Folkes), 254
Rhizosphere Effect on Soil Algae (W. Hadfield), 179
Rhodesia (Southern) : Prehistory of, *review* by Dr. Revil Mason, 65
Rhodesian Trout Streams : Quantitative Estimations of Populations of the River Crab, *Potamon* (*Potamonautes*) *perlatus* (M. Edw.), in (Peter St. J. Turnbull-Kemp), 481
Rhodotorula rosea Cultures · Effect of Coumarin on the Growth of (J. S. Knypl and J. S. Szopa), 933
Rhondda Valleys : The—a Study in Industrial Development, 1800 to the Present Day (E. D Lewis), *review* by Prof. L. Dudley Stamp, 415
Rhuland, Dr. L. E. α, ε-Diaminopimelic Acid—Its Distribution, Synthesis and Metabolism, 224
Rhythm (A Temperature-dependent Endogenous), in the Rate of Carbon Dioxide Output of *Periplaneta americana* (Dr. M. B Wilkins), 481
Rhythms (Brain), In a Socially Isolated Community : Intelligence, Personality and (A. C. Mundy-Castle and G. K. Nelson), 484
Riboflavin in Sturgeon Skin : Occurrence of (Dr. A. Courts), 463
Ribonucleases in Takadiastase (Kimiko Sato-Asano and Prof. Fujio Egami), 462
Ribonucleic Acid : Significance of, in the Mechanism of Formaldehyde-induced Mutagenesis (Dr. Thomas Alderson), 904
Ribonucleic Acid (Soluble), in Yeast: Preparation and some Properties of a (Eiko Otaka and Syozo Osawa), 921
Ribonucleoproteins : Antibodies in (Dr. M. Feldman, Dr D. Elson and Dr. A. Globerson), 317

Rovira, A. D , and Bowen, G. D · Effect of Micro-organisms on the Development of Roots and Root Hairs of Subterranean Clover (*T. subterraneum*), 260
Rowallan, Rt. Hon. Lord : Elected president for 1960 of the Royal Society of Tasmania, 815
Royal Astronomical Society : Gold Medal awarded to Prof. V. A. Ambartsumian, 144
  Eddington Medal awarded to Dr R. d'Estcourt Atkinson, 144
  Jackson Gwilt Medal and Gift awarded to F. Maine Bateson and A. F. A. Lofley Jones, 144
Royal Botanic Gardens, Kew : Appointment of A. L. Jewell to a newly created post of exhibitions officer, 356
  Appointment of Dr. Keith Jones as a Principal Scientific Officer, to undertake research in cyto-genetics, 734
Royal College of Science and Technology, Glasgow (Department of Mechanical, Civil and Chemical Engineering) · Symposium on Nuclear Reactor Containment Buildings and Pressure Vessels, 660
Royal Geographical Society : Patron's Medal awarded to Prof. Théodore Moned, 735
  Founder's Medal awarded to Phillip G. Law, 735
  Victoria Medals awarded to Dr. Armando Cortesao and Prof. J. A. Steers, 735
  Murchison Grant awarded to Prof. J. Wreford Watson, 735
  Back Grant awarded to A. T. Grove, 735
  Cuthbert Peek Grant awarded to G. F. Reid, 735
  Gill Memorial awarded to Joyce M. Lambert, 735
  Mrs. Patrick Ness Award awarded to R. J. Adie, 735
Royal Institute of Chemistry : Research Diploma for work in Pure and Applied Chemistry, 285
Royal Institute of Chemistry and the Chemical Society : Joint Annual Meetings to be held in Belfast, 286
Royal Institute of Chemistry, and others : Symposium on the Industrial Chemistry of the Lower Olefines, 660
Royal Microscopical Society and the Electron Microscopy Group of the Institute of Physics : Discussion on Co-ordination of Light and Electron Microscopy, 660
Royal Naval Scientific Service : Retirement of J. Buckingham as director of research programmes and planning, 578
  Appointment of Dr. W. E. Pretty as first director of a new Department of Research and Development Services, 578
Royal Scottish Museum : Upjohn Cell Model at the, 13
Royal Society of Edinburgh : Election of new Fellows, 734
Royal Society of London : Appointment of vice-presidents, 74
  Discussion on the Biology of the Southern Cold Temperate Zone, 204
  The Birth of the, *review* by Prof. E. N. da C Andrade, 343
  History of the (Thomas Sprat), edited with Critical Apparatus by Jackson I. Cope and Harold Whitmore Jones), *review* by Prof. E. N. da C. Andrade, 343
  Report of the Committee on Scientific Research in Schools, 659
  Wolfson Research Professorship, 735
  Grant of £2,291 to the Department of Physical and Inorganic Chemistry of the University of Bristol, for the purchase of a high-temperature resistance vacuum furnace, 736
  Tercentenary Celebrations of the (Dr. D. C Martin), 879
Royal Society and Nuffield Foundation : Awards under the Commonwealth Bursaries Scheme, 212
Royal Society of Tasmania · Election of Officers for 1960, 815
Royal Society of Tropical Medicine and Hygiene : Symposium on the Evolution of Arborvirus Diseases, 740
Rubber Industry Display at the Science Museum, London, 432
Ruben, Dr. H. · Appointed senior lecturer in charge of the Department of Statistics, University of Sheffield, 737
Rubidium–Strontium Ages (Potassium–Argon and), of some Granites from Britain and Eire (Prof. J. L. Kulp, Dr. L. E. Long, C. E. Giffin, Dr. A. A. Mills, Dr R. St J. Lambert, Dr. B. J. Giletti and Dr. R. K. Webster), 495
Rucker, Dr. W (Brzeski, Dr. W., and) : Biosynthesis of Chlorophylls *a* and *b* in *Chlorella vulgaris*, 922
Rudimentary Gonad of an Intact Domestic Fowl Experimentally Induced Proliferation of the (Prof. W. Kornfeld), 320
Rudolph, William E. Awarded the David Livingstone Centenary Medal of the American Geographical Society, 12
Rumen Bacteria · Hydrogenation of Chloroplast Lipids by (Dr. D. E. Wright), 546
Rumen Protozoa . Isolation of 2-Aminoethane Phosphonic Acid from (Masaaki Horiguchi and Makoto Kandatsu), *erratum*, 146

Scientists in the United States : Employment of, 890
Scientists and Engineers in American Industry (United States National Science Foundation), 213
Scienze : Discorsi e Dimostrazioni Matematiche intorna a due Nuove (Galileo Galilei), (a cura di Adriano Carugo e Ludovico Geymonat), *review* by L. Roth, 717
Scoring of a 'Steadiness' Test (J. D. Acland), 337
Scotland : Dairy Research in (Dr. C. C. Balch), 147
Scotland, Committee on Natural Resources in (Dr. F. N. Woodward), 574
Scott, Dr. A. : Appointed lecturer in zoology at the Queen's University, Belfast, 14
Scott, Peter, and Boyd, Hugh (edited by) : Tenth Annual Report of the Wildfowl Trust (1957-58), 147
Scott, R. P. W. : Cathode-Ray Presentation of Chromatograms, 312
Scott, Dr. T. E., and Troiano, Dr. A. R. : Interstitials and Fracture of Metals, 372
Scottish Council (Development and Industry) : Committee on Natural Resources in Scotland (Dr. F. N. Woodward), 574
Scottish Field Studies Association : Programme for April-September, 355
Scottish Museum (Royal) : Upjohn Cell Model at the, 13
Scrapie, a Transmissible Hereditary Disease of Sheep (H. B Parry), 441
  Cerebellar and Midbrain Lesions in (Dr. I. Zlotnik), 785
Scrase, Dr. F. J. : Recent Advances in Atmospheric Electricity, *review*, 131
Sea · On the Nature of Production in the (Dr. D. H. Cushing), 218
  Plant–Animal Food Cycles in the (J. H. Steele), 218
  Recognition of Folds and Faults on Rock Surfaces beneath the (A. H. Stride), 837
Sea Fisheries : Forecasting the Annual Yield in (Prof. Per Ottestad), 183
Sea-Level : Momentum Spectrum of Cosmic Rays at (F. Ashton, G. Brooke, M. Gardener, P. J. Hayman, D. G. Jones, S. Kisdnasamy, J. L. Lloyd, F. E. Taylor, R. H. West and A. W. Wolfendale), 364
Sea-Level Fluctuations during the Past Four Thousand Years (J. C. Schofield), 836
Sea Snake, *Enhydrina schistosa* : Isolation of the Neurotoxic Component of the Venom of the (Jocelyn E. Carey and Dr. E. A. Wright), 103
Sea Shells of Tropical West America (Prof A. Myra Keen), *review* by I. C. J. Galbraith, 275
Sea-Water : Variations in the Plasma-Level of Chloride in Hatchery-reared Yearling Atlantic Salmon during Parr–Smolt Transformation and following Transfer into (Prof Arthur H. Houston), 632
  Volatile Organic Matter in Algal Culture Media and (F. A. J. Armstrong and G T. Boalch), 761
Seal, Dr. M. : Graphitization of Diamond, 522
Season : Variation of Upper-Atmosphere Density with Latitude and—Further Evidence from Satellite Orbits (D. G. King-Hele and D. M. C. Walker), 727
Second Explosion Limit of Dried Carbon Monoxide–Oxygen Mixtures (P. G. Dickens, J. E Cove, J. F. Harrold and Dr. J. W. Linnett), 606
Secondary Electron Multiplication (Transmitted) : An Image Intensifier with (W. L. Wilcock, D. L. Emberson and B. Weekley), 370
Secondary Modern Schools : Your (J. Vincent Chapman), *review* by T. H. Hawkins, 719
Secondary Pairing of Bivalents with Genetically Similar Chromosomes (Dr. Ralph Riley), 751
Secretion in the Oviduct of the Amphibia : Hormonal Control of (Patricia D. B. Lodge and Dr. C. L. Smith), 774
Sectioning (Ultra-thin), and Electron Microscopy : Study of Life-cycle of *Schizosaccharomyces octosporum* by means of (S. F. Conti and Prof. H. B. Naylor), 633
Sections (Ultra-Thin), of Mineralized Human Enamel : Preparation of (R. W. Fearnhead), 550
Sector-Scanning Asdic (Electronic), an Improved Fish-Locator and Navigational Instrument (Prof. D. G. Tucker and Dr. V. G. Welsby), 277
Sedimentary Rocks (Ancient) : Presence of Carbohydrates and other Organic Compounds in (J. G. Palacas, F. M. Swain and Prof. F. Smith), 234
Sedimentation of Blood without Anticoagulants (Prof. A. B. Chandler), 697
Sedimentation of Deoxyribonucleic Acid isolated under Low Hydrodynamic Shear (Dr. P. F. Davison), 918
Sedimentation and Effective Viscosity (Dr. D. R. Oliver), 912 ; (Prof. G. J. Kynch), 913

Sediments : Clay Minerals in (Clay Minerals Group of the Mineralogical Society Discussion on), 286
Seed Incompatibility in *Primula* (Prof. D. H. Valentine and Dr. S. R. J. Woodell), 778
Seeded Grapes Effect of Gibberellic Acid on (S. Lavee), 395
Seedlings (Lettuce) : Effect of Gibberellic Acid on Hypocotyl Growth of (Dr. B. Frankland and Prof. P. F. Wareing), 255
Seeds (Lettuce) : Chlorogenic Acid of (Dr Warren L Butler), 856
Seeds (*Vicia faba*) : Damaging Effect of Drying on (Dr W. Klingmuller and Dr. G. R. Lane), 699
Seegal, Beatrice C, and others . Neutralization of Human Serum and Pituitary Thyrotropic Fractions with Antisera to Bovine Pituitary Thyrotropin, 472
Seegers, Dr Walter H., and others : Significance of Thrombin-E in the Prothrombin Activation Sequence, 930
Seepage Moisture : Bedrock Corrosion and Drainage Initiation by, on a Gritstone Escarpment in Derbyshire (B. T. Bunting), 447
Sehon, Prof. A. H. (Goodfriend, Dr. L, and) : Antigenicity of Œstrone–Protein Conjugates, 764
Seismology : Gassiot Research Fellowships in Geomagnetism and (Meteorological Office), 892
Sekla, Prof. B., and Holečková, E Diathelic Immunization of Sheep against a Rat Cancer, 618
Sekuzu, Ichiro, and others Preparation of Crystalline Cytochromes from *Porphyra tenera*, 105
Selachian Neurocrania : Dorsal Fontanelles in (Dr. A R. Hamdy), 939
Select Committee on Estimates : Seventh Report from the (The Youth Employment Service and Youth Service Grants), 874
Selection : Effect of, on the Frequency of Genotypes determining Incompatibility in *Prunus avium* (Watkin Williams and J. S Gale), 944
Selective Biological Membrane Transport of Individual Amino-Acids (Dr. S M. Hardy), 245
Selenium (Urinary), and Dental Caries (P. B. Cadell and F. B. Cousins), 863
Self-Incompatibility System in Two Mexican Species of *Solanum* (Kamla K. Pandey), 483
Self-quenching Geiger Counters containing Mixtures of Permanent Gases (A. J. L. Collinson, I C. Demetsopoullos, J. A Dennis and J. M. Zarzycki), 369
Seligman, Dr. H. : Radioisotopes in Scientific Research, *review*, 415
Sellers, Prof E. S. Resignation as head of the Department of Chemical Engineering, University College of Swansea, 578 ; work of, 578
Semi-Arid Conditions (Arid and) : Water Relationships of Plants in (Unesco Symposium on), 435
Semi-Microchemical Methods : Micro- and (Norwood Technical College, London, Course on), 737
Semi-Skilled Operatives in Manufacturing Industry : Training Unskilled and (W. D. Seymour), 509
Semi-Synthetic Analogues of Pyrrolizidine Alkaloids : Heptatotoxic Activity of (Dr. R. Schoental and Dr. A R. Mattocks), 842
Sen, Dr. Ranjit : Cystine as an Essential Amino-Acid for the Growth of a Strain of *Shigella dysenteriae* I (*Sh. shiga*), 267
Sen Gupta, Dr. J. C. : Elected president for 1960-61 of the International Society of Tropical Ecology, 433
Senate (United States), Committee on Foreign Relations of the : Science and Foreign Policy in the United States, 584
Senez, M., and Daoust, H. : At the Ninth Canadian High Polymer Forum (Heat Parameters for Poly*iso*butylene Solutions), 359
Senft, Dr. Alfred W. (Kanwisher, Dr. John W., and) : Physiological Examination of a Live Whale, 13
Senior, Dr. D. A. : Appointed scientific attaché to the British Embassy in Moscow, 356
Sense : The Sixth (Rosalind Heywood), *review* by Dr. E. J. Dingwall, 646
Sensitivity (Directional) : A Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* in Terms of (Prof. O. Lowenstein and J. Wersäll), *errata*, 76
Sensitivity (Histamine), in Children after *Pertussis* Infection (Dr. R. K. Sanyal), 537
Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* . A Functional Interpretation of the Electron-Microscopic Structure of the, in Terms of Directional Sensitivity (Prof. O. Lowenstein and J. Wersäll), *errata*, 76
Separation of the Hypnotic Potentiating Principles from the Essential Oil of *Acorus calamus* L. of Indian Origin by Liquid–Gas Chromatography (Ross M. Baxter, P. C. Dandiya, S. I Kandel, A. Okany and Prof. G. C Walker), 466
Separation of Uranium by Reversed Phase-Partition Chromatography (A. G. Hamlin and B. J. Roberts), 527
Separation Factors in Gas Chromatography (W. A. Wiseman), 841
Sera (Normal Human) : Inheritance of a New Group-Specific System demonstrated in, by means of an Immuno-Electrophoretic Technique (Dr Jan Hirschfeld, the late Bengt Jonsson and Marianne Rasmuson), 961
Sericultural Commission, International Second International Technical Sericultural Conference, 76
Sericultural Conference : Second International Technical (International Sericultural Commission), 76
Serine . Crystallization of Non-Racemic Mixtures of the Isomers of (Prof. Martin L. Minthorn, jun , and Roger E. Koeppe), 459
L-Serine Phosphate : Crystal Structure of (G. H. McCallum, Prof. J Monteath Robertson and Dr. G. A. Sim), *errata*, 14
Serlupi-Crescenzi, G., and others : Incorporation of α, ω-Dicarboxylic Acids as Side-Chains into the Penicillin Molecule, 97
Sermonti, G, and others : Incorporation of α, ω-Dicarboxylic Acids as Side-Chains into the Penicillin Molecule, 97
Serological Relationships (Chemical and), of certain Bacterial Polysaccharides containing Sialic Acid (Prof. Guy T. Barry, Tien-Hu Tsai and Francis P. Chen), 597
Serotonin : Effect of Cardiac Glycosides and Inorganic Ions on Binding of, by Platelets (Herbert Weissbach, Betty G. Redfield and Elwood Titus), 99
Serotonin : and Norepinephrine in the Brain : Reserpine and the Levels of (H. Sheppard and J. H. Zimmerman), 40
Serotonin and Vasopressin (Reserpine,). Effects of, on the Survival of Cold-Stressed Rats (R Michel Zilberstein), 249
Serum : Induction of a Vascular Permeability Factor by the Interaction of Guinea Pig Tissue Debris with (Dr. P. J. Mill), 246
Serum (*Hevea brasiliensis* Latex) : Co-factors in (A. I. McMullen), 103
Serum (Human), and Pituitary Thyrotropic Fractions : Neutralization of, with Antisera to Bovine Pituitary Thyrotropin (Dr. Sidney C. Werner, Ephraim Otera-Ruiz, Beatrice C. Seegal and Robert W. Bates), 472
Serum Agar Cultures of Bone Marrow Flecks : Effect of Amethopterin and 6-Mercaptopurine on the Pattern of Oxygen Tension Measurements in the Fluid Phase of (Dr. H. J. Woodliff and J. M. G. Davis), 477
Serum Chromatography on Columns connected to a Common Source of Buffer Gradients (A. G. M. Marr and C. M Gilbo), 853
Serum Precipitin to Brain Ganglioside : Demonstration of (Dr. Samuel Bogoch), 392
Serum Proteins (Native) : Cell-Growth of Plant Roots, Inorganic Salts and (Dr. Folke Rønnike), 151
Serum-containing Cell Cultures (Serum-free and) : Multiplication of Vaccinia Virus in (Robert W Pumper, Lawrence J. Alfred and David L. Sackett), 123
Serum-free and Serum-containing Cell Cultures Multiplication of Vaccinia Virus in (Robert W. Pumper, Lawrence J. Alfred and David L. Sackett), 123
Service of Youth : In the, 873
Service (The Youth), in England and Wales (Ministry of Education), 873
Service (Youth Employment), and Youth Service Grants (Seventh Report from the Select Committee on Estimates), 874
Service Grants (Youth) The Youth Employment Service and (Seventh Report from the Select Committee on Estimates), 874
Sessile Barnacle Shells : Interlaminate Figures of (R Read), 778
Settlement of Marine Organisms : Influence of Filming and of Surface Texture on the (Dr. D J. Crisp and J. S. Ryland), 119
Seventeenth Century Chemistry : Robert Boyle and (Dr. Marie Boas), awarded the Pfizer Prize of the History of Science Society, 660
Sex-limited DDT-Resistance in House-Flies (R. W. Kerr), 868
Seymour, W. D. : Training Unskilled and Semi-Skilled Operatives in Manufacturing Industry, 509
Shackleton, Prof. R. M. : Geological Implications of Recent Geophysical Work in the British Isles, 739
Shahak, I (Bergmann, Ernst D, and) : Triethyl α-Fluoroaconitate, 529
Shape of the Precipitate in Immunoelectrophoresis (Dr. Jan Hirschfeld), 164, *erratum*, 507
Shape of Ultra-Violet Inactivation Curves of Transforming Deoxyribonucleic Acid (Claud S. Rupert and Sol H Goodgal), 556
Shape Recognition in the Octopus : The Plexiform Zone and (Dr. J. A. Deutsch), 443
Shape and Size of Deoxyribonucleic Acid : Effect of Ultra-violet Light on the (Dr. P Alexander and Dr H Moroson), 678
Shapiro, Dr. B (Gatt, Dr. S., and) : Metabolism of 1-^{14}C Lignoceric Acid in the Rat, 461
Sharp, B. B. : Cavity Formation in Simple Pipes due to Rupture of the Water Column, 302
Shaw, K. B, and others . Formation of I- and III-Type Porphyrins by the Polymerization of Pyrroles, 607
Shear (Low Hydrodynamic) : Sedimentation of Deoxyribonucleic Acid isolated under (Dr. P. F. Davison), 918
Sheba, Chaim, and others : Erythrocyte Glucose-6-Phosphate Dehydrogenase-deficient Subjects—Enzyme-Level in Saliva, 931
Sheep : Diathelic Immunization of, against a Rat Cancer (Prof. B. Sekla and E. Holečková), 618
  Fall in Haematocrit in, after Treatment with Chlorpromazine and Dihydroergotamine (Dr. A. W. Turner and V. Elizabeth Hodgetts), 43
  A Hepatotoxin causing Liver Damage in Facial Eczema of (Dr. N. A Worker), 909
  Physiological Mechanisms concerned in the Maintenance of Lactation in the Goat and (R. Denamur and J. Martinet), 252
  Scrapie, a Transmissible Hereditary Disease of (H. B Parry), 441
Sheep (Adult) . Formation of New Wool Follicles in the (A. H. Brook, B. F. Short and A. G. Lyne), 51
Sheep (Grazing) : Attrition of Incisors of (C. R. Barnicoat and D. M. Hall), 179
Sheep-Skin : Dermal Surface of (M. Dempsey), 860
Shell Department of Chemical Engineering, Cambridge, 287
Shell International Petroleum Co : Course for Science Teachers, 737
Shells of Living Molluscs : Manganese Deposition on the (Dr. J. A. Allen), 336
Shells (Sea), of Tropical West America (Prof. A. Myra Keen), *review* by I C. J. Galbraith, 275
Shells (Sessile Barnacle) : Interlaminate Figures of (R. Read), 778
Shemyakin, M. M. Planning in Science, 738
Shenman, G. (Korthals, A., and) : The Lungworm *Protostrongylus rufescens* in Australia, 941
Sheppard, H, and Zimmerman, J. H . Reserpine and the Levels of Serotonin and Norepinephrine in the Brain, 40
Sheridan, Dr J, and others : Microwave Spectrum of Fluorine Cyanide, 96
Sherwell, R. J., and others : Gallium Arsenide Tunnel Diodes, 676
Shewan, Dr. J M. Elected a Fellow of the Royal Society of Edinburgh, 734
Shield, J W. (Sadleir, R. M, and) : Delayed Birth in Marsupial Macropods —the Euro, the Tammar and the Marloo, 335
Shigella dysenteriae I (*Sh. shiga*) : Cystine as an Essential Amino-Acid for the Growth of a Strain of (Dr. Ranjit Sen), 267
Shirasaka, M., and Tsuruta, M. : 11α-Hydroxylation of Steroids by *Streptomyces* Species, 845
Shore, Dr. V. C., and others : Structure of Myoglobin—a Three-Dimensional Fourier Synthesis at 2-Å Resolution, 422
Short, B. F., and others : Formation of New Wool Follicles in the Adult Sheep, 51
Shubik, Dr. Martin : Strategy and Market Structure, *review* by Prof. R. G. D. Allen 645
Shugar, Prof. D., and Baranowska, Dr. J. : Aggregation and Staining Behaviour of Ultra-Violet Irradiated Films of Nucleic Acids, 33
Shull, Dr. Kenneth H. : A Microsomal Malic Dehydrogenase, 582
Shuttle-Box Behaviour of Albino Rats during Prolonged Exposure to Moderate-Level Radiation (Dr. John E. Overall, Dr. W. Lynn Brown and Dr. Loren C. Logie), 665

Sialic Acid : Chemical and Serological Relationships of certain Bacterial Polysaccharides containing (Prof. Guy T. Barry, Tien-Hu Tsai and Francis P. Chen), 597
Sialic Acid in Connective Tissues : Presence of (A. A. Castellani, G. Ferri, L. Bolognani and V. Graziano), 37
Side-Chains into the Penicillin Molecule: Incorporation of α,ω-Dicarboxylic Acids as (A. Ballio, Prof. E. B. Chain, F. Dentice de Accadia, Maria Francesca Mastropietro-Cancellieri, G. Morpurgo, G. Serlupi-Crescenzi and G. Sermonti), 97
Sidewall Friction Effect during Soil Consolidation (Dr. Carl B. Crawford), 371
Sidgwick, J. B. : Introducing Astronomy, *review* by B. R. Leaton, 131
Sigma Phase : Variation of Magnetic Moment with Composition in the Iron–Vanadium (Dr. D. Parsons), 839
Signal (Ultra-High-Frequency), Traversing an Auroral Disturbance : Observed Characteristics of an (J. C. James, L. E. Bird, R. P. Ingalls, M. L. Stone, J. W. B. Day, G. E. K. Lockwood and R. I. Presnell), 510
Significance of Adipose Tissue Lipoprotein Lipase (Dr. J. Páv and Dr. J. Wenkeová), 926
Significance of Ribonucleic Acid in the Mechanism of Formaldehyde-induced Mutagenesis (Dr. Thomas Alderson), 904
Significance of Thrombin E in the Prothrombin Activation Sequence (Dr. Walter H. Seegers, Dr. Ricardo H. Landaburu and Dr. J. Frederic Johnson), 930
Significance (Possible), in the Process of Cellular Differentiation : Occurrence of an Organ-Specific Antigen associated with the Microsome Fraction of Plant Cells and its (Dr. S. T. C. Wright), 82
Silcock, B. : Thoughts on Communication, *review*, 130
Silicate Rocks : Dissolution of (R. R. Brooks), 837
Silicon Boride, SiB_4 : A New (Dr. Carl F. Cline and Dr. Donald E. Sands), 456
Silver, Ann : Ataxia in Hens poisoned with Tri*para*ethylphenyl Phosphate, 247
Silver, Dr. Lawrence, and others : Adrenocortical Function after Prolonged Salt Restriction in Hypertension, 110
Silver, Prof. W. S. : Exogenous Respiration in *Nitrobacter*, 555
Silver Jubilee of *Science and Culture* (Indian Science News Association), 354
Silverman, Dr. Paul H., and Patterson, J. E. : Histotrophic (Parasitic) Stages of *Haemonchus contortus*, 54
Sim, Dr. G. A., and others : Crystal Structure of L-Serine Phosphate, *errata*, 14
Similarities and Dissimilarities (Some), in the Structure of the Skin among the Members of the Suborders Odontoceti and Mystacoceti (Cetacea), (Dr. W. Sokolov), 745
Simon of Wythenshawe, Lady : 'Teen-Age' Education in England, 712
Simple Non-gassing Electrodes for Use in Electrophoresis (Rex Neihof and Sigmund Schuldiner), 526

Stones, Dr. P. B. : Evolution of Arborvirus Diseases, 742
Stotzky, G., and others : *In vitro* Culture of *Musa balbisiana* Colla Embryos, 403
Strain of *Shigella dysenteriae* I (*Sh. shiga*) : Cystine as an Essential Amino-Acid for the Growth of a (Dr. Ranjit Sen), 267
Straka, Ronald M , and others : Observations on the Solar Eclipse of October 2, 230
Strandberg, Dr. B. E., and others : Structure of Myoglobin—a Three-Dimensional Fourier Synthesis at 2-Å. Resolution, 422
Strange World of the Moon (V. A Firsoff), *review* by Dr. B. E. J. Pagel, 718
Strategic Studies, Institute for : Tizard Memorial Lecture, Tizard and the Science of War (Prof. P. M. S. Blackett), 647
'Strategies' (Syllabic), in Written Language (Dr. H. B. G. Thomas), 485
Strategy (Market), and Economic Survival, *review* by Prof R. G. D. Allen, 645
Strategy and Market Structure (Dr. Martin Shubik), *review* by Prof. R. G. D. Allen, 645
Stratigraphical Palaeontology . Mid-Tertiary (F. E. Eames, F. T. Banner, W. H. Blow and W. J. Clarke), 447
Stratosphere : Time of Residence of Radioactive Debris in the (J. Ambrosen), 301
Straus, Jr., William L , and others (edited by) : Forerunners of Darwin, 1745-1859, *review* by Sir Gavin de Beer, 2
Streams (Rhodesian Trout) : Quantitative Estimations of Populations of the River Crab, *Potamon* (*Potamonautes*) *perlatus* (M. Edw.), in (Peter St. J. Turnbull-Kemp), 481
Streptomyces Species : 11α-Hydroxylation of Steroids by (M. Shirasaka and M Tsuruta), 845
Streptomycin : Damage by, to the Cell Membrane of *Escherichia coli* (Effect of Streptomycin on *Escherichia coli*), (Nitya Anand and Dr. Bernard D. Davis), 22
    Effect of, on *Escherichia coli*—Damage by Streptomycin to the Cell Membrane of *Escherichia coli* (Nitya Anand and Dr Bernard D Davis), 22 ; Uptake of Streptomycin by *Escherichia coli* (Nitya Anand, Dr. Bernard D. Davis and Alan K Armitage), 23
    Effect of, on the Incorporation of Tyrosine labelled with Carbon-14 into Protein of *Mycobacterium* Cell Fractions *in vivo* (Dr. T. Erdös and Dr. Agnes Ullmann), 100
    Uptake of, by *Escherichia coli* (Effect of Streptomycin on *Escherichia coli*), (Nitya Anand, Dr. Bernard D Davis and Alan K. Armitage), 23
Stress-Corrosion Crack · Flow of Electrolyte within a Propagating (J. M. West), 92
Stride, A. H. · Geological Implications of Recent Geophysical Work in the British Isles, 740
    Recognition of Folds and Faults on Rock Surfaces beneath the Sea, 837
Stringer, J., and others · Oxidation of Titanium–Iron Alloys, 304
Stromal Material in Haemolysates : Red Cell Agglutination by (S. B de C Baker), 547
Strong Acids and Water Ionic Hydration in Mixtures of (Erik Högfeldt), 760
Strontium-90 Ear Tumours in Rabbits receiving (Dr. H A. Sissons and Dr Janet Vaughan), 399
Strontium-90 in Human Diet in the United Kingdom : Relationship between the Rate of Fall-out and the Concentration of (Dr. J D. Burton, G. M. Milbourn and Dr R. Scott Russell), 498
Strontium-90 Distribution in Human Bone Determination of (R Bjornerstedt and S. Haggroth), 366
Stroujal, Prof H. · Introductory Address to the meeting of the Flora Europaea Organization in Vienna, 15
Stroup, Marjory, and others : Haemolytic Disease of the Newborn probably due to Anti-f, 188
Structural Engineering · Research Scholarship in the Use of Light Alloys in (Institution of Structural Engineers and the Aluminium Development Association), 356
Structural Engineers, Institution of : Grant of £2,000 per annum for seven years to the University of Southampton, to provide for the establishment of a readership in structural engineering in the Department of Civil Engineering, 215
Structural Engineers, Institution of, and the Aluminium Development Association · Research Scholarship in the Use of Light Alloys in Structural Engineering, 356
Structure of Electrolytic Solutions (edited by Walter J. Hamer), *review* by Dr J. N. Agar, 274
Structure of Graphite and the Kinetics of its Reactions (Société de Chimie Physique Conference on), 582
Structure of Haemoglobin—a Three-Dimensional Fourier Synthesis at 5 5-Å. Resolution, obtained by X-Ray Analysis (Dr. M F Perutz, Dr. M. G Rossmann, Ann F Cullis, Hilary Muirhead, Dr Georg Will and Dr. A C T. North), 416
Structure of Languages : Basic Questions in the (American Mathematical Society and the Association for Symbolic Logic Symposium on), 215
Structure of Lithium Methoxide (P J Wheatley), 681
Structure of Monatomic Liquids : Geometry of the (Prof. J D Bernal), 68
Structure of Myoglobin—a Three-Dimensional Fourier Synthesis at 2-Å. Resolution (Dr. J. C Kendrew, Dr R. E. Dickerson, Dr. B. E Strandberg, Dr. R. G Hart, Dr. D R Davies, Dr D. C. Phillips and Dr V. C Shore), 422
Structure of Non-volatile Organic Substances Identification of the, by Gas Chromatography of Pyrolytic Products (Dr. Jaroslav Janák), 684
Structure of the Skin among the Members of the Suborders Odontoceti and Mystacoceti (Cetacea) : Some Similarities and Dissimilarities in the (Dr W Sokolov), 745
Structure (Crystal), of Mellitic Acid (Dr. A. Bezjak and Prof D Grdenić), 756
Structure (Crystal), of L-Serine Phosphate (G H McCallum, Prof. J. Monteath Robertson and Dr. S. A. Sim), *errata*, 14
Structure (Diamond) · Alleged Formation of an Intermediate, on Heating Diamond (Dr. F. A Raal), 523
Structure (Electron-Microscopic), of the Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* in Terms of Directional Sensitivity A Functional Interpretation of the (Prof O Lowenstein and J. Wersall), *errata*, 76
Structure (A Highly Organized), within a Neurosecretory Vesicle (Sir Francis Knowles), 709
Structure (Market) · Strategy and (Dr Martin Shubik), *review* by Prof. R. G D Allen, 645

Structure (Molecular), of Neopentane (Prof R L. Livingston, C. Lurie and Dr. C. N. R. Rao), 458
Structure (Molecular), and Spectroscopy (Ohio State University Symposium on), 582
Structure and Function, including Motility, of Cytoplasmic Membranes : Ionic Exchange and the (Dr. W E. Hutton), 439
Structures (Metallic) : Distortions in (Dr J. Graham), 29
Structures (Non-Metallic Layer) : Observation of Dislocations in (S. Amelinckz and P. Delavignette), 603
Struve, Prof. Otto, and others Elementary Astronomy, *review* by Dr. R. H. Garstang, 130
Stubblefield, Dr. Cyril J. : Appointed director of the Geological Survey of Great Britain and the Museum of Practical Geology, 284 ; work of, 284
Students for Technical Experience, International Association for the Exchange of : Students exchanged during the Summer Vacation of 1959, 355
Students (Day-release), in Technical Education, 737
Students (University), and their Academic Origins (R. K. Kelsall), 218
Studentships and Fellowships (Department of Scientific and Industrial Research), 892
Studies in Rheology, *review* by Dr. G. W. Scott Blair, 878
Studies with Tannin : Effectiveness of Dietary Substances in reducing the Retention of Chronically Ingested Radiostrontium— (Prof. R. H. Wasserman and Dr. C. L Comar), 629
Studies (Flow), with Porous Models Optical Scanning of Liquid Concentration in (Dr. E. R Deutsch), 675
Studies (Fluorescence), of Chloroplast Development in *Euglena* (Dr. H. T. Epstein, E. Boy de la Tour and Dr. Jerome A. Schiff), 825
Studies (High Specific Activity Tracer) : A Pitfall in (Dr. E. Hell, Dr. R. J. Berry and Dr. L G. Lajtha), 47
Studies (Interferometric), on Synthetic Diamonds (Prof. S. Tolansky and Dr. I. Sunagawa), 203
Studies (Optical Rotatory Dispersion), on Partially Methylated Cellulose (W. Brock Neely), 159
Studies (Radiosensitivity), *in vivo* : Estimation of the Cellular Lethal Dose and the Critical Cell Number for the *C3H* Mouse Mammary Carcinoma, from (A Cohen and L. Cohen), 262
Studies (River), in Nigeria, *review* by Prof. W. G V Balchin, 274
Studies (River), and Recommendations on Improvement of Niger and Benue (Nedeco, Netherlands Engineering Consultants), *review* by Prof. W G. V Blachin, 274
Study in High Molecular Weight Carbohydrates : Physical, Chemical and Biological Methods of (Chemical Society Symposium on), 507
Study in Industrial Development, 1800 to the Present Day : The Rhondda Valleys—a (E D. Lewis), *review* by Prof L Dudley Stamp, 415
Study of Life-cycle of *Schizosaccharomyces octosporus* by means of Ultra-thin Sectioning and Electron Microscopy (S. F. Conti and Prof. H. B. Naylor), 633
Study of the Prediction of Academic Success in the Queen's University of Belfast . An Audit of Academic Performance—a (Michael Forster), 218
Study of the Soil in the Field (G. R. Clarke), fourth edition, *review* by Dr. R M S Perrin, 2
Study (An Autoradiographic), of the Distribution in Mice of Œstrogens labelled with Carbon-14 and Tritium (Dr J C. De Paepe), 264
Study (Neutron Diffraction), of Antiferromagnetic Spin Waves in α-Ferric Oxide (J. A Goedkoop and T Riste), 450
Studying Immunological Reactions : Antigen–Antibody in Liquid Two-Phase Systems—a Method for (Per-Åke Albertsson and Lennart Philipson), 38
Sturgeon Skin · Occurrence of Riboflavin in (Dr. A. Courts), 463
Sturkie, Prof P. D. : Elected a Fellow of the Royal Society of Edinburgh, 734
Styela mammiculata Carlisle (Ascidian) : Spread of the (D. R. Houghton and H. R. Millar), 862
Sub-Units in Southern Bean Mosaic Virus (Dr Beatrice S Magdoff), 673
Subbota, M I, and others · Geochemical Methods of Prospecting and Exploration for Petroleum and Natural Gas (English translation edited by Paul A. Witherspoon and William D. Romey), *review* by Dr. John S Tooms, 876
Subrahmanyam, S V. : Ultrasonic Velocities in Aqueous Solutions of Cadmium Iodide and Mercuric Chloride, 371
Subrahmanyam, S. V. (Reddy, P. Jayarama, and) : Dependence on Temperature of Elastic Moduli of Tin, 29
Subrahmanyan, R · Algology (Marine Phytoplankton of the West Coast of India in special relation to Fisheries), 821
Substance extracted from the Fermentation Products of *Acetobacter aceti* on Ehrlich's Ascites Tumour Cells : Activity of a (G. A. Lanzani and A. Pecile), 175
Substance in Lingcod Liver Oil which prevents Hypercholesterolaemia in Cholesterol-fed Chickens (J. D. Wood and Jacob Biely), 473
Substances (Cementing), in Metastasizing and Non-Metastasizing Transplantable Tumours in Mice (G Gasić, F. Loebel and O. Badinez), 864
Substances (Non-volatile Organic) · Identification of the Structure of, by Gas Chromatography of Pyrolytic Products (Dr Jaroslav Janák), 684
1-Substituted Pyrazole-4-Carboxylic Acids : A New Route to (Dr. D. G. O'Donovan, A P. Carroll and Prof J. Reilly), 460
Substituted Toluenes (γ-Irradiated,) : Electron Spin Resonance of (N. K. Bridge), 30
Substitution Reactions of Cobaltic Complexes catalysed by Adsorption (A A Vlček and J. Kuta), 95
Substitution Reactions (Mild) : Inactivation of Erythropoietin by Neuraminidase and by (Dr. Peter H. Lowy, Dr. Geoffrey Keighley and Dr. Henry Borsook), 102
Substrate for the Measurement of Trypsin and Chymotrypsin : Casein labelled with Iodine-131 as a (Dr. Bernard J. Katchman, Dr Robert E. Zipf and Dr. George M. Homer), 238
Subterranean Clover (*T. subterraneum*) : Effect of Micro-organisms on the Development of Roots and Root Hairs of (A. D. Rovira and G. D. Bowen), 260
Success (Academic), in the Queen's University of Belfast : An Audit of Academic Performance—a Study of the Prediction of (Michael Forster), 218
Successful Hybrid (First), between the Two Jute-yielding Species, *Corchorus olitorius* L. (Tossa) x *C. capsularis* L. (White), (Ahmad Shamsul Islam and A. Rashid), 258
Successive Copulations : Fertilization of Eggs of the Desert Locust by Spermatozoa from (Philip Hunter-Jones), 336
Succinic Dehydrogenase Activity in Osteoclasts : Histochemical Demonstration of (Dr. M. S. Burstone), 866
Sugar Content : Relation of, to Frost-Hardiness in Plants (Dr. Akira Sakai), 698
Sugar/Protein Mixtures : Survival of Bacteria on Drying in (B. R. Record and R. Taylor), 944
Sugden, Dr. T. M., and others : Some Atomic Reactions by Absorption Spectroscopy, 759
Sugimura, Yasutomo, and others . Preparation of Crystalline Cytochromes from *Porphyra tenera*, 105
Suito, Prof. E., and Uyeda, N : Spiral Growth of Colloidal Gold and Moiré Fringe, 453
Sulphate (Calcium) Hemihydrate : The α- and β-Forms of (D. A. Powell), 375
Sulphate (Copper) Monohydrate : Recrystallization of Amorphous (G. A. Specken and Prof. K. J. McCallum), 758
Sulphate (Inorganic) : Effect of, on Molybdenum Excretion by a Marsupial (Shelley Barker), 41
Sulphate (Triglycine) : Thermal Expansion of (S. Ganesan), 757
Sulphate and Molybdate : Demyelination in Lambs born of Ewes maintained on High Intakes of (C. F. Mills and B. F. Fell), 20
Sulphides : Molybdenum and Niobium (Dr. F. Jellinek, Dr. G Brauer and Dr. H. Muller), 376
Sulphydryl Group Reagents : Effect of, on Tryptophanase Activity (J. M. Turner and Prof. Frank C. Happold), 763
Sultana Canes : Effect of Direction of Growth on (P. May), 394
Summer School of Health Physics (Radiation Protection) at the Imperial College of Science and Technology, London, 815
Summer School in Theoretical Chemistry (University of Oxford), 582
Summers, Roger · Inyanga—Prehistoric Settlements in Southern Rhodesia, *review* by Dr. Revil Mason, 65
Sunagawa, Dr. I (Tolansky, Prof. S, and) . Interferometric Studies on Synthetic Diamonds, 203
Sundaralingam, V. S. : Algology (Comparative Morphology of the Charophytes), 820
Supercontraction (Reversible), of β-Keratose (Dr. F. G. E. Pautard and Dr. P. T Speakman), 176
Superfluid Flow : Mechanism of (Dr. C. G. Kuper) 832
Supposed Giant Deciduous Hominid Tooth from Olduvai : An Alternative Interpretation of the (Dr. J. T. Robinson), 407 , (Dr. L. S. B Leakey), 408
Surface : The Lunar, *review* by Dr. B. E. J. Pagel, 718
Surface of Sodium Chloride Crystals : Evaporation Figures on the (Gy. Turchányi and T. Horváth), 601
Surface (Dermal), of Sheep-Skin (M. Dempsey), 860
Surface Characteristics of Fractured Poly (methyl methacrylate), (Dr. James P. Berry), 91
Surface Texture · Influence of Filming and of, on the Settlement of Marine Organisms (Dr. D J Crisp and J S. Ryland), 119
Surface-controlled Bulk Conductivity in Organic Crystals (Dr. H. Kallmann and Dr. M. Pope), 753
Surfaces (Oxide-coated Metal) : Exo-electron Emission and the Optical Properties of (J. A. Ramsey), 602
Surfaces (Rock), beneath the Sea : Recognition of Folds and Faults on (A. H. Stride), 837
Survey of Abnormal Haemoglobins in Portuguese Guinea (Prof. Carlos Trincao, L. T. de Almeida Franco and Alfredo R. Nogueira), 326
Surveys (Geophysical), in Mining, Hydrological and Engineering Projects, 1958, *review* by Dr. T F. Gaskell, 200
Survival of Bacteria on Drying in Sugar/Protein Mixtures (B. R. Record and R. Taylor), 944
Survival of Cold-Stressed Rats : Effects of Reserpine, Serotonin and Vasopressin on the (R Michel Zilberstein), 249
Survival of the Twig of Woody Plants at –196°C. (Dr Akira Sakai), 393
Survival (Economic) · Market Strategy and, *review* by Prof. R. G. D. Allen, 645
Susceptibility (Magnetic), of some Transition Elements · Variation with Temperature of the (Dr. H. Kojima, Dr R. S. Tebble and D. E. G. Williams), 90
Suspensions (Dispersed Cell), from Normal and Malignant Tissues : Anaerobic Glycolysis of (Dr. M. Zimmerman, T. M. Devlin and M. P. Pruss), 315
Sutton, Dr. D. A. : British Gelatine and Glue Research Association, 587
Swain, A, and Caradine, P. E : An International Tagging Test with Salmon (*Salmo salar* L.) Smolts, 206
Swain, F. M., and others : Presence of Carbohydrates and other Organic Compounds in Ancient Sedimentary Rocks, 234
Swainson, E (Cook, Dr. Maurice, and) : Awarded jointly the W. H. A Robertson Medal and Premium for 1959 of the Institute of Metals, 735
Sweet, Prof. P. A. : Elected a Fellow of the Royal Society of Edinburgh, 734
Swelling (Mitochondrial), and Liver Injury : Effect of Antihistamines on (Dr. J. D. Judah), 390
Swift, Dr. D. R. : Cyclical Activity in Endocrine Systems (Cyclical Activity of the Fish Thyroid), 663
Swim-bladder of *Notopterus* (Lacepede) : Respiratory Function of the (Padmakar V. Dehadrai), 929
Swimming in Spider Crabs of the Genus *Macropodia* (R. G. Hartnoll) 181
Sybilska, D. (Kemula, Prof. W., and) : Clathrate Compounds in Chromatography, 237
Sykes, Dr. P. H. : Generation of Temperatures below 1°K , 349
Syllabic 'Strategies' in Written Language (Dr H B G Thomas), 485
Symbiotic Nitrogen Fixation in a Grazed Tropical Grass–Legume Pasture (Dr. A. W. Moore), 638
Symbolic Logic, Association for (American Mathematical Society and the) : Symposium on Basic Questions in the Structure of Languages, 215
'Synaptic Vesicles' in the Neurohypophysis (Dr. R. L. Holmes and Sir Francis Knowles), 710
Synchronized Cultures of Algae : A Reversible Inhibition of Photosynthesis in (Dr. Constantine Sorokin), 933
Synchrotron : The CERN Proton (J. B. Adams), 568
Synchytrium endobioticum (Schilb.) Perc. : Potato Wart Disease (Vit Bojnansky), 367

Synergic Method of Carrying out Continuous Electrochromatography (Dr. S. R. Caplan), 378

Synthesis of Deoxyribonucleic Acid and Multiplication of T_2 Phage : Effect of Nitroacridine 3663 on (Dr. G. Dénes and Dr. L. Polgár), 386

Synthesis of Nucleic Acids and Proteins in Denervated Muscle : Lack of Correlation between (R. Zák and Dr. R. Gutmann), 766

Synthesis of O-Phosphoserine and related Peptides : New Approach to the (Dr. D. Theodoropoulos, Prof. J. Gazopoulos and I Souchleris), 606

Synthesis of Phthaloyl Amino-Acids under Mild Conditions (G. H. L. Nefkens), 309

Synthesis of Tritium-labelled Tyrosine, 3:5-Diiodotyrosine and Thyroxine (Dr. J. R. Tata and A. D. Brownstone), 34

Synthesis (Deoxyribonucleic Acid) Correlation of Loss of Photoreversibility of Ultra-violet-induced Mutations with (Dr. F. L. Haas and Dr C. O Doudney), 637

Synthesis (Enzymic), of L-Aspartate-4-^{14}C (G. G. Dearing and Dr D. A. Walker), 690

Synthesis (*In vitro*), of Foetal and Adult Haemoglobin by Foetal Haematopoietic Tissues (Dr. E. Donnall Thomas, Harry L. Lochte, jun., William B. Greenough, III , and Marion Wales), 396

Synthesis (Induced), of β-Galactosidase in *Escherichia coli* : Role of the Inducer in the (Prof. H. V. Rickenberg), 240

Synthesis (Microbial), of Cysteine · Cysteine-S-sulphonate as an Intermediate in (Dr. Taro Nakamura and Dr Ryo Sato), 163

Synthesis (Protein) Cytoplasmic Particles and their Role in (Colloid and Biophysics Committee of the Faraday Society Discussion on), 815

Synthesis (Protein), in Cell-free Extracts of *Neurospora crassa* : Mediation of the Genetic Control of (S. D. Wainwright), 314

Synthesis and Metabolism : α,ε-Diaminopimelic Acid—its Distribution, (Dr. L. E. Rhuland), 224

Synthetic Chemical · Reduction of Intestinal Absorption by a (Dr. J. A. Nissim), 222

Synthetic Diamonds . Interferometric Studies on (Prof S. Tolansky and Dr. I. Sunagawa), 203

Synthetic Polypeptide Derivatives with Anti-Bacterial Activities (Dr. K. Kovács, Dr. A. Kótai and Dr I Szabó), 266

Synthetic (Semi-) Analogues of Pyrrolizidine Alkaloids : Hepatotoxic Activity of (Dr. R. Schoental and Dr. A. R. Mattocks), 842

Syski, R. : Mathematical Methods of Operations Research (Thomas L. Saaty), *review* by Prof. L. S. Goddard, *erratum*, 433

System (An Anthocyanin-decolorizing), in Sour Cherries (Prof J. P. Van Buren, D. M. Scheiner and Prof. A. C. Wagenknecht), 165

System (Carbon Tetrachloride–Water–Dissolved Helium) : Effect of Ultrasonic Insonation on the (Martin R Levy), 159

System (Embryonic) : Evidence for Protein Turnover in an (Dr. Harry R. Walter and Prof. H. R. Mahler), 398

System (A Mating-type), in an Acellular Slime-mould (Jennifer Dee), 780

System (New Group-Specific) : Inheritance of a, demonstrated in Normal Human Sera by means of an Immuno-Electrophoretic Technique (Dr. Jan Hirschfeld, the late Bengt Jonsson and Marianne Rasmuson), 931

System (Phenoloxidase) from *Periplaneta americana* (L.) : Specificity *in vitro* of a (D. L. Whitehead, P. C. J Brunet and P. W. Kent), 610

System (Reticulo-Endothelial) : Minimum Dose of Diethylstilboestrol required to Stimulate the Phagocytic Activity of the (Prof T. Nicol and C. C. Ware), 42

System (Self-Incompatibility), in Two Mexican Species of *Solanum* (Kamla K. Pandey), 483

System (Thiol Exchange), with Thiolbenzoic Acid (I A. M. Ford and S. A. M. Thompson), 96

System (Urinogenital), of the Common Dogfish : Abnormalities in the (Dr. A. S. Fuller and J. M. Zacharov), 50

Systemic Leukaemia (*L*1210) : Immunity of Mice surviving, to Antifolic Resistant Variants of the Disease (Dr Abraham Goldin, Stewart R. Humphreys, Gerald O. Chapman, Dr. Michael A. Chirigos and John M. Venditti), 219

Systems (Disperse) : Rheology of—Proceedings of a Conference organized by the British Society of Rheology, Swansea, 1957 (edited by C. C. Mill), *review* by Dr. G. W. Scott Blair, 878

Systems (Endocrine) : Cyclical Activity in (Zoological Society of London Symposium on), 663

Systems (Liquid Two-Phase) : Antigen–Antibody in—a Method for Studying Immunological Reactions (Per-Åke Albertsson and Lennart Philipson), 38

Systems (Mixed Solvent) : Chain Transfer in (Uma Shankar Nandi and Santi R. Palit), 235

Szabó, Dr. I., and others : Synthetic Polypeptide Derivatives with Anti-Bacterial Activities, 266

Szilard, Prof. Leo Awarded the Albert Einstein Gold Medal and Award for 1960, 893

Szopa, J. S (Knypl, J. S., and) : Effect of Coumarin on the Growth of *Rhodotorula rosea* Cultures, 933

t : Standardized (John B. de V. Weir), 558

Tabasaranskii, Z. A., and others Geochemical Methods of Prospecting and Exploration for Petroleum and Natural Gas (English translation edited by Paul A. Witherspoon and William D. Romey), *review* by Dr John S. Tooms, 876

Tables : Mathematical (International Tables for X-Ray Crystallography, edited by John S. Kasper and Dame Kathleen Lonsdale, Vol. 2), *review* by Dr. A. R Stokes, 129

Tables (International), for X-Ray Crystallography (edited by John S. Kasper and Dame Kathleen Lonsdale), Vol. 2, Mathematical Tables, *review* by Dr A R Stokes, 129

Tagging Test with Salmon (*Salmo salar* L.) Smolts : An International (A. Swain and P E Caradine), 206

Tagnon, Prof H. J , and Steens-Lievens, A. : Inactivation of Acid Phosphatase in Human Prostatic Homogenates *in vitro*—Role of Calcium, 48

Takadiastase: Ribonucleases in (Kimiko Sato-Asano and Prof. Fujio Egami), 462

Takamiya, Dr Kazuhiko . Anti-Tumour Activities of Copper Chelates, 190

Talwar, S P., and others : Thermo-magnetic Effects in Liquids, 158

Tamiya, H. . Algology (Synchronous Culture as a means of Studying the Metabolic Changes occurring during the Life-cycle), 820 ; (Mass Culture of Microscopic Algae such as *Chlorella* for use as Animal or Human Food), 821 ; (Use of Algae as Food), 821

Tamm, Prof. C. O., and Ostlund, H. G. : Radiocarbon Dating of Soil Humus, 706

Tammar and the Marloo : Delayed Birth in Marsupial Macropods—the Euro, the (R. M Sadleir and J. W. Shield), 335

Tandon, J. N., and others : Thermo-magnetic Effects in Liquids, 158

Tannin : Effectiveness of Dietary Substances in reducing the Retention of Chronically Ingested Radiostrontium—Studies with (Prof. R. H. Wasserman and Dr. C. L. Comar), 629

Tapley, Dr. D. F. (Dunne, Dr. P. B., and) : Oxygen Consumption by Tissues from Rats injected with L- or D-Thyroxine, 622

Tappel, Dr. A. L., and Zalkin, Dr. H. : Inhibition of Lipid Peroxidation in Microsomes by Vitamin E, 35

Tapti Valley, Khandesh, India : A New Palaeolithic Find in (Prof. C. R. Karnik), 711

Tar (Crude) : Growth of Iron Bacteria in (P H. Garnett), 942

Tarjan, Dr. Armen C. : Induction of Traps of Nematophagous Fungi using *Panagrellus redivivus*, 779

Tata, Dr. J. R. (Pitt-Rivers, Dr. Rosalind, and) : The Thyroid Hormones, *review* by Prof. F. G. Young, 721

Tata, Dr. J. R., and Brownstone, A. D : Synthesis of Tritium-labelled Tyrosine, 3:5-Diiodotyrosine and Thyroxine, 34

Tata Grants, Scholarships and Fellowships for Research on Diseases of the Blood, 433

Tavener-Smith, R. : Appointed lecturer in geology at the Queen's University, Belfast, 14

Taxation Problems : Industrial Research Associations—Some, 63

Taxonomy of Yeasts (Dr. Juan Santa María), 781

Taylor, B. G., and others . Glucose-6-Phosphate Dehydrogenase Deficiency Trait in Nigeria, 257

Taylor, B. T. (Bishop, K. F , and) : Growth of the Tritium Content of Atmospheric Molecular Hydrogen, 26

Taylor, Dr E. L. : Ecology of Parasites (Adaptations of a Parasite), 290

Taylor, E. Openshaw : Nuclear Power Plant, *review* by Prof. W. Murgatroyd, 4

Taylor, S. A. : Water Relationships of Plants in Arid and Semi-Arid Conditions (Response of Plants to Water Supply), 435

Teacher : Becoming a (Ministry of Education), revised edition, 432

Teachers : Commonwealth Assistance in Training, 812

Teachers (Mathematics and Science), in Great Britain, 812

Teachers (Science) : Course for (Shell International Petroleum Co.), 737

Teaching Training in Britain, 432

Teale, F W J . Energy-trapping Centres in Photosynthesis, 775

Tebble, Dr. R. S., and others : Variation with Temperature of the Magnetic Susceptibility of some Transition Elements, 90

Technical Books · Recent Scientific and, Supp. vi, January 30 ; Supp. vi, February 27 ; Supp vi, March 26

Technical College : The Computing Laboratory in the (Hatfield Technical College Conference on), 507

Technical Education : Day-release Students in, 737

Technical Exhibition : Twelfth (Association of Oil and Colour Chemists), 286

Technical Industrialists · Nuclear Energy for Engineers and (European Nuclear Energy Agency of the Organization for European Economic Co-operation Courses on), 506

Technical Research (Scientific and), in France : Direction of, 896

Technique : Humane Experimental (Universities Federation for Animal Welfare Symposium on), 893

Technique for Capturing Birds and Mammals (Ronald F. Labisky), 659

Technique (Immuno-Electrophoretic) · Inheritance of a New Group-Specific System demonstrated in Normal Human Sera by means of an (Dr. Jan Hirschfeld, the late Bengt Jonsson and Marianne Rasmuson), 931

Technological Awards, National Council for : Appointment of Sir Harold Roxbee Cox as chairman, 286

Technological Education, London and Home Counties Regional Advisory Council for · Bulletin on Courses in Advanced Technology, 506

Technological Education and the Nuffield Foundation, 658

Technology : Nuclear Power, *review* by Prof. W. Murgatroyd, 4

  Reactor Fuel Element (Imperial College of Science and Technology, London, Course of Lectures on), 215

Technology (Advanced) : Courses in (London and Home Counties Regional Advisory Council for Technological Education Bulletin on), 506

Technology (Heat), of Reactors : Physics and (translated from the Russian), Supplement No. 1 of the Soviet Journal of Atomic Energy, *Atomnaia Energiia*, *review* by Prof. W. Murgatroyd, 4

Technology (Instrument), Society of : Conference on the Value of Instruments and Automatic Control to the Smaller Firm, 737

Tedesca (Principessa) : Lettere a una (Leonhard Euler), (a cura di Gianfranco Cantelli), *review* by L. Roth, 717

'Teen-Age' Education in England, 341 ; (Lady Simon of Wythenshawe), 712

Tektites : Origin of (Dr. George Baker), 291

Tektites and the Earth (Dr. Gerald S Hawkins), 300

Telephone Cable : Trans-Pacific, 431

Television Engineers, Society of Motion Picture and : International Congress on High-Speed Photography, 14

Television and Politics (Edward R. Murrow), (British Association Granada Lectures on Communication in the Modern World), *review* by B. Silcock, 130

Temkin, Oswei, and others (edited by) : Forerunners of Darwin, 1745-1859, *review* by Sir Gavin de Beer, 2

Temperate Zone (Southern Cold) The Biology of the (Royal Society Discussion on), 204

Temperature : Dependence on, of Elastic Moduli of Tin (P. Jayarama Reddy and S. V. Subrahmanyam), 29
  Scales of, in the Meteorological Office, 736
  Variation with, of the Magnetic Susceptibility of some Transition Elements (Dr. H. Kojima, Dr. R. S. Tebble and D. E. G. Williams), 90
Temperature of Insect Neurosecretory Cells *in situ* : A Method of Controlling the (R H. J. Brown and Janet E. Harker), 392
Temperature Coefficient (Negative) : Zone of, in Hydrocarbon Oxidation (K. C Salooja), 32
Temperature-dependent Endogenous Rhythm in the Rate of Carbon Dioxide Output of *Periplaneta americana* (Dr. M. B. Wilkins), 481
Temperatures below 1°K. : Generation of (Low-Temperature Group of the Physical Society Symposium on), 349
Temperatures within the Earth's Core (Prof J. A. Jacobs), 521
Temperatures (Low), of the Environment : Reaction of Hibernators to various (Dr. Zdenek Bartoš), 251
Temporarily Fasted Mice : Use of Chorionic Gonadotropin to prevent Early Embryonic Mortality in (T J McClure), 622
Tencer, R. (Bieliavsky, N , and) : Incorporation of Tritiated Uridine into Amphibian Eggs, 401
Tension (Muscle) Effect of Potassium on, especially on that of Vascular Muscle (Prof L Laszt), 696
Tension Measurements (Oxygen), in the Fluid Phase of Serum Agar Cultures of Bone Marrow Flecks . Effect of Amethopterin and 6-Mercaptopurine on the Pattern of (Dr. H. J. Woodliff and J M G. Davis), 477
Tephrosia vogelii : Reversal of Genetic Dwarfism in, by Gibberellin (James E. Irvine and Rubén H. Freyre), 115
Tercentenary Celebrations of the Royal Society (Dr. D. C. Martin), 879
Terrestrial Ostracods of New Zealand (Ann Chapman), 121
Tertiary Crustal Distortion in Mid-Argyll : Evidence for (Dr. J. L Knill), 234
Tertiary (Mid-) Stratigraphical Palaeontology (F. E Eames, F. T. Banner, W. H. Blow and W. J. Clarke), 447
Test (Experimental), of Verwey and Overbeek's Theory (B. K. Choudhury), 308
Test (An International Tagging), with Salmon (*Salmo salar* L.) Smolts (A. Swain and P E. Caradine), 206
Test (A Simple), for the Presence of Metals in Biological Materials (Dr. C. Milstein), 386
Test ('Steadiness') : Scoring of a (J D. Acland), 337
Testicle (Human) : Relation of Leydig Cells in the, to the Tubules and Testicular Function (J. B W. Halley), 865
Testicular Function : Relation of Leydig Cells in the Human Testicle to the Tubules and (J. B W. Halley), 865
Testosterone Propionate and Insulin : Effect of, on Muscle Cholinesterase Activity (A N. Granitsas, N. Dede and Dr. A. J. Philippu), 320
Tetrahedral Aluminium in Mica : Determination of, by Infra-Red Absorption Analysis (Dr. R. L. P. Lyon and Dr. W. M. Tuddenham), 374
Textile Institute : Election of Dr. A. R. Urquhart as chairman of the Council, 14
  Election of J. C. H. Hurd as honorary secretary, 14
Texture (Surface) : Influence of Filming and of, on the Settlement of Marine Organisms (Dr. D J Crisp and J. S. Ryland), 119
Thackeray, A. D., and others (edited by) · Second Conference on Co-ordination of Galactic Research (International Astronomical Union, Symposium No. 7, Stockholm 1957), *review*, 801
Theodoropoulos, Dr. D., and others : New Approach to the Synthesis of O-Phosphoserine and related Peptides, 606
Theoretical Chemistry : Summer School in (University of Oxford), 582
Theoretical Physics at St. Andrews, 430
Theory of Ball Lightning Formation (Prof. W K R. Watson), 449
Theory of Elementary Particles (Dr. J. Hamilton), *review* by Prof. D. H. Wilkinson, 200
Theory (A Convective-Turbulence), of Thunderstorms (Dr. N. Ramalingam), 900
Theory (Verwey and Overbeek's) : Experimental Test of (B. K. Choudhury), 308
Theory and Applications of Nuclear Induction (Prof Ajit Kumar Saha and Tara Prasad Das), *review* by W. M Lomer, 67
Thermal Barrier to the Infectivity of *Entamoeba invadens* in Snakes (Dr. E Meerovitch), 631
Thermal Expansion of Triglycine Sulphate (S. Ganesan), 757
Thermal Expansion Perpendicular to the Layer Planes of Artificial and Natural Graphites : X-Ray Measurement of (E. G. Steward and B. P Cook), 78
Thermo-magnetic Effects in Liquids (R. C. Saxena, J. N. Tandon and S. P. Talwar), 158
Thermonuclear Research : Plasma Physics and, 891
Thin (Ultra-) Sectioning and Electron Microscopy · Study of Life-cycle of *Schizosaccharomyces octosporus* by means of (S. F. Conti and Prof. H B. Naylor), 633
Thin (Ultra-) Sections of Mineralized Human Enamel : Preparation of (R W Fearnhead), 550
Thiobacillus thioparus . Characteristics of (Margaret Townshend and D. White), 870
Thioglycosides (Plant), and the Problem of Endemic Goitre in Australia (H. S. Bachelard and Prof V. M Trikojus), 80
Thiol Exchange System with Thiolbenzoic Acid (I A. M. Ford and S. A. M. Thompson), 9[illegible]
Thiolbenzoic Acid : Thiol Exchange System with (I. A M. Ford and S. A. M. Thompson), 96
Thiols and Disulphides (Irradiated) : Electron Paramagnetic Resonance Observations on (T Henriksen and A. Pihl), 307
Thivy, F : Algology (Use of Marine Algae as Food), 821
Thomas, Dr. E Donnall, and others . *In vitro* Synthesis of Foetal and Adult Haemoglobin by Foetal Haematopoietic Tissues, 396
Thomas, Dr. H. B. G. : Syllabic 'Strategies' in Written Language, 485
Thomas, J. O , and others : Variation of Electron Density in the Ionosphere with Magnetic Dip, 902
Thomas, Dr. Owen L · Electron Microscopy of the Golgi Apparatus, 703
Thompson, Dr. A. R , and Maxwell, Dr. A . Solar Radio Bursts and Low-Energy Cosmic-Rays, 89
Thompson, E M , and others : A New Metabolite of Chloramphenicol, 535
Thompson, Dr G. Caton : *Obituary* of Capt. Guy Gardner, 655
Thompson, R T : Beetles of the British Isles, *review*, 721
Thompson, S A. M. (Ford, I. A. M., and) : Thiol Exchange System with Thiolbenzoic Acid, 96
Thomson, Sir George : Installation as president for 1960 of the British Association for the Advancement of Science, 145
  Awarded the Faraday Medal of the Institution of Electrical Engineers, 431
Thomson, Sir Landsborough : The Birds of the British Isles, *review*, 131
  The Waterfowl of the World, *review*, 567
Thomson, R H. G : Appointed scientific adviser and deputy keeper at the National Gallery, London, 657 ; work of, 657
Thorne, M. P , and others : At the Ninth Canadian High Polymer Forum (The Polymerization of 1-Butene by Metal Alkyl–Titanium Halide Catalysts), 359
Thornton, Dr H G. : Appointed a vice-president of the Royal Society, 74
Thoughts on Communication, *review* by B. Silcock, 130
Thrombin *E* in the Prothrombin Activation Sequence : Significance of (Dr. Walter H. Seegers, Dr. Ricardo H. Landaburu and Dr. J. Frederic Johnson), 930
Thrombosis : Dietary Fats and (Dr. Torben Geill, Dr. Per From Hansen and Dr. Erling Lund), 330
  Pathogenesis of (Dr L. Poller), 937
Thunderstorms · A Convective-Turbulence Theory of (Dr. N. Ramalingam), 900
Thymidine (Tritium-labelled), and Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid : Incorporation of, after Irradiation of the Deoxyribonucleic Acid Primer with γ-Rays (Dr. S. Okada), 193
Thymus Cells (Rat) : Labelling of Deoxyribose with Carbon-14 in relation to Incorporation of Phosphorus-32 into the Nucleotides of Deoxyribonucleic Acid of (Dr. S. Itzhaki), 614
Thyroid Hormones (Dr. Rosalind Pitt-Rivers and Jamshed R. Tata), *review* by Prof. F. G. Young, 721
Thyroidal Control of Radiophosphorus Metabolism in Salmon (P. N. Srivastava), 621
Thyrotropic Fractions (Pituitary) : Neutralization of Human Serum and, with Antisera to Bovine Pituitary Thyrotropin (Dr. Sidney C. Werner, Ephraim Otero-Ruiz, Beatrice C. Seegal and Robert W. Bates), 472
Thyrotropin (Bovine Pituitary) · Neutralization of Human Serum and Pituitary Thyrotropic Fractions with Antisera to (Dr. Sidney C. Werner, Ephraim Otero-Ruiz, Beatrice C. Seegal and Robert W. Bates), 472
Thyroxine : Action of, on the Rate of Oxygen Consumption of the Lung-Fish (*Protopterus*), (Dr. T. Mohsen and Dr. R. Godet), 108
  Synthesis of Tritium-labelled Tyrosine, 3.5-Diiodotyrosine and (Dr. J. R. Tata and A. D. Brownstone), 34
Thyroxine (L- or D-) : Oxygen Consumption by Tissues from Rats injected with (Dr. P. B. Dunne and Dr. D. F. Tapley), 622
Thyroxine Analogues Action of, on Frog Melanocytes (Dr. M. Ruth Wright and Dr. Aaron B. Lerner), 169
Tichy, J. R. : At the Ninth Canadian High Polymer Forum (The Polymerization of Phosphorus Pentachloride and Urea), 359
Tickell, W. L. N. : Chick Feeding in the Wandering Albatross *Diomedea exulans* Linnaeus, 116
Tilley, Prof. C. E. : Awarded the Wollaston Medal of the Geological Society of London, 657
Timakov, Prof. V. D. (edited by) : Microbial Variation (translated from the Russian by G. H. Beale), *review* by Dr. E. F. Gale, 344
Time of Feeding in relation to the Toxicity of a Stomach Poison to the Desert Locust (R D. MacCuaig and W. S. Watts), 335
Time of Residence of Radioactive Debris in the Stratosphere (J. Ambrosen), 301
Time required for Sperm Formation and Epididymal Passage in the Bull : Influence of Ejaculation Frequency on the (Dr. H. H Koefoed-Johnsen), 49
Time/Response Records : Automatic, with *Drosophila* (G. A. Wheatley and J. A Hardman), 708
Timms, Dr. A. R : Host Influence on Parasite Physiology (Work of the Louisiana State University School of Medicine on Schistosome Enzymes), 898
Tin : Dependence on Temperature of Elastic Moduli of (P. Jayarama Reddy and S. V. Subrahmanyam), 29
Tinbergen, Prof Niko . Elected a member of the Zoology Section of the Leopoldina Academy of Sciences, 506
Tissue (Adipose) Lipoprotein Lipase: Significance of (Dr. J. Páv and Dr. J. Wenkeová), 926
Tissue (Ciliary Process) : Comparative Adenylic Acid Deaminase Activity in Choroid Plexus and (Prof Morton B. Waitzman), 388
Tissue (Phaechromocytoma) : Presence of 3-Methoxy-4-hydroxyphenylglycol and Metanephrine in (Dr. Irwin J. Kopin and Dr. Julius Axelrod), 788
Tissue Cultures (Decontaminating), Infected with Pleuropneumonia-like Organisms (Dr. Leonard Hayflick), 783
Tissue Debris (Guinea Pig) : Induction of a Vascular Permeability Factor by the Interaction of, with Serum (Dr. P. J. Mill), 246
Tissue Enzyme Activities . Effects of the Method of Tissue Preparation on the Assay of (Dr. Sjoerd Bonting and Ira M. Rosenthal), 686
Tissue Metabolism *in vitro* : Effect of Chlorpromazine on (Dr. J. Kozák, Dr. A. Zeleny and N. Lang), 107
Tissue Preparation . Effects of the Method of, on the Assay of Tissue Enzyme Activities (Dr. Sjoerd Bonting and Ira M. Rosenthal), 686
Tissue Transplants Implantation of, in the Uteri of Pseudopregnant Mice (Ian B. Wilson), 553
Tissues from Rats injected with L- or D-Thyroxine : Oxygen Consumption by (Dr. P. B. Dunne and Dr. D. F. Tapley), 622
Tissues (Animal) : Enzymatic Cycle of Inorganic Nitrogen in (Dr. K. Yamafuji, Y. Osajima and H Omura), 162
Tissues (Connective) : Presence of Sialic Acid in (A. A. Castellani, G. Ferri, L. Bolognani and V. Graziano), 37
Tissues (Foetal Haematopoietic) : *In vitro* Synthesis of Foetal and Adult Haemoglobin by (Dr. E. Donnall Thomas, Harry L. Lochte, jun., William B. Greenough, III., and Marion Wales), 396
Tissues (Normal and Malignant) : Anaerobic Glycolysis of Dispersed Cell Suspensions from (Dr. M Zimmerman, T. M. Devlin and M. P. Pruss), 315
Titanium Films : Sorption of Activated Gases by (L. Holland), 911

Titanium–Iron Alloys : Oxidation of (J. Stringer, M. G. Cowgill and N. C. Griffiths), 304
Titration (Potentiometric), of H-Montmorillonite : Interpretation of (Dr. A. M. Pommer and Dr. D. Caroll), 595
Titus, Elwood, and others : Effect of Cardiac Glycosides and Inorganic Ions on Binding of Serotonin by Platelets, 99
Tizard, Sir Henry : *Obituary* by Sir Frederick Brundrett, 209
Tizard and the Science of War (Prof. P. M. S. Blackett), 647
Tobias, Prof. Phillip V. : The Kanam Jaw, 946
Tolansky, Prof. S., and Sunagawa, Dr. I. Interferometric Studies on Synthetic Diamonds, 203
Tolerance in Rabbits : Runt Disease and (K. A. Porter), 789
Toluenes (γ-Irradiated, Substituted) Electron Spin Resonance of (N K. Bridge), 30
Tonna, Dr. E. A. : Periosteal Osteoclasts, Skeletal Development and Ageing, 405
Tool-Chest (Crystallographer's) of Mathematics, *review* by Dr. A. R Stokes, 129
Tooms, Dr. John S. : Petroleum Geology, *review*, 876
Tooth (Supposed Giant Deciduous Hominid), from Olduvai : An Alternative Interpretation of the (Dr. J. T. Robinson), 407 ; (Dr. L. S B. Leakey), 408
Tosteson, Dr. D. C., and others : Retention of Potassium by Human Erythrocyte Ghosts, 186
Total Irradiation of Rats : Early Injury of Chromoexcretion after (Zdenek Dienstbier and Oskar Ándrysek), 630
Tousignant, W. F., and others : At the Ninth Canadian High Polymer Forum (Poly-N-vinyl, 5-Methyl 2-Oxazolidone /PVOM), a New Complexing Polymer), 359
Townshend, Margaret, and White, D. : Characteristics of *Thiobacillus thioparus*, 870
Toxic Chemicals in Agriculture and Food Storage : Use of (Appointment by the Minister of Agriculture, Fisheries and Food, with the Minister for Science, the Secretary of State for Scotland and the Minister of Health of a Research Study Group to consider the), 578
Toxicity of Plastics (Dr. S. F. Chancellor), 841
Toxicity of a Stomach Poison to the Desert Locust : Time of Feeding in relation to the (R. D. MacCuaig and W. S. Watts), 335
Toxin of the Portuguese Man-of-War . Interaction between the Plasma of the Loggerhead Turtle and (Dr. Eleanor Dodge Wangersky and Prof Charles E. Lane), 330
Tracer Studies (High Specific Activity) : A Pitfall in (Dr. E. Hell, Dr. R. J. Berry and Dr. L. G. Lajtha), 47
Track of Unknown Animals : On the (Dr. Bernard Heuvelmans), translated from the French by Richard Garnett, *review* by R. W Hayman, 643
Trager, Dr Wm. : Host Influence on Parasite Physiology, 897
Train, Dr. David : Non-Metallic Brittle Materials, *review*, 344
Training in the Use of Isotopes, 13
Training Apprentices, *review*, 566
Training Skilled Workers (T. H. Hawkins), 509
Training Teachers : Commonwealth Assistance in, 812
Training Unskilled and Semi-Skilled Operatives in Manufacturing Industry (W. D. Seymour), 509
Training (Education and), in Nutrition in Europe (Food and Agriculture Organization and the World Health Organization of the United Nations Symposium on), 585
Training (Teacher), in Britain, 432
Trans-Pacific Telephone Cable, 431
Transduction (Intrastrain), in *Proteus mirabilis* (Prof J. N. Coetzee and T. G. Sacks), 869
Transfer : Heat (the late Prof. Max Jakob), Vol. 2 (with the technical and editorial assistance of Prof. S. P. Kezios), *review* by R. W. Haywood, 66
Transfer of Germ-Cells in *Xenopus laevis* (Dr. Antonie W. Blackler), 859
Transfer of Isolated Cells : Inhibition of the Inductive Phase of Antibody Formation by 6-Mercaptopurine examined by the (Dr. J. Sterzl), 256
Transfer into Sea-Water : Variations in the Plasma-Level of Chloride in Hatchery-reared Yearling Atlantic Salmon during Parr–Smolt Transformation and following (Prof. Arthur H. Houston), 632
Transfer (Chain), in Mixed Solvent Systems (Uma Shankar Nandi and Santi R. Palit), 235
Transfer (Film), in He II (Prof. J. F. Allen), 831
Transfer (Heat) : An Introduction to Fluid Mechanics and—with Applications in Chemical and Mechanical Process Engineering (Prof. J. M. Kay), *review* by R. W. Haywood, 66
Transfer (Heat), and Heat Exchangers, *review* by R W Haywood, 66
Transformation of Cells : Experimental (Dr. Honor B. Fell), 882
Transformation (Parr–Smolt) : Variations in the Plasma-Level of Chloride in Hatchery-reared Yearling Atlantic Salmon during, and following Transfer into Sea-Water (Prof. Arthur H. Houston), 632
Transforming Deoxyribonucleic Acid : Shape of Ultra-Violet Inactivation Curves of (Claud S. Rupert and Sol H. Goodgal), 556
Transglucosidase Activity in *Acetobacter xylinum* (Sigrid Klungsoyr), 104
Transition Elements : Variation with Temperature of the Magnetic Susceptibility of some (Dr H. Kojima, Dr. R. S. Tebble and D E. G. Williams), 90
Translocation of Flavonoids : Effect of Glycosylation on the Enzymic Oxidation of (Dr. E. A. H. Roberts), 536
Transmethylation in *Anodonta cygnea* (L -E. Ericson), 465
Transmissible Hereditary Disease of Sheep : Scrapie, a (H. B. Parry), 441
Transmission (Differential), of Gametes in Wheat (N. H. Luig), 636
Transmitted Secondary Electron Multiplication : An Image Intensifier with (W. L. Wilcock, D. L. Emberson and B. Weekley), 370
Transplantable Tumours in Mice . Cementing Substances in Metastasizing and Non-Metastasizing (G Gasić, F. Loebel and O. Badínez), 864
Transplants (Functional Pituitary), in Rats (Dr. P. N. Martinovitch and D. Pavić), 155
Transplants (Tissue) : Implantation of, in the Uteri of Pseudopregnant Mice (Ian B. Wilson), 553
Transport (Selective Biological Membrane), of Individual Amino-Acids (Dr. S. M. Hardy), 245
Transvaal Museum : *Bulletin*, July 1959, 214
  Annual Report for 1958-59, 355
Trapping (Energy-) Centres in Photosynthesis (F. W. J. Teale), 775
Traps of Nematophagous Fungi : Induction of, using *Panagrellus redivivus* (Dr. Armen C. Tarjan), 779
Traps (Bait and Light) : Physiological Age of Codling Moth Females (*Cydia pomonella* L.) caught in (P. W. Geier), 709
Trauma (Blood), in Extracorporeal Circuits : Renal Affection resulting from (Dr. H. S. S Sarajas and Dr. L. Saure), 768
Travelling Waves : Effect of Corona on (Dr. M. Ouyang), 524
Treatment with Chlorpromazine and Dihydroergotamine : Fall in Haematocrit in Sheep after (Dr. A. W. Turner and V. Elizabeth Hodgetts), 43
Treatment of Poisoning by Polymerizable Radioelements : Chelating Agents in the (Jack Schubert and Joan F. Fried), 551
Treatment of Tumours in Animals and Man : Actinomycins and their Importance in the (New York Academy of Sciences Conference on), 76
Treatment of Wood with Metal Salts . Metal-Organic Complexes formed during the (C. H. Bayley and Grace R F Rose), 313
Trees (Apple) : Nitrogen Feeding of, by Post-Harvest Urea Sprays (Dr. K. Oland), 857
Tremaine, J. H., and others : Stone-Fruit Viruses, 660
'Treysa' (Iron Meteorites 'Carbo' and) : Calculation of Cosmic-Ray Ages in the (Dr. H. Voshage and Dr. H. Hintenberger), 88 , (Dr. Royal R. Marshall), 89
Trieste : United States Bathyscaphe, 285
Triethyl α-Fluoroaconitate (Ernst D. Bergmann and I. Shahak), 529
T. subterraneum : Effect of Micro-organisms on the Development of Roots and Root Hairs of Subterranean Clover (A. D. Rovira and G. D. Bowen), 260
Triglycine Sulphate : Thermal Expansion of (S. Ganesan), 757
Trikojus, Prof. V. M. (Bachelard, H. S., and) : Plant Thioglycosides and the Problem of Endemic Goitre in Australia, 80
Trincao, Prof. Carlos, and others : A Survey of Abnormal Haemoglobins in Portuguese Guinea, 326
Tri*para*ethylphenyl Phosphate : Ataxia in Hens poisoned with (Ann Silver), 247
Triphosphate (Adenosine) : Vasodepressor Effect of Adenosine Phosphates and 5'-Adenylmethylenediphosphonic Acid, an Analogue of (James W Flesher, Dr. Y. T. Oester and T. C. Myers), 772
Tritiated Uridine : Incorporation of, into Amphibian Eggs (N. Bieliavsky and R. Tencer), 401
Tritium : An Autoradiographic Study of the Distribution in Mice of Œstrogens labelled with Carbon-14 and (Dr. J. C. De Paepe), 264
Tritium Content of Atmospheric Molecular Hydrogen : Growth of the (K F Bishop and B. T Taylor), 26
Tritium-labelled Thymidine and Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid : Incorporation of, after Irradiation of the Deoxyribonucleic Acid Primer with γ-Rays (Dr. S Okada), 193
Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid : Incorporation of Tritium-labelled Thymidine and, after Irradiation of the Deoxyribonucleic Acid Primer with γ-Rays (Dr. S. Okada), 193
Tritium-labelled Tyrosine, 3·5-Diiodotyrosine and Thyroxine : Synthesis of (Dr. J. R. Tata and A D. Brownstone), 34
Tritium Nuclear-labelled Morphine (Radio-chemically Pure) : Preparation of (Anand L. Misra and Prof. L. A Woods), 304
Trochilidés : La Vie des Colibris—les (Ariane Martin et Anne Musy), *review* by J D. Macdonald, 67
Troiano, Dr A. R. (Scott, Dr T E , and) Interstitials and Fracture of Metals, 372
Troll, C. : The Biology of the Southern Cold Temperate Zone, 205
Trophoblast (Placental) : Origin of (Dr. Israel Gordon), 118
Tropical Ecology, International Society of : Inauguration of the, 433
  Election of Officers for 1960-61, 433
Tropical Grass–Legume Pasture : Symbiotic Nitrogen Fixation in a Grazed (Dr. A W. Moore), 638
Tropical Marine Molluscs from America, *review* by I. C J. Galbraith, 275
Tropical Medicine and Hygiene, Royal Society of : Symposium on the Evolution of Arborvirus Diseases, 740
Tropical West America : Sea Shells of (Prof. A Myra Keen), *review* by I. C. J. Galbraith, 275
Tropine-α-Methyltropate : Anticholinergic Activity of (G Maffii and G Bianchi), 844
Tropospheric Radio Propagation : Inadequacy of Scatter Mechanisms in (P C. M de Belatini), 76
Trout Streams (Rhodesian) : Quantitative Estimations of Populations of the River Crab, *Potamon (Potamonautes) perlatus* (M. Edw), in (Peter St. J. Turnbull-Kemp), 481
Trypanosoma brucei : A Soluble Protective Antigen of (B. G. F. Weitz), 788
Trypsin and Chymotrypsin : Casein labelled with Iodine-131 as a Substrate for the Measurement of (Dr. Bernard J. Katchman, Dr. Robert E. Zipf and Dr George M. Homer), 238
Trypsin-like Enzyme in Mast Cells : Histochemical Demonstration of a Species-Specific (G. G. Glenner and L. A Cohen), 846
Tryptophan : Spectrophotometric Determination of, by the Method of Roth and Schuster—some Sources of Error (Ivan Larsen), 316
Tryptophan in the Brain : Distribution of (Shirley A. P. Price and Dr. G. B. West), 470
Tryptophan Biosynthesis : Feedback Control of (Dr. C H. Doy and A. J. Pippard), 941
Tryptophanase Activity : Effect of Sulphydryl Group Reagents on (J. M. Turner and Prof. Frank C. Happold), 763
Tsai, Tien-Hu, and others . Chemical and Serological Relationships of certain Bacterial Polysaccharides containing Sialic Acid, 597
Tsetse Flies in Nigeria : Nocturnal Detection of, with Ultra-Violet Light (W McDonald), 867
Tsuruta, M. (Shirasaka, M , and) : 11α.Hydroxylation of Steroids by *Streptomyces* Species, 845
Tubes (Narrow) : Blood Flow through (Dr. Robert H. Haynes), 679
Tubules and Testicular Function . Relation of Leydig Cells in the Human Testicle to the (J. B. W. Halley), 865
Tucker, Prof. D. G., and Welsby, Dr. V. G. : Electronic Sector-Scanning Asdic, an Improved Fish-Locator and Navigational Instrument, 277
Tucker, Dr. Denys W . The Atlantic Eel Problem, 591
Tuddenham, Dr. W. M. (Lyon, Dr R. J P., and) : Determination of Tetrahedral Aluminium in Mica by Infra-Red Absorption Analysis, 374
  Infra-Red Determination of the Kaolin Group of Minerals, 835
Tulloch, Prof. W. J. : Elected a Fellow of the Royal Society of Edinburgh, 734
Tumour Cells (Ehrlich Ascites) : Action of Antibodies and Plasmin on (Dr. I. Ginsburg and M Ram), 328

Tumour Cells (Ehrlich's Ascites) : Activity of a Substance extracted from the Fermentation Products of *Acetobacter aceti* on (G. A. Lanzani and A. Pecile), 175
Tumour Immunity : A New Approach to (Dr. Kurt Stern), 787
Tumour (Anti-) Activities of Copper Chelates (Dr. Kazuhiko Takamiya), 190
Tumours in Animals and Man : Actinomycins and their Importance in the Treatment of (New York Academy of Sciences Conference on), 76
Tumours in Mice : Cementing Substances in Metastasizing and Non-Metastasizing Transplantable (G. Gasić, F. Loebel and O. Badinez), 864
Tumours (Ear), in Rabbits receiving Strontium-90 (Dr H. A. Sissons and Dr. Janet Vaughan), 399
Tungsten . Embrittlement of, and of Molybdenum (P. J. Burdon and G. L. Davis), 455
Tunnel Diodes, 814
Tunnel Diodes : Gallium Arsenide (K. G Hambleton, J. J. Low and R. J. Sherwell), 676
Turbulence (A Convective-) Theory of Thunderstorms (Dr. N. Ramalingam), 900
Turchányi, Gy., and Horváth, T. : Evaporation Figures on the Surface of Sodium Chloride Crystals, 601
Turk, L. M , and others : Fundamentals of Soil Science, third edition, *review* by Dr. R. M. S. Perrin, 2
Turkey Liver Homogenates : Isolation of Radioactive Vitamin B$_{12}$ from Incubation Mixtures containing Glycine-2-^{14}C and (Pran Vohra and F. H. Kratzer), 45
Turkish Bibliography of Articles appearing in Turkish Periodicals for January–March 1959, 356
Turnbull-Kemp, Peter St. J. : Quantitative Estimations of Populations of the River Crab, *Potamon* (*Potamonautes*) *perlatus* (M. Edw.), in Rhodesian Trout Streams, 481
  Albinism in *Cryptomys hottentotus* Lesson, 1826, 555
Turner, A. G , and others : Use of Liqurfied Petroleum Gases (Composition and Properties of 'L P.G '), 580
Turner, Dr. A. W., and Hodgetts, V. Elizabeth : Fall in Haematocrit in Sheep after Treatment with Chlorpromazine and Dihydroergotamine, 43
Turner, J. M., and Happold, Prof. Frank C. : Effect of Sulphydryl Group Reagents on Tryptophanase Activity, 763
Turnover of the Copper and Protein Moieties of Ceruloplasmin (Prof. David Gitlin and Charles A. Janeway), 693
Turnover (Protein), in an Embryonic System : Evidence for (Dr. Harry R. Walter and Prof H. R. Mahler), 398
Turtle (Loggerhead) : Interaction between the Plasma of the, and Toxin of the Portuguese Man-of-War (Dr. Eleanor Dodge Wangersky and Prof. Charles E Lane), 330
Tutin, Prof. T. G. : Introductory Address to the meeting of the Flora Europaea Organization in Vienna, 15
  Centenary of the 'Origin of Species'—some Botanical Aspects, 216
Tutin, W. : Plant Physiology in the Field, *review*, 799
Tuve, Dr. M. A. Basic Research, 716
Twig of Woody Plants : Survival of the, at —196°C. (Dr. Akira Sakai), 393
Two-Phase Systems (Liquid) : Antigen–Antibody in—a Method for Studying Immunological Reactions (Per-Åke Albertsson and Lennart Philipson), 38
Tyler, J. K., and others : Microwave Spectrum of Fluorine Cyanide, 96
Types of Milk (Different) : Effect of, on Intestinal Motility (Prof. A. H. Mohamed, O. Zaki, K. Zaki and L. Fahim), 773
Types (Different), of Muscle Effect of Heavy Water on, and on Glycerol-extracted Psoas Fibres (Dr. Benjamin Kaminer), 172
Tyrosine labelled with Carbon-14 . Effect of Streptomycin on the Incorporation of, into Protein of *Mycobacterium* Cell Fractions *in vivo* (Dr. T. Erdos and Dr. Agnes Ullmann), 100
Tyrosine (Tritium-labelled), 3:5-Diiodotyrosine and Thyroxine : Synthesis of (Dr. J R. Tata and A. D Brownstone), 34
Tyson, H. (Durrant, Dr. A , and) Conditioned Lines of Flax, 60

UBBINK, J , and others . Dielectric Devices (Characteristics of a 1,420 Mc./s. Maser), 360
Uganda in Black and White (Dr. Hugh B Cott), *review* by M. C. Burkitt, 567
Uhler, Dr. R L. (Pendleton, Dr R. C., and) : Accumulation of Caesium-137 by Plants grown in Simulated Pond, Wet Meadow and Irrigated Field Environments, 707
Ullmann, Dr Agnes (Erdos, Dr T., and) : Effect of Streptomycin on the Incorporation of Tyrosine labelled with Carbon-14 into Protein of *Mycobacterium* Cell Fractions *in vivo*, 100
Ultra-High-Frequency Signal Traversing an Auroral Disturbance . Observed Characteristics of an (J C. James, L E Bird, R. P Ingalls, M L. Stone, J. W. B. Day, G. E K Lockwood and R I Presnell), 510
Ultrasonic Insonation Effect of, on the Carbon Tetrachloride–Water–Dissolved Helium System (Martin R Levy), 159
Ultrasonic Propagation, *review* by Prof E. G. Richardson, 3
Ultrasonic Velocities in Aqueous Solutions of Cadmium Iodide and Mercuric Chloride (S V. Subrahmanyam), 371
Ultrasonic Waves Absorption and Dispersion of (Karl F. Herzfeld and Theodore A Litovitz), *review* by Prof E. G Richardson, 3
Ultra-Thin Sectioning and Electron Microscopy : Study of Life-cycle of *Schizosaccharomyces octosporus* by means of (S. F Conti and Prof. H. B Naylor), 633
Ultra-Thin Sections of Mineralized Human Enamel Preparation of (R. W. Fearnhead), 550
Ultra-Violet Inactivation Curves of Transforming Deoxyribonucleic Acid : Shape of (Claud S Rupert and Sol H. Goodgal), 556
Ultra-Violet-induced Mutations Correlation of Loss of Photoreversibility of, with Deoxyribonucleic Acid Synthesis (Dr F L Haas and Dr. C. O. Doudney), 637
Ultra-Violet Irradiated Films of Nucleic Acids . Aggregation and Staining Behaviour of (Prof. D Shugar and Dr J Baranowska), 33
Ultra-Violet Light : Effect of, on the Shape and Size of Deoxyribonucleic Acid (Dr. P. Alexander and Dr. H. Moroson), 678
  Nocturnal Detection of Tsetse Flies in Nigeria with (W. McDonald), 867
Umbreit, Wayne W. (edited by) : Advances in Applied Microbiology, Vol. I, *review* by Dr J W G Porter, 565
Unesco : Proceedings of the International Conference on Radioisotopes in Scientific Research, Paris, 1957 (edited by Prof R. C. Extermann), Vol. 1, Research with Radioisotopes in Physics and Industry ; Vol. 2, Research with Radioisotopes in Chemistry and Geology, *review* by Dr H Seligman, 415 ; Vol 3, Research with Radioisotopes in Human and Animal Biology and Medicine , Vol. 4, Research with Radioisotopes in Plant Biology and some General Problems, *review* by Prof. Otto Hug, 876
  Symposium on Water Relationships of Plants in Arid and Semi-Arid Conditions, 435
Unesco and the Indian Council of Agricultural Research : Symposium on Algology, 820
Unesco Science Co-operation Offices for South and South-East Asia : Bibliography of Scientific Publications of South and South-East Asia, Nos. 7, 8 and 9, 146 ; No. 11, 582
Uniform Daily Rotation : Response of Growing Plants to a (R L. Jones), 775
Unique 'Parthenita' in *Littorina saxatilis* (Olivi) : A New Cercaria of the Subfamily Gymnophallinae (Trematoda : Digenea) developing in a (B L. James), 181
United Kingdom : Energy in the—the Changing Scene (Sir Harold Hartley), 896
  Relationship between the Rate of Fall-out and the Concentration of Strontium-90 in Human Diet in the (Dr. J. D Burton, G. M. Milbourn and Dr R Scott Russell), 498
United Kingdom Atomic Energy Authority : Commencement of Operations of the *Zenith* Reactor at Winfrith Heath, 12
  Appointment of H. Cartwright as director of industrial power in the Development and Engineering Group, 354
  Research Reactor *Herald* at Aldermaston, 735
  Professional Staff employed by the, 737
United Kingdom Hospital Library Services, 589
United Kingdom Metal Mining Association (Institution of Mining and Metallurgy and the) : Proceedings of a Symposium on the Future of Non-Ferrous Mining in Great Britain and Ireland (1958), *review* by Prof. K. C. Dunham, 801
United Nations Collaboration in the Sociological Sciences, 561
United Nations (Food and Agriculture Organization) : Appointment of Dr. A W. Meschkat as regional fisheries officer for Africa, 356
United Nations (Food and Agriculture Organization and the World Health Organization) : Symposium on Education and Training in Nutrition in Europe, 585
United Nations (World Health Organization) : Report on Communicable Diseases in School, 736
United States Employment of Scientists in the, 890
  Funds for Research and Development in the (United States National Science Foundation), 813
  Science and Foreign Policy in the, 584
  Scientific Societies in the, 579
United States Army (Office of Ordnance Research) : Symposium on Plastic Crystals and Rotation in the Solid State, 356
United States Atomic Energy Commission, and others : Conference on the Role of Nuclear Propulsion in our Future Merchant Marine, 582
United States Council for the Advancement of Science Writing : Establishment of a, 735
  Election of Officers, 735
United States Department of State : Appointment of Scientific Officers for United States Embassies, 657
United States Embassy in Buenos Aires : Appointment of Prof Neal Weber as science officer, 657
United States Embassy in London : Appointment of John B. Bateman as deputy science officer, 657
United States Embassy in New Delhi : Appointment of Earnest Watson as science officer, 657
  Appointment of David C. Rife as deputy science officer, 657
United States Embassy in Rio de Janeiro : Appointment of Harry W. Wells as science officer, 657
United States Embassy in Stockholm . Appointment of William Littlewood as deputy science officer, 657
United States Embassy in Tokyo : Appointment of Prof Marshall Crouch as deputy science officer, 657
United States Foreign Policy—Possible Nonmilitary Scientific Developments and their Potential Impact on Foreign Policy Problems of the United States (A Study prepared at the request of the Committee on Foreign Relations, United States Senate, by Stanford Research Institute), 561
United States National Museum Annual Report for 1958-59, 891
United States National Academy of Sciences (National Research Council) : Appointment of Dr Kinzel as chairman of the Division of Engineering and Industrial Research, 14
United States National Academy of Sciences (American Geophysical Union of the) Formation of a Planning Committee on Planetary Sciences, 658
United States National Academy of Sciences, and others . Symposium on Basic Research (edited by Dael Wolfle), 716
United States National Institutes of Health Grant of 1,100,000 dollars from the National Heart Institute to Dr. David K. Detweiler, for research and training in comparative cardiovascular studies, 433
United States National Research Council (National Academy of Sciences) : Appointment of Dr. Kinzel as chairman of the Division of Engineering and Industrial Research, 14
United States National Science Foundation : Fellowship Awards for 1960, 145
  Scientists and Engineers in American Industry, 213
  Federal Funds for Science, 1958, 1959 and 1960, 813
  Funds for Research and Development in the United States, 813
  American Science Manpower—Employment and other Characteristics (1954-55), 890
United States Naval Headquarters : Exhibit on Rocket Astronomy lent to the Science Museum, London, 215
United States Navy : Dive of the Bathyscaphe *Trieste*, 285
United States Office of Science Information Service . *Scientific Information News*, Vol 1, No 4, 579

  Science and Foreign Policy in the United States, 584

- Units (Sub-) in Southern Bean Mosaic Virus (Dr. Beatrice S. Magdoff), 673
- Univalent Cobalt Complexes (New), of the $[Co^{I}(CN)_5X]$ Type (Dr. Nobufumi Maki), 683
- Universities : Administration of (Prof C. Northcote Parkinson), 816
- Universities Federation for Animal Welfare · Annual Easter Congress, 893
  - Symposium on Humane Experimental Technique, 893
- University of Belfast . Appointment of Dr. D. J. Carr to the chair of botany, 286
  - Appointment of Dr. R. A. Henstock as senior lecturer in pure mathematics, 286
  - Appointment of Dr. A. L. Stewart as lecturer in applied mathematics, 286
- University of Birmingham : Residential Conference on Dielectric Devices, 360
  - Agreement with the University College of Rhodesia and Nyasaland that when a Medical School is established at Salisbury the School will initially be an affiliated institution of the University, 433
  - Appointment of J. C. Maltbaek as a lecturer in chemistry, 433
  - Appointment of Dr. D S Urch as a lecturer in chemistry, 433
  - Appointment of G. C -Y. Hu as lecturer in highway and traffic engineering, 433
  - Appointment of Dr. C. G. Wall as lecturer in chemical engineering, 433
  - Appointment of G. H. J. Bennett as lecturer in industrial metallurgy, 433
  - Appointment of R. S. J. Good as lecturer in mechanical engineering, 433
  - Faculty of Commerce and Social Science to be accommodated in a new building, 892
  - Work on the building for the Department of Biology, 892
  - Appointment of Dr J. T. Davies to the chair of chemical engineering and to the headship of the Department of Chemical Engineering, 892
  - Appointment of Dr. Gillian Vaisey as lecturer in the Department of Civil Engineering, 892
  - Appointment of G. Lees as lecturer in road materials in the Department of Civil Engineering, 892
  - Appointment of D. R. Milner as Lucas Fellow in metal joining in the Department of Industrial Metallurgy, 892
  - Readership in reactor physics conferred on Dr. J. Walker, 892
  - Readership in social medicine conferred on Dr C. R Lowe, 892
- University of Bombay · Department of Chemical Technology (Prof H. E. Watson), 661
- University of Bristol Appointment of J. W Flower as lecturer in aeronautical engineering, 736
  - Appointment of Dr. W. M. Gibson as senior lecturer in physics, 736
  - Grants from the Department of Scientific and Industrial Research—of £15,000 for an electron microscope, and £3, 850 for an investigation in the Department of Physical and Inorganic Chemistry on the electronic spectra of ionized hydrocarbons, 736
  - Grant of £2,291 from the Royal Society to the Department of Physical and Inorganic Chemistry, for the purchase of a high-temperature resistance vacuum furnace, 736
  - Gift from the Bingham Oceanographic Laboratories of Yale University of biological material to the value of £2,800 to the Department of Pharmacology, 736
  - Annual Report of the Agricultural and Horticultural Research Station (the National Fruit and Cider Institute), Long Ashton, Bristol, for 1958, 743
- University of Cambridge : Appointment of Prof. P. V. Danckwerts to the Shell chair of chemical engineering, 14
  - Shell Department of Chemical Engineering, 287
  - Appointment of Dr. Kenneth McQuillen as College lecturer in biochemistry in Churchill College, 433
  - Kenneth Craik Research Award by St. John's College for postgraduate research, preferably in physiological psychology, 736
- University of Cambridge (Prof. R. A. McCance and the Department of Experimental Medicine) : Course on the Clinical Aspects of Nutrition, 507
- University of Cambridge Sociological Society : Academic Careers of Entry of 1955, 218
- University of Durham : Refresher Course on Science in Schools, organized by the Department of Extra-Mural Studies and Education, King's College, Newcastle-upon-Tyne, in conjunction with the North-Eastern Association of the British Federation of University Women, 286
  - Grant from the University Grants Committee for orders to be placed for nearly £40,000 worth of additional equipment for the University Computing Laboratory at Newcastle-upon-Tyne, 433
- University of Ghent (Agricultural College of the) : Twelfth International Symposium on Crop Protection, 286
- University of Illinois (Natural History Survey Division) : Biological Notes No. 40, Technique for Capturing Birds and Mammals (Ronald F. Labisky), 659
- University of Khartoum : Report for 1956-58 of the Natural History Museum, 736
- University of Leeds : Establishment by the Medical Research Council of the Environmental Radiation Research Group in the Department of Medical Sciences, 215
  - Appointment of Dr. J. Nutting as professor of metallurgy, 892
  - Appointment of D. R. Wood as professor of pharmacology, 892
  - Appointment of J. M. Cameron as professor of philosophy, 892
  - Grants from the Department of Industrial and Scientific Research—of £40,000 to the Department of Physics, for research on cosmic ray showers, of £5,650 to the Department of Leather Industries, and £2,200 to the Department of Electrical Engineering, 892
  - Grant of £2,000 from the Ministry of Aviation to the Houldsworth School of Applied Science, for research on the fatigue properties of ferrous and non-ferrous alloys, 892
  - Grant of £1,500 from Imperial Chemical Industries, Ltd. to the Department of Inorganic and Structural Chemistry, to support X-Ray structure analysis, 892
  - Grant of £1,000 from Hickson's Timber Impregnation Co (G.B.), Ltd., to provide a fellowship in the Department of Botany, 892
- University of Liverpool : Retirement of Prof. J M. Cassels from the chair of physics, 284
  - Appointment of Dr. A W. Merrison to the chair of chemistry, 284
- University of London : Appointment of Prof K. G Denbigh to the University chair of chemical engineering science at the Imperial College of Science and Technology, 14
  - Appointment of Dr. G. H. Williams to the University readership in organic chemistry at Birkbeck College, 14
  - Retirement of Prof. J. H. Woodger as head of the Department of Biology in the Middlesex Hospital Medical School, 75
  - Appointment of Prof. D. R. Newth as head of the Department of Biology in the Middlesex Hospital Medical School, 75
  - Lectures on the Scientific Basis of Medicine (British Postgraduate Medical Federation), Vol. 7, 1957-58, *review* by Prof R. A. McCance, 202
  - Research Methodology at the London School of Economics (Prof. M G. Kendall), 208
  - Appointment of Dr. G. V. R. Born to the Vandervell chair of pharmacology in the Institute of Basic Medical Sciences, 214, 430
  - Appointment of Dr. D. L. J. Bilbey and Dr. R M. H. McMinn to readerships in anatomy at King's College, 214
  - Title of professor in economics in the University (at the London School of Economics and Political Science) conferred on B S. Yamey, 214
  - Title of reader in physics in the University (at King's College) conferred on Dr. D. M. MacKay, 214
  - Course of Lectures on Reactor Fuel Element Technology at the Imperial College of Science and Technology, 215
  - Inaugural Lectures delivered at the Imperial College of Science and Technology during 1956-57 and 1957-58, 433
  - Appointment of Dr R. G. Lipsey to the University readership in economics at the London School of Economics and Political Science, 433
  - Title of reader in economics in the University (at the London School of Economics and Political Science) conferred on Dr. K. J. Lancaster, 433
  - Appointment of Dr. H O. Schild to the University chair of pharmacology in University College, 506, 811
  - Appointment of Dr. W F. Widdas to the University chair of physiology at Bedford College, 506, 656
  - Appointment of Dr. H Lehmann to the University readership in chemical pathology at St. Bartholomew's Hospital Medical College, 506
  - Title of reader in chemical pathology in the University (at Guy's Hospital Medical School) conferred on Dr. G R. Webster, 506
  - Retirement of Prof Margaret Murray from the chair of physiology at Bedford College, 656
  - Appointment of P. T. Bauer to the University chair of economics (with special reference to underdeveloped countries and economic development) at the London School of Economics and Political Science, 737
  - Appointment of C B Winsten to the University readership in statistics at the Imperial College of Science and Technology, 737
  - Appointment of Dr. J. H. Green to the University readership in physiology at Middlesex Hospital Medical School, 737
  - Retirement of Prof F. R. Winton from the University chair of pharmacology in University College, 810
  - Postgraduate Diploma Course in Conservation at University College, 814
  - Summer School of Health Physics (Radiation Protection), at the Imperial College of Science and Technology, 815
  - Benefaction of £350,000 from the Isaac Wolfson Foundation to the Imperial College of Science and Technology, to build and equip new laboratories for biochemistry and chemical microbiology, 895
  - Appointment of Dr. E. B. Chain to the chair of biochemistry in the Imperial College of Science and Technology, 895
- University of London Institute of Basic Medical Sciences · Appointment of Dr G V R. Born to the Vandervell chair of pharmacology, 214, 430
- University of Manchester : Appointment of Dr. M. R. Horne as professor of civil engineering, 212
- University of Monash, Melbourne : Appointment of Prof J. A L Matheson as vice-chancellor. 212
  - Appointment of Dr. A. J Marshall as professor of biology, 286, 734
  - Appointment of Dr. R. D. Brown as professor of chemistry, 286
- University of Naples · International Spring School of Physics of the Istituto di Fisica Teoretico, 893
- University of Nottingham · Appointment of Dr. R. W. Hepburn to the chair of philosophy, 737
  - Appointment of Prof W. J. H. Sprott to the newly established chair of psychology, 737
- University of Oxford : Grant of £4,000 from the Forestry Commission, for the continuation of an investigation into the costs of private forestry and economic information concerning private forestry estates in England and Wales, 506
  - Summer School in Theoretical Chemistry, 582
  - Classical Languages in Oxford Requirements, 660
  - Retirement of Prof. E. G. T. Liddell from the Waynflete chair of physiology, 733
  - Appointment of Sir Lindor Brown to the Waynflete chair of physiology, 733
  - Retirement of Prof. H H Plaskett as Savilian professor of astronomy and director of the University Observatory, 733
  - Appointment of Prof D. E. Blackwell as Savilian professor of astronomy and director of the University Observatory, 733
- University of St Andrews · Appointment of Dr R. B. Dingle to the new chair of theoretical physics in St. Salvator's College, 430
- University of Sheffield : Appointment of Dr. John Knowelden to the chair of preventive medicine and public health, 12
  - Appointment of J. K. Page to the newly created chair of building science, 144
  - Appointment of Dr. H. Ruben as senior lecturer in charge of the Department of Statistics, 737
  - Appointment of Dr. D. M. Burley as lecturer in applied mathematics, 737
  - Appointment of Dr. Margaret M. Platts as lecturer in medicine, 737
  - Appointment of H. A. Salmon as lecturer in physiology, 737
- University of Southampton . Grant of £2,000 per annum for seven years, from the Institution of Structural Engineers, to provide for the establishment of a readership in structural engineering in the Department of Civil Engineering, 215

University of Toronto Symposium on Inorganic Chemistry, 433
University of Wales · Resignation of Prof E. S Sellers as head of the Department of Chemical Engineering, University College of Swansea, 578
  Appointment of Prof J F. Richardson as head of the Department of Chemical Engineering, University College of Swansea, 578
  Third Symposium on Aspects of Agricultural Meteorology, at University College, Aberystwyth (Upland Climate and Land Usage, with special reference to Highland Britain), 737
University of Wisconsin Publications in Medieval Science, Vol 4, The Science of Mechanics in the Middle Ages (Marshall Clagett), *review* by Prof. E. J Dijksterhuis, 491
University College, Aberystwyth Third Symposium on Aspects of Agricultural Meteorology (Upland Climate and Land Usage, with special reference to Highland Britain), 737
University College, London : Appointment of Dr. H. O Schild to the University of London chair of pharmacology, 506, 811
  Retirement of Prof. F. R. Winton from the University of London chair of pharmacology, 810
  Postgraduate Diploma Course in Conservation, 814
University College of North Staffordshire : Appointment of Dr D E Davies to a senior lectureship in physics, 737
  Appointment of Dr J P. de C. Day to a senior lectureship in philosophy, 737
  Appointment of Dr. D. S Lees to a senior lectureship in economics, 737
  Appointment of Dr. R. McWeeny to a senior lectureship in theoretical chemistry, 737
  Appointment of A. C. Montefiore to a senior lectureship in political and moral philosophy, 737
  Appointment of W M Williams to a senior lectureship in geography, 737
University College of Rhodesia and Nyasaland : Agreement with the University of Birmingham that when a Medical School is established at Salisbury the School will initially be an affiliated institution of the University of Birmingham, 433
University College of Sierra Leone . Fourah Bay College (Dr. F. J Taylor and Dr. E. Downing), 884
University College of Swansea . Resignation of Prof E S Sellers as head of the Department of Chemical Engineering, 578
  Appointment of Prof. J. F. Richardson as head of the Department of Chemical Engineering, 578
University Education in Central Africa (Prof F. G Young), 816
University Grants Committee · Appointment of Sir Eric Ashby, Prof F W Rogers Brambell, Prof C. H Philips and Prof. J. Monteath Robertson as members, 12
  Grant to the University of Durham to enable it to place orders for nearly £40,000 worth of additional equipment for the University Computing Laboratory at Newcastle-upon-Tyne, 433
University Standards : Academic Freedom and, 795
University Students and their Academic Origin (R. K. Kelsall), 218
University Women, North-Eastern Association of the British Federation of (Department of Extra-Mural Studies and Education of King's College, Newcastle-upon-Tyne, in conjunction with the) : Refresher Course on Science in Schools, 286
Unknown Animals . On the Track of (Dr Bernard Heuvelmans), translated from the French by Richard Garnett, *review* by R. W Hayman, 643
Unsaturated Compounds : Effect of High-Energy Radiation on Mixtures of Vinyl or related Polymers with (B. J. Lyons), 604
Unskilled and Semi-Skilled Operatives in Manufacturing Industry · Training (W. D. Seymour), 509
Unstabilized Retinal Images : Monocular 'Rivalry' between Stabilized and (Dr. D. M. MacKay), 834
Upjohn Cell Model at the Royal Scottish Museum, 13
Upland Climate and Land Usage, with special reference to Highland Britain (Third Symposium on Aspects of Agricultural Meteorology), (University College, Aberystwyth), 737
Upper-Atmosphere Density . Variation of, with Latitude and Season—Further Evidence from Satellite Orbits (D. G. King-Hele and D M C. Walker), 727
Uptake of Streptomycin by *Escherichia coli* (Effect of Streptomycin on *Escherichia coli* (Nitya Anand, Dr. Bernard D. Davis and Alan K Armitage), 23
Uranium · Carbonates of (Balaram Sahoo and Dr D Patnaik), 683
  Separation of, by Reversed Phase-Partition Chromatography (A G. Hamlin and B J Roberts), 527
Uranium in South-West England, 213
Uranium Dioxide : Decomposition of, at its Melting Point (Dr. J S Anderson, J O. Sawyer, Prof H W. Worner, G M Willis and M. J. Bannister), 915
Urch, Dr D. S. : Appointed lecturer in chemistry at the University of Birmingham, 433
Urea Sprays (Post-Harvest) Nitrogen Feeding of Apple Trees by (Dr. K. Oland), 857
Uridine (Tritiated) · Incorporation of, into Amphibian Eggs (N. Bieliavsky and R. Tencer), 401
Urinary Hyaluronidase (G. M. Berlyne), 389
Urinary Œstrogens of the Dog (Dr John Kristoffersen and Weiert Velle), 253
Urinary Selenium and Dental Caries (P B. Cadell and F B Cousins), 863
Urine : Presence of Aldosterone-stimulating Hormone in (Dr. E J Ross, E. K. McLean and G. R. Miller), 540
Urine of Pregnant Women · Isolation of 17-*Epi*oestriol from the (Dr H. Breuer), 613
Urine of Schizophrenics : Biological Effects of Aromatic Extracts from (Dargut Kemali), 540
Urine (Normal Human) · Presence of Metanephrine and Normetanephrine in (Elwood H LaBrosse and Jay D. Mann), 40
Urine (Pregnant Ewes') : 17-Oxosteroids of (Dr W F Coulson), 612
Urine and Faeces : Collection of, from the Chicken (Dr. M. H Fussell), 332
Urinogenital System of the Common Dogfish · Abnormalities in the (Dr A. S Fuller and J. M. Zacharov), 50
d-Urobilin : Violinoid Products of Oxidation of (Prof C. H. Gray and D. C. Nicholson), 380
Urquhart, Dr. A. R. : Elected chairman of the Council of the Textile Institute, 14
Use of Chorionic Gonadotropin to prevent Early Embryonic Mortality in Temporarily Fasted Mice (T J McClure), 622
Use in Electrophoresis Simple Non-gassing Electrodes for (Rex Neihof and Sigmund Schuldiner), 526
Use of Isotopes Training in the, 13
Use of Light Alloys in Structural Engineering : Research Scholarship in the (Institution of Structural Engineers and the Aluminium Development Association), 356
Use of Toxic Chemicals in Agriculture and Food Storage (Appointment by the Minister of Agriculture, Fisheries and Food, with the Minister for Science, the Secretary of State for Scotland and the Minister of Health of a Research Study Group to consider the), 578
Use (Biological) . Hydrophilic Gels for (Prof. O. Wichterle and D. Lím), 117
Uses (Non-Medical) : Antibiotics, their Chemistry and (edited by Dr Herbert S Goldberg), *review* by Prof. Harold Raistrick, 797
Uspekhi Khimii · To be published in translation (*Russian Chemical Reviews*) by the Chemical Society, 891
U.S.S.R. · Nature Protection in, 580
U.S.S.R., Society for Cultural Relations with the : Lectures by Prof A. Masevich on the Conquest of Space, 286
Uteri of Pseudopregnant Mice · Implantation of Tissue Transplants in the (Ian B. Wilson), 553
Uyeda, N. (Suito, Prof E , and) Spiral Growth of Colloidal Gold and Moiré Fringe, 453

VACCINIA Virus in Serum-free and Serum-containing Cell Cultures · Multiplication of (Robert W. Pumper, Lawrence J. Alfred and David L Sackett), 123
Vacuum (Gas Discharge High-) Pump . Pumping Effect of a (Libor Páty), 674
Vaisey, Dr. Gillian : Appointed lecturer in the Department of Civil Engineering, University of Birmingham, 892
Valentine, Prof. D H At the meeting of the Flora Europaea Organization in Vienna (Taxonomy of Apomicts), 15 ; (Problems of Geographical Distribution and Taxonomy), 16
  At the Conference of the Botanical Society of the British Isles to celebrate the Centenary of the publication of the 'Origin of Species' (Evolution in *Primula* section Vernales), 217
Valentine, Prof. D H., and Woodell, Dr. S. R J. : Seed Incompatibility in *Primula*, 778
Valentine, Dr R. C (Hart, Dr. P. D'Arcy, and) : Elongation of a Leprosy Bacillus (*Mycobacterium lepraemurium*) in a Cell-free Medium, 58
Valleys · The Rhondda—a Study in Industrial Development, 1800 to the Present Day (E. D. Lewis), *review* by Prof L Dudley Stamp, 415
Value of Instruments and Automatic Control to the Smaller Firm (Society of Instrument Technology Conference on), 737
Van Buren, Prof. J P , and others : An Anthocyanin-decolorizing System in Sour Cherries, 165
van Moorsel, H. Palaeoliths at Leopoldville, 286
van Oordt, Dr P G. W. J. : Cyclical Activity in Endocrine Systems (Influence of Internal and External Factors in the Regulation of the Anuran Spermatogenetic Cycle), 663
Vannotti, Prof A (Cullity, B., and) · Porphyrin Biosynthesis in the Leucocyte, 187
Vapour (Phenanthrene) . Spectrum of Delayed Fluorescence in—a Criterion of Purity (Dr. B. Stevens, E. Hutton and Prof. G. Porter), 917
Vapours : Inhaled Particles and (British Occupational Hygiene Society International Symposium on), 14, 433
n Variables : Fitting Linear Relations to, all Liable to Error (M. H. Hey and E. N Hey), 338
Variants (Antifolic Resistant), of the Disease · Immunity of Mice surviving Systemic Leukaemia (*L*1210) to (Dr. Abraham Goldin, Stewart R Humphreys, Gerald O. Chapman, Dr. Michael A. Chirigos and John M. Venditti), 219
Variation · Microbial (edited by Prof. V. D. Timakov), translated from the Russian by G. H. Beale, *review* by Dr. E. F. Gale, 344

DISPOSAL OF RADIOACTIVE WASTE

THE problem of waste disposal is as old as life itself, and although it has raised difficulties in the past, there is no reason why the disposal of radioactive wastes should not be carried out in a completely satisfactory manner. Man's knowledge of the deleterious effects of radiation is by no means complete, but it is probably as extensive as his knowledge of any other single potential source of injury. Moreover, his attitude towards radiation is one of greater concern and caution than towards any other comparable danger. At the same time, almost all users of radioactive material recognize that they will damage the future of their industry, perhaps irreparably, if they adopt an irresponsible attitude towards the disposal of radioactive waste. In return, they have the right to expect a balanced appreciation and understanding of their problems by the community for which they work.

The importance of these problems was emphasized by the Conference on Radioactive Waste Disposal organized at Monaco in November by the International Atomic Energy Agency and the United Nations Educational, Scientific and Cultural Organization. This Conference, with about three hundred participants from more than thirty countries, dealt with the handling and treatment of radioactive waste as well as its disposal into the atmosphere, the sea and the land. The Conference programme gave special prominence to the marine problems, partly because the Conference was held in the Oceanographic Museum of Monaco, but mainly because there is at present a widespread international interest in the freedom of the seas and the utilization of marine resources.

The problems of waste disposal involve many scientific disciplines, and one of the principal aims of this Conference was to draw these disciplines together. In this it has succeeded to a considerable extent. However, too much time was spent in discussing the treatment and handling of waste prior to disposal, and there was no attempt to explain the technicalities of radioactivity to specialists in other fields, many of them clearly meeting these technicalities for the first time. There was also some repetition of information on the types and quantities of wastes from national atomic energy projects, and this repetition could have been avoided by the presentation of a single paper reviewing the problems from an international point of view. In spite of these weaknesses, considerable progress was made towards explaining the problems of the user or producer of radioactivity, and conversely the representatives of atomic energy projects now have a better understanding both of the natural fears of the biologist and ecologist and of the extent to which these and other specialists can help them in achieving the safe disposal of waste.

Technically, this was not a conference of disclosures, and probably most of the information presented was already known to specialists in the relevant fields. The progress which has been made has been in the field of defining principles and how they should be applied, and understandably this has not been achieved without differences of opinion, some of which have not yet been resolved. These differences did not appear during discussions on gaseous waste, nor in sessions dealing with disposal into geological formations. They were almost entirely confined to the problems of the marine environment. The two subjects which aroused the greatest interest were the discharges of low and intermediate activity wastes to the sea from Windscale, in Cumberland, and the technical and legal problems posed by the international nature of the sea. Although some of the questions contained critical implications, there was little direct criticism of the Windscale discharges, and a favourable impression was created by the reports of the considerable amount of work undertaken before and during the discharges. There was, however, a complete opposition of views on the legal question. It was the general view that present international law is not adequate to deal with radioactive waste, and that eventually it will be necessary to agree on an international convention. A strongly expressed minority view considered that all discharges of radioactivity to the sea are dangerous and that it would be wrong to discuss any proposals for legalizing them.

The British view at the Conference, supported by American oceanographers and biologists, was that the use of radioactive materials and nuclear power necessarily involves the releases of small amounts of radioactivity to man's environment. These releases cause some additional radiation exposure of man, and their significance can be judged by comparing this exposure with the recommendations of the International Commission on Radiological Protection. The exposures must be kept below the recommendations of that Commission regardless of the cost in human effort, and it is desirable to keep them as far below these recommendations as is practicable. In assessing whether a reduction is practicable, it is necessary to consider the level of exposure as a fraction of the Commission's recommendations and the reduction factor likely to be achieved, as well as the effort involved in achieving it. This view appears to be shared by the representatives of almost all the atomic energy projects. An alternative view which appeared to underlie some of the contributions, and which was expressed in more detail in personal discussions, holds that no expenditure of effort is too great if it reduces human exposure, and that, with sufficient effort, releases of radioactivity to man's environment can be reduced to zero. In its simplest form, this view was expressed as an outright condemnation of any discharges of radioactivity to the sea, or to other parts of man's environment. The weakness of the position adopted by the supporters of this view is in the absolute nature of their claim. Some quantities of radioactivity are demonstrably trivial in any environment, and a complete denial of this can have only one practicable meaning—that no use can be made of radioactive materials or nuclear power. Clearly the supporters of this absolute point of view are not anxious to achieve the banning of artificial radioactivity and nuclear power; their aim is presumably that of all the specialists in this field, namely, to deal with radioactive waste in ways which do not harm man or spoil his environment. By refusing to admit the possibility of agreeing either on scientifically based standards or on legal provisions controlling the disposal of waste at sea, they are actually reducing the chances of achieving this aim.

It would be wrong to under-estimate the importance of these differences of opinion, and we shall certainly hear more of them in future conferences on atomic energy and on such things as the law of the sea. On the other hand, they were by no means a dominant feature of the Monaco Conference, which should be remembered more for the opportunities it gave for exchanging views. There was complete agreement that nuclear power must not be allowed to impair man's use of the resources of the sea, either now or in the future, but as one prominent oceanographer remarked—the ability to receive wastes without damage *is* one of the resources of the sea. If an appropriate balance is to be obtained between the utilization of marine resources and the cost to mankind of nuclear power, the oceanographers and marine biologists must join the chemists and chemical engineers in quantitative studies aimed at providing governments with the scientific basis of a balanced decision.

BIOLOGICAL CONCEPTS BEFORE DARWIN

Forerunners of Darwin

1745–1859. Edited by Bentley Glass, Oswei Temkin and William L. Straus, Jr. Pp. viii+471. (Baltimore, Md.: The Johns Hopkins Press; London: Oxford University Press, 1959.) 52*s*. net.

WHEN a man has done many things he is more likely to have had numerous forerunners than if he had done nothing, and their number is no disparagement to his achievement, as can be seen in the case of Darwin. This is all the more so when the forerunners are selected from only a part of his fields of activity, represented by evolution by natural selection and omitting his work on coral reefs, volcanic islands, insectivorous plants, climbing plants, cross-fertilization, and methods of communication between animals by means of the expression of the emotions. The forerunners in the field of transmutation of species and the methods by which it has been brought about are by themselves quite sufficient to fill a splendid volume.

From a recently discovered letter addressed by Darwin to Baden Powell, the contribution which Darwin claimed as his own unaided achievement is now precisely known. It is to have discovered the explanation of "*how* species become modified, & to a certain extent how the theory of descent explains certain large classes of facts", in which respect he received no assistance from his predecessors. As more and more manuscripts come to light, and existing documents are studied more critically, the number of forerunners in any field increases. With the help of hindsight, as Prof. Loren C. Eiseley has shown, it is possible to read into some works certain ideas which, in fact, their authors did not consciously recognize. He has established a criterion which must be satisfied before a forerunner of Darwin can be accepted as a real precursor. There must be recognition of the similarity between artificial and natural selection, and the conception of unlimited organic change in vast periods of time. Played according to these rules, the exploration of biological concepts prior to Darwin is a fascinating game to which the book under review is a perfect guide. Its fifteen chapters are as many essays on various aspects of the theory by a number of recognized experts, and the fact that some points here and there will lead to disagreement on matters of detail only shows how stimulating and thought-provoking the book is.

GAVIN DE BEER

PEDOLOGY

Fundamentals of Soil Science

By Prof. C. E. Millar, L. M. Turk and Prof. H. D Foth. Third edition. Pp. x+526. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1958.) 62*s*. net.

Introduction to Soil Science

By Prof. G. W. Leeper. Third edition. Pp. viii+222+12 plates. (Carlton: Melbourne University Press; London: Cambridge University Press, 1957.) 30*s*. net.

The Study of the Soil in the Field

By G. R. Clarke. Fourth edition. Pp. 204+6 plates. (Oxford: Clarendon Press; London: Oxford University Press, 1957.) 35*s*. net.

ALTHOUGH pedology has now advanced to the point where it has become a coherent discipline worthy to be taught as a subject in its own right at university-level, it has for too long been regarded simply as a branch of husbandry, taught in agricultural faculties for agricultural ends. One result of this is the present lack of adequately trained pedologists; another is the virtual absence of good up-to-date text-books which develop the whole subject in a balanced and logical fashion. Unfortunately, neither of the two general text-books under review does anything to rectify this situation

"Fundamentals of Soil Science" in no way lives up to its title. It is a superficial descriptive text, adequate, perhaps, for potential farmers familiar with North American conditions but quite unsuitable as the university text-book which it claims to be, for two main reasons.

In the first place, it fails to take advantage of the results of modern work (for example, on the structures and colloid chemistry of the silicate minerals) to explain in fundamental terms the processes occurring in soils. Secondly, it glosses over all debatable points, making no attempt to discuss them, and the inquiring student will find no bibliography. The book, therefore, gives neither a sound training in pedology nor any encouragement to the student to use his powers of reasoning. Instead, it branches off into the realms of crop husbandry and a very long way from its own title. Further, the book is too long and too expensive for the material it contains, and the reader is irritated by the repetition of section headings in the form of little questions in the text. The inclusion of some good diagrams and photographs and a useful glossary unfortunately do not affect the criticisms given above.

"Introduction to Soil Science" is a far less ambitious book and is considerably shorter and cheaper. It is aimed at a similar audience but with Australian conditions especially in mind. The text is written in a clear, concise style and is readable and interesting. As the author himself points out, the arrangement of the chapters is not as logical as it might be—soil erosion, for example, is considered in the section on soil chemistry rather than with soil physics. Some suggestions for practical work are given in the appendix but, as with the material of the book as a whole, these experiments fall between the requirements of the serious university student and those of the schoolboy who may be interested in soils. There is a short bibliography, mainly applicable to Australian conditions.

"The Study of the Soil in the Field" is a very different proposition. This book, now in its fourth edition, represents the accumulated wisdom of one who has studied soils in the field for many years and who is something of a philosopher. It is primarily a lucid and concise text-book of field procedures and is virtually indispensable for anyone, be he student or practising pedologist, who wishes to study the soil in its natural context. The book is essentially written in the light of experience in Britain, but frequent comparisons are made with conditions elsewhere. A new addition is the chapter on the use of air photographs in soil surveys. It contains useful information on air photographs in general, but becomes rather vague in the section on actual interpretation for soil survey purposes. The photographs with accompanying traces are very interesting, but demonstrate the usefulness of air survey for geological and ecological rather than for pedological purposes.

R. M. S. Perrin

PRACTICAL INSECT MORPHOLOGY

Manual of Insect Morphology

By Prof. E. Melville DuPorte. Pp. xi+224. (New York: Reinhold Publishing Corporation; London: Chapman and Hall, Ltd., 1959.) 40*s*. net.

This volume is a publication of the typescript notes used by the author when he was teaching his laboratory class. It gives direct instructions for making nearly two hundred examinations and dissections, using insects that can easily be obtained in quantity. Naturally, North American insects are specified, but equivalent substitutes can be found in other regions. After familiarizing the student with the idea of segmentation, and with the basic construction of a segment, the manual gives ten chapters to external structures, and six to internal organs.

Instructions are explicit, and the language is commendably simple and direct. New terms are put in italics the first time that they are introduced, but in spite of this a student would fairly often come upon a word that is not defined in the text nor in the inadequate glossary on p. 6. He would have to remember such words as 'condyle' and 'invagination' from the lectures that he is presumably attending concurrently with his laboratory course.

So far as the text goes, this manual is excellent. It is clearly printed, helpfully divided into convenient sections, and uses a variety of type-faces to the best advantage. It deserves high praise for presenting so much information in such a readily accessible form.

The problem for the reviewer, and for the potential user, is to know what to say about the almost total lack of illustration. There are only fourteen figures, all schematic line-drawings of the simplest kind. We are told that they are intended as a guide to the structure, and that none of them is an exact reproduction of any known insect. In fact, they are the sort of diagram that a lecturer might rough out on the blackboard, talking and explaining all the while; without the lecturer to explain them they do not add much to the text. There are no drawings at all of what one may expect to see after making any of the dissections. "Students are advised to study the drawings in the text-book or other writings of Snodgrass, as well as the work of other competent entomological illustrators." One can sympathize with the author's problem. Two hundred anatomical drawings, fully lettered, would have cost a lot to make, and more to publish. The price of this book is already too high for what it is, and with such figures it would be prohibitive. Yet without any figures I do not see how it can be used by an unaided student. He has neither the time nor the experience needed to be able to apply a verbal description, however lucid, to an unskilled dissection.

The manual may be useful to some experienced entomologists—a demonstrator called upon to give a course in insect morphology, or a specialist in one group who wishes to study the anatomy of related groups.

H. Oldroyd

ULTRASONIC PROPAGATION

Absorption and Dispersion of Ultrasonic Waves

By Karl F. Herzfeld and Theodore A. Litovitz. (Pure and Applied Physics: a Series of Monographs and Text-books, Vol. 7.) Pp. xviii+535. (New York: Academic Press, Inc.; London: Academic Press, Inc. (London), Ltd, 1959.) 14.50 dollars.

Since the appearance of the paper of P. Debye on the effects of high-frequency relaxation in the propagation of electro-magnetic waves in substances, much research has been done in that field of study and many books and papers published. Less attention has been devoted to the corresponding relaxation effects in the propagation of compressional waves, though the discovery by G. W. Pierce in 1925 of a dispersion in the velocity of high-frequency sound waves in carbon dioxide gas marked the beginning of new studies which have occupied a considerable number of research workers in physics and physical chemistry since.

It is opportune that we should now have a general survey of acoustical relaxation effects; and the authors of this volume, by their researches on both the theoretical and experimental aspects, are well equipped to make it. The plan of the book is succinctly set forth in the introduction. The evidence for relaxation, shown by a frequency-dependent specific heat and consequent excess absorption, is examined in the light of various theories, in particular those based on the idea of a bulk viscosity. From single relaxation times we pass to multiple ones and to interactions between different types of molecules in mixtures.

The weakness of all theories in this field has been that, though the existence of relaxations had been experimentally proved, the relaxation times themselves could not be deduced *a priori*, but in Chapter 7 the probability of energy transfer during the passage of the sound wave is discussed, and calculations made of the ratio of the relaxation time to the mean free time between collisions for a diatomic gas, and hence of the relaxation time itself as a function of temperature.

Later the experimental results for liquids are presented. The relevant theory is much more difficult, and at present one can only discuss the results phenomenologically.

The book is an excellent and detailed account of the present state of ultrasonic propagation in fluids and should be read by all who work in this field or wish to examine the latest theories of relaxation in fluids. There is no discussion of ultrasonic propagation in solids and, in this respect, the title is too general; although, as the authors point out, there exist books which cover the omission.

E. G. RICHARDSON

NUCLEAR POWER TECHNOLOGY

Nuclear Engineering Handbook

Edited by Harold Etherington. (McGraw-Hill Handbooks.) Pp. xv + 1866. (London: McGraw-Hill Publishing Company, Ltd., 1958.) 194*s*.

Nuclear Power Plant

By E. Openshaw Taylor. Pp. vii+184. (London: George Newnes, Ltd., 1959.) 30*s*. net.

Chemistry of Nuclear Power

By Dr. J. K. Dawson and Dr. G. Long. Pp. vi+208+8 plates. (London: George Newnes, Ltd., 1959.) 30*s*. net.

Physics and Heat Technology of Reactors

Translated from the Russian. (Supplement No. 1 of the Soviet Journal of Atomic Energy, *Atomnaia Energiia*.) Pp. v+174. (New York: Consultants Bureau, Inc.; London: Chapman and Hall, Ltd., 1958.) 22.50 dollars; 168*s*. net.

THE "Nuclear Engineering Handbook" is an attempt to collect into one volume theory, formulæ and data from the many different branches of science and engineering which have contributed to the development of nuclear fission reactors. The contents include sections on mathematics, nuclear and reactor physics, isotope technology, radiological protection, heat transfer, materials, chemistry and chemical engineering, and mechanical design. The editors have realized how important it is that a handbook should be easy to use and have provided, in addition to an index, an extensive guide.

The handbook contains an immense amount of information, extremely well organized. The kind of information given and the aim in giving it varies considerably from section to section. In the sections on mathematics the reader will find a neat review of algebra, geometry and analysis, starting from the basic arithmetical operations and including the theory of equations, vector analysis, probability, differential and integral equations, integral transforms, the calculus of variations, etc. In spite of its clarity, however, this section is not likely to satisfy either mathematicians or others seeking mathematical assistance in solving practical problems.

In the numerous sections dealing with what might be termed the nucleonics of reactors, a comprehensive treatment is given, starting with nuclear physics and leading to a comparison of reactor design formulæ with experimental results.

In the sections on fluid flow, heat transfer and materials, emphasis is placed on the application of information. The fundamentals of fluid flow are sketchily treated, but a large amount of useful data is included in the form of tables, graphs and equations. The designer is also catered for in a section which includes general and detailed drawings of several reactors and components.

In a book of this kind it is not easy to strike a balance between data and text. I would prefer greater emphasis on the former. In spite of these minor criticisms, the book is invaluable to anyone who needs to be constantly in touch with several of the diverse subjects involved in nuclear engineering.

"Nuclear Power Plant" contains an elementary treatment of the principles and problems of nuclear power plant design. The author has assumed that the reader's scientific standard is that of the sixth-form science courses in schools in Britain, and except in relatively unimportant respects he has successfully kept the requirements to this standard. The arrangement is logical, starting with a review of energy requirements and resources, continuing with the scientific and engineering aspects and concluding with a chapter on the economics of nuclear power stations. The important topics both in science and engineering have been well selected, and, although it is inevitable that simplifications are made in a book of this length, they are, in the present case, few and unimportant.

"Chemistry of Nuclear Power" describes the many important roles which chemistry takes in nuclear power technology. Although not written specially for chemists, an elementary knowledge of chemistry is essential to understand some sections. The part which chemistry plays in refining raw materials, in fuel preparation and re-processing, in reactor technology and in disposing of radioactive wastes is clearly indicated, as is the complicated relationship between chemistry and metallurgy. This book should go far to convince a sixth-form or first-year university student that the career of the chemist in nuclear technology is as interesting and important as that of the physicist.

"Physics and Heat Technology of Reactors" contains English translations of nineteen original papers by Soviet authors. The papers on reactor theory will be of special interest to Western readers because of the originality of the Soviet scientist in this field. Those dealing with heat technology are disappointing when seen in relation to the great amount of high-quality research in this subject which Soviet technologists have carried out.

W. MURGATROYD

PROFESSIONAL ENGINEERS IN BRITAIN

THAT engineering can be practised as a profession has been recognized in Great Britain for well over a century. The registration of professional engineers, a practice which has become established in a good many other parts of the world, has not found favour in Great Britain, and the standards of the profession have been built up and are maintained by the professional engineering institutions, notably the Institutions of Civil Engineers, of Mechanical Engineers and of Electrical Engineers.

There has been since the Second World War in all the engineering institutions a good deal of reviewing of academic standards, of requirements for practical training, and indeed in quite a fundamental sense of the meaning to be ascribed to the term 'professional engineer'. It is not therefore surprising that Sir Willis Jackson should choose as the theme of his presidential address to the Institution of Electrical Engineers, delivered on October 9, "The Making of Professional Engineers".

Education, training and the social and economic setting in which engineers pursue their vocation come under review in a balanced assessment and penetrating analysis of what might be termed the production and utilization of professional engineers in Great Britain. That the sustained effort which has been made in recent years to attract an increased proportion of the more able young people to take up careers in science or technology is beginning to bear fruit is clearly evidenced by data given in the address. The numbers of schoolboys and schoolgirls passing the Advanced Level General Certificate of Education examination in the subjects of physics, chemistry and mathematics increased between 1953 and 1958 by some 59 per cent, 43 per cent, and 65 per cent, respectively, the corresponding increase in school population over fifteen years of age in the period being some 26 per cent. While radio, television, the national Press and official publications have all shared in this effort, there is no doubt that a major contribution has been made by industry by fostering a closer contact between schoolmasters and the staff of industrial organizations. In addition, the teaching of experimental science in the independent schools has been stimulated and greatly assisted by the Industrial Fund for the Advancement of Scientific Education which was established in 1955.

Gratifying as this increase in numbers is, there is, on the other hand, little cause for satisfaction as to progress in the attempt to broaden the sixth-form school curriculum. The comment is made that a factor which militates against any broadening of the curriculum is the high standard of specialist knowledge required by the universities for entry to undergraduate courses. While this is in large measure true, it must be realized that there are in fact two related factors. The first is the admittedly high standard of knowledge required and the second is the extreme pressure of applications for the available places in the universities. University places are highly competitive and the better the pass the better the chance of acceptance. It may well be that sixth-form work in schools is bedevilled more by the need to limit objectives, in the hope of achieving a high place in the examination, than by the intrinsic requirements of the examination syllabuses themselves.

Another development in schools which Sir Willis notes with disapprobation is the introduction of engineering subjects into the sixth-form curriculum. These, he suggests, are possibly introduced with the aim of stimulating interest in engineering as a career and providing an incentive to serious study. It would, however, be through a misconception of the educational needs of the professional engineer, if grammar schools were to encourage boys with little aptitude for mathematics and the basic sciences to continue at school up to the age of eighteen to study technical subjects. "The profession of engineering is," he asserts, "no haven for the scientific weakling." That is a dictum which cannot be too often reiterated to every schoolmaster.

Science teaching in schools is, however, determined by the availability of suitably qualified teachers, and the continuing shortage of teachers of science dominates all other considerations relating to the development of pure and applied science. Sir Willis Jackson states the facts with a simplicity which signalizes the urgency of the situation. In 1965 the school population of seventeen-year-olds will reach its peak of twice the 1959 numbers. In 1958, there were, in maintained secondary schools, some 8,900 teachers of mathematics, physics or chemistry, but more than 800 posts in these subjects were either vacant or unsatisfactorily filled. While there is a small but definite improvement in the rate of recruitment to school teaching among science graduates, this will be completely outstripped by the rate of increase of the corresponding school population, altogether apart from the leeway which still requires to be made up. Allowing that there is considerable reserve of capacity resulting from the small numbers in many sixth-form classes, it is none the less evident that the shortage must become acute. Referring to this problem, Sir Willis comments that salary is by no means the only consideration that affects the willingness of science graduates to enter the teaching profession. Teaching facilities, amenities and general conditions of employment are also important factors. It is worth while in this connexion to note that the shortage of teachers in technical colleges is less acute than in schools. Salary scales are rather better, but equally or even more importantly, the technical college teacher has greater freedom from incidental duties, has first-class laboratory facilities and he is encouraged to pursue research. In individual instances pupils have transferred from schools having inadequate science teaching to neighbouring technical colleges where fully satisfactory facilities have been available. While such transfers of pupils on any substantial scale would subvert for the time being the policy of building up the sixth-form science teaching in schools, their utilization as a temporary emergency measure should not be overlooked.

The number of undergraduate students of science and technology in the universities of Great Britain has increased by a factor of nearly three since 1938–39 and now constitutes about 38 per cent of the total university student population of almost 100,000. For the most part these students pursue courses of three years duration. Of these undergraduates, about 40 per cent study engineering or some branch of applied science; but it must be remembered that an appreciable proportion of graduates in pure science, particularly in physics and chemistry, become technologists. The Institution of Electrical Engineers accepts into its membership an increasing number of such physicists.

Sir Willis Jackson takes note of the pressure to increase the length of the undergraduate course, a pressure resulting from the remarkable expansion of the field of knowledge and from recognition of the undesirable degree of specialization existing both in school and undergraduate courses. He does not, however, concede the point that if an extension were practicable it would necessarily be desirable to make it. He considers that for the majority of students of technology three years in the university constitutes a long enough preparation for active participation in the affairs of life outside. In his opinion it is of greater importance to examine afresh the objectives and content of university courses in technology in the light of the new situation, in which a substantial contribution to the teaching of technology at university-level is being made by the colleges of advanced technology. This is indeed a matter of first importance. The universities and the colleges of advanced technology are partners in the education of that section of the youth of Great Britain destined to become the professional engineers and applied scientists.

The new diploma in technology has been conceived and developed with the underlying assumption that there is an approach to the study of applied science which has more emphasis on application than is appropriate to universities, but which can still constitute an academic discipline of university rank. It is believed that by virtue of the integration of studies with industrial experience, the student will be better able to appreciate aspects of technology and to approach, with greater understanding, subjects related to the organization of industry. This is the factor which gives its distinctive quality to the diploma in technology. The validity of this assumption is being put to the proof in courses which are now running in the eight colleges of advanced technology and in the regional colleges which have so far been established. There is encouraging evidence that these courses are justifying the hopes of their designers. At the same time, it is clear that a conscious and sustained effort will be required to ensure that courses for the diploma in technology and courses in universities supplement one another and that, by fostering and emphasizing their distinctive qualities, the two combine to augment the national total of applied scientists. Sir Willis implies that both the universities and the colleges of technology should give serious thought to identifying what are to be the essential distinctive qualities of their courses so that the danger may be avoided of both types of institution offering courses which academically are scarcely distinguishable.

Postgraduate study and research are subjects also very relevant to the making of professional engineers. Research in one form or another is the vital force of academic life, whether the academy be a university or a college of technology. The spirit of inquiry which should characterize the outlook and inspire the teaching of the staffs of universities and colleges requires for its nurture not only a favourable intellectual climate but also the physical resources for its growth. The pattern of the research schools in the universities is essentially in the classical tradition in the sense that the master gathers about him a group of the most able young scholars who, on one hand, draw inspiration from the master and on the other furnish him with the stimulus of their fresh intellects and the challenge of their problems. Research in the physical sciences requires facilities and services of increasing magnitude and complexity, and when the sciences are applied sciences, the situation becomes vastly more complicated by the interrelation between practice and science. Here unquestionably the stimulus of achievement in application can match and even surpass that of intellectual curiosity.

It is, in the opinion of Sir Willis Jackson, quite unrealistic to suppose that the teaching of technology at its highest level can be carried out wholly or largely by men who occupy full-time teaching posts, unless these men return to industry or a similar environment at appropriate intervals. He commends the practice, long established in other countries, by which, for limited periods, carefully selected experts from industry or government establishments are given academic status and contribute to the advanced specialist teaching of technology. Drawing a parallel with the position of medical clinicians, who carry full academic standing in the universities, he goes on to suggest that the separation of establishments of the Department of Scientific and Industrial Research from the domain of technological teaching constitutes a serious national handicap. It would, he considers, be a useful first step if these research establishments and some of the research associations could be accepted as recognized institutions of universities in the sense that selected members of their staffs could be fully recognized as teaching members of appropriate faculties.

That the highest level of knowledge of the specialized applications of science to technology resides in industrial and government research establishments and design departments is undeniable. It is, however, equally true that there is a network of informal association between the staffs of universities and colleges, and those of industrial organizations and government establishments. The extent and importance of this must not be under-estimated. Exchange of information, participation in seminars, membership of research committees and the provision of specialist lecturers—all these feature in an informal and cordial co-operation from which the greatest benefit is derived. It is a widening of this association and its organization on a more formal basis which Sir Willis Jackson advocates. The practice in the technical universities of the Continent of Europe of appointing as professors distinguished engineers and scientists in industry who then divide their time and attention between their academic and their industrial responsibilities possesses the great merit of bringing current industrial problems directly to the notice of students. The Continental system, however, has its drawbacks. Faculties are much less closely knit than in Great Britain, and co-ordination of teaching is, by comparison, relatively slight. Not infrequently academic visitors from the Continent remark with appreciation upon the unity and coherence not only of faculties but also of complete universities in Great Britain. If a university department were to lean unduly upon the support of a group of experts from outside, it would be in danger of weakening that intellectual integrity and coherence which are its priceless possessions. Undoubtedly the strengthening of the link between technological teaching and industry is of major importance. The success of whatever methods are adopted to that end will be gauged by the growing intrinsic strength of university and college departments

It is only relatively recently that universities and colleges have made regular and systematic provision for postgraduate study. Sir Willis stresses that the need for postgraduate courses will grow, and that participation in providing them must be recognized and accepted as an increasing necessity. Referring to postgraduate study in university departments of engineering, he subscribes to the view that a period of industrial training is an essential pre-requisite to the choice of a field of advanced work and to effective study in it. That industry has made only a very limited response to the offers of courses of postgraduate study which have so far been made by universities is, in Sir Willis's opinion, due in part to the shortage of graduates at a time of expanding industrial activity and in part to a measure of inflexibility in universities themselves. Courses of shorter duration than a full university session would, he believes, have been more attractive.

Sir Willis does not, however, refer to a feature of postgraduate study which is of considerable significance, namely, that there are in fact two fairly well differentiated types of postgraduate course which might be described as specialist and fundamental. The specialist course deals with a branch of technology in which advanced methods of analysis and design have been formulated, the significance of which will be best appreciated by someone already familiar with the practice of the subject. The fundamental course, on the other hand, simply represents an extension of the undergraduate course. The potential research engineer who has completed the normal undergraduate course in engineering starts his industrial career with a severe handicap in that he possesses only the most superficial knowledge of modern physics. In all probability he also has but little familiarity with the methods now available for tackling intractable problems with the aid of computers. These are examples of fundamental matters, an appreciation of which is not critically dependent upon industrial experience; equally importantly, they constitute rigorous studies to which the mind is unlikely ever to be better attuned than at the end of the undergraduate course. There are cogent arguments in favour of accepting for such fundamental courses, immediately after graduation, those honours graduates who show real aptitude for theoretical studies.

In the provision of postgraduate courses on a part-time basis, the major technical colleges of Great Britain have a noteworthy record. The new colleges of advanced technology are building up rapidly their activities in the postgraduate field, and their close association with industry places them in a very advantageous position for doing so. Research projects undertaken with the view of qualifying for the new higher award of the National Council for Technological Awards will normally be carried out mainly in industry but in close association with the teachers of one of the colleges of advanced technology. It is a happy augury for the future co-operation of universities and colleges of advanced technology that the postgraduate award of the National Council, the membership of the College of Technologists, will be available to suitably qualified university graduates and, equally, the universities will accept suitable holders of the diploma in technology as postgraduate students pursuing courses of postgraduate study or research leading to higher degrees. There is here an opportunity for forming a most fruitful association between the two types of institution. Just as at the undergraduate-level there will be a broad overlap in the courses themselves and in the qualities and the abilities of the men who pursue them, so in the postgraduate field will there be many courses of study and many research projects which could be pursued equally well in either type of institution. None the less, if the theory of the diploma in technology is well founded, there will be a general bias towards more applied problems in the colleges of technology and towards more fundamental problems in the universities. Common seminars, joint discussions and the occasional sharing of experimental facilities, will disclose a great community of interest and serve to engender that mutual respect which is the basis of true friendship.

The professional engineer requires practical training in addition to his academic qualifications, and Sir Willis Jackson devotes a good deal of attention to this subject. The fact is that the practical training facilities of Britain are already inadequate in scale, and Sir Willis describes the shortage of these facilities as the Achilles heel of our national plans for the further development of technical and technological education. The large manufacturing organizations have well-developed schemes of graduate apprenticeship, but the number of young graduates requiring training is already in excess of the number which these companies can handle satisfactorily. Sir Willis advocates the more active development of group training schemes in which smaller and more specialized firms co-operate in a scheme in which their limited individual resources are combined to provide a balanced training.

Difficulty in obtaining satisfactory practical training is a matter which affects very directly the Dip.Tech.(Eng.), for the qualification certifies not only that its possessor has attained the requisite academic standard but also that he has satisfactorily completed the required period of practical training. The problem of ensuring that this training has been satisfactorily carried out and that a proper balance has been maintained among its constituent parts is not easy of solution. It does, however, demand the closest attention, for a reliable method of assessment of practical training will ensure for the diploma in technology, in its training aspect, the standing and recognition which it merits.

Dealing with the utilization of our scientific man-power, Sir Willis considers that the efficient use of professional engineers and scientists is severely handicapped by failure to tackle effectively the education and training of the craftsmen and technicians by whom they should be supported. In addition to that, there is, he believes, much duplication of effort in research and design departments within the large organizations and between manufacturing industry and the research associations. This dissipation of effort reduces the resources which could be mobilized to launch a powerful attack on a new field.

Shortage of university places and limitations in the availability of practical training facilities may at first sight appear a fairly domestic matter. The fact is, however, that these limitations react very seriously on our ability to provide education and training for potential engineers and scientists from the Commonwealth and particularly from the under-developed countries. As a contribution to international co-operation and as a tangible expression of good will, a substantial increase in our education and training facilities, provided specifically for overseas students of technology, would do much to strengthen our national self-respect and would redound in more senses than one to our credit.

SCIENTIFIC CENTENARIES IN 1960

By JOAN M. EYLES

THE contributions to science made by royal persons lie more in the realm of patronage than in the performance of scientific work. One recalls the association of Charles II with the Royal Society, Louis XIV with the Royal Academy of Sciences in Paris and Frederick I with the Berlin Academy. Nevertheless, there have been some notable exceptions. The two Medici brothers, Grand Duke Ferdinand II and Leopold, were deeply interested in science, had a laboratory, and were responsible for the formation of the Academia del Cimento. Both Prince Rupert, cousin of Charles II, and Philip, Duke of Orleans, brother of Louis XIV, devoted much of their time to scientific study; while in Scotland James IV took part in alchemical operations.

This year, in Lisbon, an International Congress of the History of Discoveries, to be held under the auspices of the Portuguese Government, will commemorate the five hundredth anniversary of the death of another royal scientist, Prince Henry the Navigator. Prince Henry, the third surviving son of King John I of Portugal, was half English, for his mother was a daughter of John of Gaunt, the fourth son of Edward III. Prince Henry devoted his life to organizing voyages of exploration, both along the west coast of Africa and to the different groups of islands in the Atlantic. He resided for more than twenty years at Sagres, close to Cape St. Vincent, whence he could look out over the Atlantic. Here he briefed his captains and studied their reports. He employed skilled mathematicians and astronomers to instruct his navigators and to prepare charts, so that under his supervision Sagres became a centre of geographical research. The proceedings of the Congress should throw new light on this important era of discovery and colonization.

Another outstanding man with a gift for organization, this time an English physician, was Thomas Linacre (1460–1524). His name will always be associated with the foundation, in 1518, of the College of Physicians of London, of which he was the first president, meetings being held at his house. He also endowed three lectureships in medicine, two at Oxford and one at Cambridge. Linacre, who was physician to Henry VIII, and to many other great men of the time, had studied medicine at Padua. His only medical writings were translations of a number of works by Galen; but he was also the author of a Latin syntax and two elementary grammars, and he had a high reputation as a Greek and Latin scholar.

The sixteenth century saw the beginnings of British attempts at colonization of the North American coast. In 1585 a large party was sent by Sir Walter Raleigh to form the first colony. With them went Thomas Hariot, the man of science chosen by Raleigh to make a survey of the new land, and to report on the mineral resources, as well as plant and animal life. Hariot, born in 1560, and already distinguished as a mathematician, made a report, published in 1588, entitled "A Briefe and True Report of the New Found Land of Virginia", which is now a very rare book. Afterwards, he resumed the study of mathematics, and made important contributions to the theory of equations; and he was the first to use the two signs of inequality. His book on algebra, "Artis Analyticae Praxis", was not published until 1631, ten years after his death.

Contemporary with Hariot was the Swiss botanist Caspar (or Gaspard) Bauhin, born at Basle in 1560 His principal work, "Pinax Theatri Botanici", in which he described some six thousand species, appeared in 1623, a year before his death. Bauhin did invaluable work in disentangling the many botanical synonyms in use at that time and also made one of the first attempts at systematic classification. He abandoned the method of describing plants in alphabetical order of name, and used instead a binomial nomenclature, in which he anticipated Linnaeus.

This year is the tercentenary of the death of the mathematician who invented the slide rule, and also introduced those familiar signs, × for multiplication and : : for ratio. This was William Oughtred, born at Eton, where his father was a master in the College. He was elected to a fellowship in King's College, Cambridge, at the age of twenty. He was devoted to mathematical studies, and the time spent on them, he said, "I redeemed night by night from my natural sleep, defrauding my body, and inuring it to watching, cold and labour, while others took their rest". Most of his life was spent as rector of Albury, in Surrey, where many students of mathematics, including Seth Ward, Wallis and Wren, visited him for instruction and discussion. Oughtred was the author of a highly esteemed text-book of arithmetic and algebra, "Clavis Mathematicae", which went into a number of editions, and was later translated into English with a preface by Halley.

Two men, both of whom became professors of medicine at the newly founded University of Halle, and who shared an interest in chemistry, were born in 1660. The senior of the two was Friedrich Hoffmann, who gave his name to Hoffmann's anodyne and carried out much analytical work on mineral waters. He visited England, and was elected a Fellow of the Royal Society in 1720. He had as assistant Georg Ernst Stahl, whose name will always be linked with the phlogiston theory. These two supported opposing schools of philosophy, Hoffmann being a mechanist, and Stahl a vitalist. This led to strained relations between them, and in consequence Stahl resigned his professorship, and became Court physician in Berlin, where he died in 1734. Hoffmann died six years later.

Another physician whose interests were not restricted to medicine was Sir Hans Sloane (1660–1753), president of the Royal Society during 1727–41, whose collection of books, manuscripts and natural history specimens, together with the Harley and Cotton collections, formed the foundation of the British Museum. Sloane lived to be nearly ninety-three, and it is only seven years since the bicentenary of his death was commemorated.

The British Museum was first opened to the public in 1759, but seventy-six years earlier there was opened in Oxford, a museum, the Ashmolean, which contained not only collections open to public view, but also a laboratory and school of natural history. The first keeper of this Museum was Robert Plot, author of the "Natural History of Oxfordshire". The second was his assistant Edward Lhuyd, the tercentenary of whose birth also falls this year. Lhuyd was a Welshman whose interests included philology and archæology, as well as botany and geology. He made a considerable collection of fossils, and prepared an illustrated catalogue of them, which was published in 1699. It was the first systematic catalogue of British fossils. The University had refused to publish it; but ten subscribers, including Hans Sloane and Isaac Newton, put up the money for its publication, and it appeared in a small edition of 120 copies. Lhuyd died at the early age of forty-nine, the victim of a chill caught, it is said, through sleeping in a damp room at the Museum

Among the scientists who died in 1760 four call for particular notice—an astronomer, an anatomist, a botanist and a chemist. The astronomer, Louis Godin, was one of a party sent in 1735 by the Royal Academy of Sciences in Paris to measure the length of a degree near the equator. After some years in Peru, Godin, having completed his mathematical work with the expedition, accepted a post as cosmographer at the University in Lima He died at Cadiz in 1760, aged fifty-six.

The anatomist, J. B. Winslow, was born in Denmark in 1669, but became a naturalized Frenchman, and was also a member of the Royal Academy of Sciences in Paris. His lectures at the Jardin du Roi attracted large audiences, and his text-book of anatomy was in use for a century. He died in France at the age of ninety-one.

The sexual system of plant classification advanced by Linnaeus was not accepted at the time by all botanists, and one of its most persistent opponents was Charles Alston, professor of botany and materia medica at Edinburgh from 1710 until his death in 1760. Alston had studied at Leyden under Boerhaave, and his opinion carried sufficient weight to prevent any general acceptance of the Linnaean system in Scotland until after his death.

In Germany, J. T. Eller (1689–1760), physician to Frederick the Great, was one of the many eighteenth-century medical men who devoted much of their time to the study of chemistry. He carried out work on the solubilities of salts, and issued many papers in the publications of the Berlin Academy. Eller was also an influential supporter of Stahl's phlogiston theory.

Stahl's theory was soon to be opposed by the revolutionary ideas of Lavoisier, and two chemists born in 1760 became teachers of the new chemistry in their own countries. Thomas Beddoes, born in Shropshire, is remembered to-day more for his discovery of the young chemist Humphry Davy, whom he installed as superintendent of his Pneumatic Institute in Bristol, than for his chemical work. He was, however, a skilled chemist, and was reader in chemistry at Oxford during 1788–92. Attention has recently been directed to the efforts he made, while occupying this post, to improve the scientific side of the Bodleian Library (Robinson, E., *Annals of Science*, 11, 137; 1955). Beddoes had attended Black's lectures in Edinburgh, and had met Lavoisier in Paris. His own lectures appear to have been very popular, for he wrote to Black in 1788 that he had "the largest class in chemistry that has ever been seen at Oxford within the memory of man, in any department of knowledge". Three years later he wrote to congratulate Black on his renunciation of the "old Chemical Theory", from which it seems clear that Beddoes himself had already accepted the teachings of Lavoisier.

The first Swedish text-book to support Lavoisier's theories was written by Johan Gadolin, who was born at Åbo, in Finland, on June 5, 1760. Gadolin's early work was concerned with specific heat, but later he devoted himself to chemistry. He studied at Uppsala, and travelled widely in northern Europe. In 1794 he investigated an unusual mineral that had been found some years before at Ytterby, near Stockholm, and separated from it the first of the rare earths, later named yttria. Afterwards the mineral in which it was found was named gadolinite, by Klaproth. In 1797 Gadolin was appointed professor of chemistry at the University of Åbo, a post which he held for twenty-five years. He died in 1852, at the age of ninety-two.

Passing on to those who died only a century ago, we note first the brilliant young Hungarian soldier and mathematician, Janos Bolyai (born 1802). One of the first to challenge the authority of Euclid, he constructed a non-Euclidean geometry, which was published as an appendix to a text-book of geometry by his father, also a mathematician, in 1832. Lack of recognition, and the translation into German of a similar work by Lobachevsky, which had appeared in Russian in 1829–30, disappointed Bolyai, whom Gauss described as a "genius of the first rank", and he published no other mathematical work.

Another professional soldier who also made a name in science was General Sir Thomas Makdougall Brisbane, governor of New South Wales during 1822–26. He established an observatory at Paramatta in 1822, and the Brisbane catalogue of stars published in 1835 was the result of observations made there. Succeeding Sir Walter Scott as president of the Royal Society of Edinburgh in 1833, he occupied the chair until his death in 1860. He was also president of the British Association at its fourth meeting, in Edinburgh, in 1835. Important magnetic observations were made at his observatory at Makerstoun in Scotland, gaining for him the

Keith Prize of the Royal Society of Edinburgh in 1848.

A valuable step towards the theory of evolution was made when M. H. Rathke (born 1793), a native of Danzig, discovered the fish-like gill-slits and their blood vessels in the embryos of birds and mammals. Rathke's extensive writings include many embryological studies, the first detailed anatomical description of *Amphioxus* and accounts of many other marine animals. He succeeded the pioneer embryologist Von Baer at Konigsberg, where he remained until his death in 1860. He was elected a foreign member of the Royal Society in 1855.

Anthropology as a science can be said to have been established by J. F. Blumenbach of Gottingen, and his measurements of skulls entitle him to be regarded as the founder of craniology. It was not, however, until the Swedish biologist Adolf Anders Retzius (1796–1860) invented the cephalic index and used it as a basis for classification that craniology achieved a modern aspect. Retzius was born at Lund, and was one of three generations of distinguished natural scientists. He carried out biological research in many fields, and pioneered the study of comparative anatomy in Sweden.

The centenary of the birth of three well-known physiologists, two British and one Dutch, falls in May 1960. William Einthoven, born in Java, was professor of physiology in the University of Leyden for nearly forty-two years. He had a gift for solving physiological problems by physical methods, and in 1913 he invented the string galvanometer, and applied it to investigating the electric phenomena of the heart-beat. This led to the development of the electrocardiograph. In 1924, three years before his death, he received the Nobel Prize for Medicine. In 1926 he was elected a foreign member of the Royal Society.

Both the British physiologists, W. M. Bayliss and J. S. Haldane, did valuable work during the First World War, Bayliss in the treatment of wound shock, and Haldane, who had studied the respiratory processes under widely varying conditions, in the treatment of gassed patients. Haldane, who became director of the Mining Research Laboratory, was always particularly interested in problems affecting the health of miners. He received the Copley Medal of the Royal Society in 1934, two years before his death. Bayliss, well known as the author of "Principles of General Physiology", made an important contribution to science when, in 1902, with Starling, he announced the discovery of secretin, the first of the hormones to be discovered. He was elected a Fellow of the Royal Society in 1903, received the Copley Medal in 1919, and died in 1924.

Another Nobel prize winner in medicine was N. R. Finsen, the Danish physician, who was born in the Faeroes in 1860. He discovered the curative effects of ultra-violet light, and was the first to use sunlight baths in the treatment of tuberculosis. He died a year after the award was made, when only forty-four.

Turning to chemistry, yet another recipient of a Nobel award was the German chemist Eduard Buchner, who died near Verdun, on the Western Front, during the First World War. In 1897 he expressed enzymes from yeast cells and showed that alcoholic fermentation was caused by chemical agents, and not by physiological processes in yeast cells, as was previously believed. He was awarded the Nobel prize for chemistry in 1907.

An English chemist born in 1860 who cannot be overlooked is W. H. Perkin, junior, brilliant son of a brilliant father, who was professor of chemistry first in the Heriot-Watt College in Edinburgh, thence moving to Manchester, and finally becoming Waynflete professor of chemistry at Oxford in 1913. Here he remained until his death in 1929. Perkin carried out many important organic syntheses, and did much to advance the study of chemistry at Oxford.

To attain outstanding distinction both as a scientist and as a classicist is unusual, but it is one of the claims to fame of Sir D'Arcy Wentworth Thompson, for he was a Darwin medallist of the Royal Society and also served as president of the Classical Association (similarly Sir Archibald Geikie, the geologist, served as president of the Classical Association, and Sir Cyril Hinshelwood is now president both of the Royal Society and of the Classical Association). D'Arcy Thompson owed his deep knowledge of the classics to his father, professor of Greek in Queen's College, Galway. He studied medicine at Edinburgh, his birth-place, and biology at Cambridge, where he took both parts of the Natural Science Tripos with first-class honours. When only twenty-four, he was appointed professor of biology in the newly founded University College of Dundee; and there, and at St. Andrews, he remained actively at work until his death in 1948. Although his most outstanding work is his book "On Growth and Form", his volume of essays entitled "Science and the Classics" is more representative of his wide range of interests.

There must be many old students of D'Arcy Thompson who remember him with affection and gratitude, for he loved teaching, and the same can be said of the geologist W. W. Watts (1860–1947), who became professor of geology in the Imperial College of Science and Technology (then the Royal College of Science) in 1906, and over a period of twenty-four years built up the present well-known school of geology. Although his devotion to teaching left him little time for research, he carried out valuable field-work in Shropshire and in Charnwood Forest. "Geology for Beginners", the little book he first published in 1898, is still in print, and has probably been used by more elementary students of geology than any other work. Watts was president of the British Association in 1935, and in 1945, at the age of eighty-five, he delivered the first William Smith Lecture to the Geological Society of London.

Another worker in the field of geology and geography was Sir Sidney Burrard, who joined the Survey of India in 1884, and in 1901 published a paper on "The Attraction of the Himalayan Mountains on the Plumb Line in India", which threw new light on the distribution of gravity anomalies. Burrard was surveyor-general of India during 1911–19 In 1913 he received the Victoria Medal of the Royal Geographical Society for his work in India.

Other scientists born in 1860 include E. A. Sperry, American inventor of the gyro-compass; D. E. Smith, historian of mathematics and founder in 1924 of the History of Science Society in Boston; W. B. Spencer, the anthropologist; and J. G. Bartholomew, the Scottish cartographer and one of the founders of the Royal Scottish Geographical Society.

No reminder should be needed that 1960 is the tercentenary of the first formal meeting, on November 28, 1660, of the Royal Society, although the Royal Charter was not obtained until 1662.

OBSERVATIONS RELATED TO THE IMPACT OF *LUNIK II*

By G. FIELDER

Director, Lunar Section, British Astronomical Association

THE accompanying table gives particulars of observations which may be related to the impact of *Lunik II* with the Moon.

These observations refer to at least four different spots on the Moon's surface and cannot all refer to the impact of the instrument container of *Lunik II*. However, more than one object may have hit the Moon. From the point of view of position, it will be noted that most of the observations are consistent with the radio result. Those not consistent in this respect are asterisked. Photographs of moderate quality taken from the Pic-du-Midi, and from G. A. Hole's Observatory at Patcham, before and after the impact of the instrument container, do not appear to confirm any of the above observations.

OBSERVATIONS WHICH MAY BE RELATED TO THE IMPACT OF *Lunik II*

Observer(s)	Location	Telescope	September 13, 1959 Univ time	Position on Moon	Description of phenomenon (and its duration)
J. G. Davies A. C. B. Lovell (ref. 1)	Jodrell Bank	250-ft. Radio-telescope	21h 02m 23s.	Within 7′ arc from centre of Moon's disk	Velocity of impact, ~ 3 ± 0·5 km./sec. (instantaneous cessation of radio signals)
P. Moore (ref. 2)	E. Grinstead	12½-in Reflector, × 300–400	21h. 02m 23 ± 2s.	+ 085, + 195	Pinpoint of light (< 0·5 sec.)
H. P. Wilkins (ref. 3)	Bexleyheath	15½-in. Reflector, × 300	21h 02m 23s.	Close to Schneckenberg	Pinpoint of light and dark ring (few seconds)
B. Balázs J. Balázs M. Lovas	Konkoly	7-in. Refractor	21h. 02m. 30s.	+ 024, + 434	Dark spot, 4 km. in diameter, expanding asymmetrically into a hazy, grey object elongated to N. Mean width then ~ 40 km. (14 min.)
P. A. Murray	Carrickfergus	6-in. Reflector, × 112	21h. 02m. 15s.	Auwers	Distinct brightening (1·5–2 sec.)
R. D. Williams	Carrickfergus	Small refractor, × 30	21h. 02m. 15s	~ Auwers	
S. Bradford*	South Shields	3-in. Refractor, × 120	22h. 03m.	Littrow	Dusky shading (> 17 min.)
A. Florsch	Strasbourg	6½-in Refractor, × 150	Some time between 21h. 01m. and 21h 05m	+ 340, + 250	Patch becoming as large as Plinius *A* and doubling its diameter in 3–4 min of time
R. G. Townsend*	Sanderstead	1 in Refractor, × 15	21h. 02m	Near junction of M. Seren. and M. Tran.	Black spot appearing to diffuse rapidly (~ 5 min.)
R. P. Townsend*	Sanderstead	2-in. Refractor, × 20	21h. 02m.	In vicinity of Littrow, Mac-Robius, and Römer	Jet black spot, expanding and turning dark grey (> 5 min.)

NEWS and VIEWS

National Institute for Research in Dairying: Dr. A. T. R. Mattick

DR. A. T. R. MATTICK, until September 30 deputy chief scientific officer on the staff of the National Institute for Research in Dairying at Shinfield, retired on that date, having reached the age limit. Apart from the period 1915–19, when he served in the First World War in the Royal Army Medical Corps, the whole of his working life has been spent at the Institute, which he has seen grow from very small beginnings to its present status as the outstanding dairy research institute in the Commonwealth, if not in the world. In 1919, he became a graduate assistant to Dr. R. Stenhouse Williams, and succeeded the latter as head of the young Institute's Bacteriology Department in 1929. He became deputy director in 1948, still retaining the headship of the Bacteriology Department. In October 1958, on the retirement of Prof. H. D. Kay, he became acting director.

The development, during the past thirty years, of sound methods of dairy hygiene, both in Britain and in countries abroad owes a very great deal to Mattick and his colleagues. When Mattick took it over, his Department at Shinfield had a scientific staff of three only, and its resources were meagre. With increasing funds and accommodation since 1933, and a carefully selected, growing staff, the early pioneer work was extended not only to cover the wide field of the application of microbiological science to the main problems of the dairy industry, but also to make substantial contributions to our basic knowledge of micro-organisms. Thus, on one hand, his laboratory was largely responsible for defining the exact conditions of heat exposure necessary in the continuous process now almost universally employed in Britain for the pasteurization of milk (conditions duly incorporated into the official regulations), and on the other hand, for the detection, isolation and identification of the interesting and powerful antibiotic nisin, produced by a streptococcus that he isolated from milk, and now being used industrially. These are but two examples from many that could be mentioned of the types of problems tackled under his direction. Most of the leading dairy bacteriologists in Britain, and many of those in other countries, have engaged in research for longer or shorter periods in his laboratory. His training there of these young and not-so-young postgraduates laid the essential foundation for the advisory bacteriological branch of the National Agricultural Advisory Service. Mattick retires from a strong, active department, now of fourteen graduates and twenty-four assistants, not only as the acknowledged doyen of British dairy bacteriologists but also with a world-wide reputation as an outstanding research worker in pure and applied microbiology. His able successor as head of the Bacteriology Department at Shinfield is W. A. Cuthbert, until recently a senior bacteriologist in the National Agricultural Advisory Service.

Preventive Medicine at Sheffield:
Prof. John Knowelden

DR. JOHN KNOWELDEN has been appointed to the chair of preventive medicine and public health in the University of Sheffield. Educated at King's College, London, and St. George's Hospital Medical School, London, Dr. Knowelden qualified in 1942, and after a short period as house surgeon at St. George's Hospital, he was a surgeon lieutenant in the R.N.V.R. during 1942–46. In 1947 he graduated M.B., B.S., in the University of London and was also awarded the D.P.H. with distinction. In the same year he was awarded a Rockefeller fellowship in preventive medicine, which he held during 1948–49 at the Johns Hopkins School of Hygiene and Public Health, Baltimore. In 1949 Dr. Knowelden was appointed to his present post of lecturer in the Department of Medical Statistics and Epidemiology at the London School of Hygiene and Tropical Medicine. Dr. Knowelden is a member of the Medical Research Council Statistical Research Unit and has been secretary of a number of committees of the Medical Research Council, including the Poliomyelitis Vaccines Committee which planned and executed the 1956 field-trials of British poliomyelitis vaccine. Dr. Knowelden is a joint editor of the *British Journal of Preventive Medicine*.

American Geographical Society: Awards

THE following awards have been announced by the American Geographical Society: *David Livingstone Centenary Medal*, awarded by the Society "for scientific achievement in the field of geography of the southern hemisphere", to William E. Rudolph, of New York City, former chief engineer of the Chile Exploration Company and now managing consultant of Dorr Consultants; *Cullum Geographical Medal* to Dr. Albert P. Crary, chief scientist for the U.S. Antarctic Research Project, for geophysical research in both the North and South Pole regions, and for geographical discoveries; *Daly Medal* to Dr. Richard Hartshorne, professor of geography at the University of Wisconsin, for his contributions to political geography and to "the history and methodology of geographic thought".

University Grants Committee: Appointments

To fill vacancies on the University Grants Committee, the Chancellor of the Exchequer has made four new appointments. The new members, whose appointments will expire on December 31, 1964, are: Sir Eric Ashby, master of Clare College, University of Cambridge; Prof. F. W. Rogers Brambell, Lloyd Roberts professor of zoology, University College of North Wales, Bangor; Prof. C. H. Philips, professor of oriental history and director of the School of Oriental and African Studies, University of London; and Prof. J. Monteath Robertson, Gardiner professor of chemistry, University of Glasgow. The retiring members of the Committee are: Prof. R. H. Matthew, professor of architecture, University of Edinburgh; Prof. P. B. Medawar, Jodrell professor of zoology and comparative anatomy, University College, University of London; Prof. A. Robertson, previously Heath Harrison professor of organic chemistry, University of Liverpool; and Sir George Thomson, master of Corpus Christi College, University of Cambridge, and emeritus professor of physics, University of London.

Zenith Reactor commences Operation

THE *Zenith* reactor at the Atomic Energy Establishment, Winfrith, Dorset, started operating for the first time on December 19. The final stages of commissioning the plant will be carried out during the next few months. The reactor has been built to operate under temperature conditions similar to those expected in a high-temperature gas-cooled power reactor. The reactor core consists of a nearly cylindrical assembly of 235 fuel elements, 8 ft. high and 4 ft. in diameter, in the form of graphite cylinders, containing pellets of fissile uranium oxide, fertile thorium oxide and graphite. The ends of the fuel elements are made of graphite which, with a 3-ft.-thick graphite annulus surrounding the fuel, form a reflector to return some of the neutrons escaping from the fuel into the core, so reducing the quantity of fuel used. The reactor core is enclosed in a pressure vessel through which nitrogen is pumped in a continuous closed circuit. The nitrogen is heated by a 200 kW. heater as it enters the core: the hot gas raises the mean temperature of the core to 800° C. At the top of the core the hot nitrogen is mixed with cooler gas before passing through the reflector: thus the reflector is kept at a mean temperature of 400° C. The reactor pressure vessel and associated plant are enclosed in an airtight containing building. The reactor itself will be operated at a peak neutron flux of 10^8 neutrons/cm.^{2}/sec. at a maximum nuclear power of 100 W.: the nuclear heat produced is thus negligible in comparison with the energy used to heat the core.

Zenith is controlled by neutron-absorbing rods in the graphite reflector. There are 30 control rod holes disposed in a ring around the core: 20 of these are occupied by motorized control rods and fixed absorbers may be loaded into the other 10 holes. Six flux-measuring chambers are arranged in other holes at the inner edge of the reflector. There are four pulse-counting fission chambers, two for use at high power and two at low power, and also two current fission chambers feeding shut-down amplifiers. Activity in the fuel elements will be at a low level because the reactor power will not exceed 100 W.; this permits easy rearrangement of the core. The reactor cost approximately £400,000, including design, construction and commissioning. For the first two years after commissioning *Zenith* will be used to check reactor physics design calculations for the *Dragon* high-temperature gas-cooled reactor experiment (see *Nature*, 183, 507; 1959).

Upjohn Cell Model at Royal Scottish Museum

FOLLOWING the recent interest in the two B.B.C. television programmes on "Science International", which featured Prof. Michael Swann, of the Natural History Department of the University of Edinburgh, and a group of scientists from world-wide sources, the notable background exhibit, the famous Upjohn model of a living cell magnified by 1,000,000 (Fig. 1), has been transported to the Royal Scottish Museum, Edinburgh, where it will be shown for six weeks. It was specially flown over from the United States for the two 1 hr. broadcasts, and has not been shown to the public anywhere outside the United States until its exhibition in Edinburgh at the middle of December. The model reproduces in 'Perspex', in three dimensions, the accumulated researches into cell structures employing light and electron microscopes over many years. The construction of the model was undertaken by the Upjohn Company, Kalamazoo, Michigan, and the research for it occupied some eighteen months, while the actual building, by Bill Burtin and his team of scientific model designers, took more than eight months. It is a hemisphere of 24 ft. diameter. First shown in June 1958 in San Francisco at the Convention of the American Medical Association, it was moved to a Health Exhibition in the Coliseum, New York City, and then to the Museum of Science and Industry, Chicago, Michigan In the Royal Scottish Museum it is attracting interested crowds ranging from school classes to university —particularly medical—students. In February it is to be flown back to the United States.

Training in the Use of Isotopes

THE second of the two self-propelled mobile radioisotope laboratories given to the International Atomic Energy Agency by the Government of the United States of America in April 1958 was handed over to an agency representative at the Oak Ridge Institute of Nuclear Studies on December 11. The mobile laboratories are specifically designed to provide the tools for basic training in radioisotope handling techniques. They can tour a geographical area visiting high-schools and universities, and thereby make a training course easily available. At the request of the Government of Mexico, this laboratory will be used at several training establishments and universities in that country during January, February and March 1960. In April, the laboratory will be sent to Argentina for a period of six months.

In Buenos Aires a course has been organized by the National Atomic Energy Commission of Argentina for the training of twenty-five experts from Latin American countries in the use of radioisotopes, especially in medicine and agriculture. For this purpose, the International Atomic Energy Agency is providing the services of two lecturers: Dr. Norman Veall from the Radioisotope Laboratory, Guy's Hospital Medical School, London, and Dr. Robert Harold Wassermann from the Laboratory of Radiation–Biology, Cornell University. Japan has put at the Agency's disposal twenty fellowships of six months duration at the Isotope School of the Atomic Energy Research Institute of Japan, for training in the handling and application of radioisotopes in different fields. The Agency has secured the services of Prof. Milorad Mladjenovic from the Boris Kidric Institute of Nuclear Science, Belgrade, and Prof. James Francis Duncan from the Radiochemistry Department, University of Melbourne.

The first mobile radioisotope laboratory has already been used for training purposes at the University of Vienna, and in Greece. It has just returned to Vienna after having been used at the Haus der Technik, Essen, Federal Republic of Germany, for training young radioisotope specialists, and it is expected to be used in the Far East during 1960.

Physiological Examination of a Live Whale

A 50-TON male finwhale beached on December 5 at Provincetown on the tip of Cape Cod, and Dr. John W. Kanwisher, of the Woods Hole Oceanographic Institution, and Dr. Alfred W. Senft, of the Marine Biological Laboratory, were able to carry out temperature measurements and to obtain a cardiogram before the whale died on the following day. The cardiograms showed a pulse beat of 25 a min. (human, 72 a min.) and an estimated size of the heart of about 225 kgm., compared to some 250 gm. for a human heart. Dr. Senft also determined the time-interval from the pacemaker to the contraction of the ventricle. As the condition of the whale deteriorated, there were changes in the cardiogram not unlike those seen in the human cardiogram when oxygenation is impaired; it appeared that the whale suffered a conduction block, a common defect in man's heart. While the cardiograms were being made, Dr. Kanwisher obtained temperature measurements and collected respiration samples from the whale's blowhole. The internal body-temperature was 92° F., while the fins and tails had a temperature of 50° F.;

initially the dorsal fin (used as a radiator) was much warmer. Gas samples taken from the whale's breath showed that the animal's lungs were not functioning well. It extracted only a third as much oxygen from the inhaled air as a human being does.

National Academy of Sciences—National Research Council

DR. KINZEL, vice-president for research of the Union Carbide Corporation, has been appointed chairman of the Division of Engineering and Industrial Research, National Academy of Sciences—National Research Council, in succession to Vice-Admiral Edward Lull Cochrane. The Division of Engineering and Industrial Research is one of eight divisions of the Academy—Research Council, a private organization of distinguished scientists devoted to the furtherance of science for the general welfare and to advising the Federal Government, upon request, on any matter of scientific or technical interest.

Textile Institute: Officers

DR. A. R. URQUHART, assistant director at the British Cotton Industry Research Association, and honorary secretary of the Textile Institute since 1958, has been elected chairman of the Council of the Textile Institute, in succession to Mr. G. Loasby, who has resigned due to business commitments. Mr. J. C. H. Hurd, head of the School of Textiles of Leicester College of Technology and Commerce, follows Dr. Urquhart as honorary secretary of the Institute. Mr. A. Draper, director of William Birtwistle Allied Mills, Ltd., Preston, continues in office as vice-chairman of Council, and Mr. A. F. W. Coulson, director of R. Greg and Co., Ltd., Stockport, continues in office as honorary treasurer.

Harrison Memorial Prize

APPLICATIONS for the Harrison Memorial Prize for research in chemistry are invited, and should be submitted to the selection committee not later than September 1. The prize is open to natural-born British subjects less than thirty years of age on December 1, 1959, and consists of a bronze plaque and a payment of 100 guineas. The selection committee consists of the Presidents of the Chemical Society, Royal Institute of Chemistry, Society of Chemical Industry and Pharmaceutical Society. Further information can be obtained from the President, Chemical Society, Burlington House, Piccadilly, London, W.1.

University News: Belfast

THE following appointments to lectureships are announced: Dr. A. K. Galwey and Dr. B. D. Flockhart (physical chemistry); Dr. A. Scott (zoology); R. Tavener-Smith (geology); and W. E. Glover (physiology).

London

PROF. K. G. DENBIGH, professor of chemical technology in the University of Edinburgh (see *Nature*, 176, 583; 1955), has been appointed to the University chair of chemical engineering science tenable at the Imperial College of Science and Technology from October 1960 in succession to Prof. P. V. Danckwerts, who has taken over the Shell chair of chemical engineering in the University of Cambridge. Dr. G. H. Williams, lecturer at King's College, has been appointed to the University readership in organic chemistry tenable at Birkbeck College.

Announcements

THE Liverpool Geological Society Medal has been presented to Dr. J. C. Harper, senior lecturer in the Department of Geology, University of Liverpool, in recognition of his work on the Ordovician and Silurian faunas of North Wales and Ireland, and his services as an officer of the Society.

MR. J. H. GLOVER has been co-opted as secretary of the Polarographic Society in succession to Mr. W. J. Parker, who has resigned. All communications to the Society including subscriptions should be sent direct to Mr. Glover at 75 Craven Gardens, Wimbledon, London, S.W.19.

THE Institute of Welding has organized a Christmas Lecture with demonstrations, for young people, on "The Magic Arc", which is to be given by Prof. H. O'Neill. The lecture will take place on January 5 at the Institute, 54 Princes Gate, Exhibition Road, South Kensington, S.W.7. Further information can be obtained from the Secretary of the Institute at the above address.

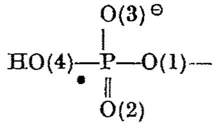
THE Society of Motion Picture and Television Engineers is organizing the fifth International Congress on High-Speed Photography, to be held in Washington, D.C., during October 16–22. In order to facilitate the organization of the Congress, it is desirable that intending authors should present their papers through their national delegate. Summaries must be received by February 16. Further information can be obtained from Dr. R. F. Saxe (United Kingdom national delegate), Queen Mary College, Mile End Road, London, E.1.

A COLLOQUIUM entitled "Proteins of the Biological Fluids" has been organized by St. Jans Hospital, Bruges, during May 6–7. This is the eighth colloquium of its kind to be held by the Hospital. Further information can be obtained from Dr. Hub Peeters, St. Jans Hospital, Bruges, Belgium.

AN International Symposium on Fermentation will be held in Rome during May 9–14, under the auspices of the Istituto Superiore di Sanità (Italian Institute of Public Health), the American Chemical Society (Fermentation Subdivision) and the Società Chimica Italiana. It will consist of scientific papers and panel discussions by invited participants, and is open to all interested scientists. Subjects covered will include fermentation technology (oxygen transfer, fermentor design, etc.), fermentation chemistry and fermentation biology. All inquiries should be addressed to: Fermentation Symposium, Istituto Superiore di Sanità, Viale Regina Elena 299, Rome.

A SYMPOSIUM on 'Inhaled Particles and Vapours' has been organized by the British Occupational Hygiene Society, and will be held in Oxford during March 29–April 1. Further information can be obtained from Dr. J. S. McLintock, Medical Service, National Coal Board, Hobart House, London, S.W.1.

ERRATA. With reference to the communication entitled "Crystal Structure of L-Serine Phosphate" in *Nature* of December 12, p. 1863, Prof. J. Monteath Robertson points out that in the last line on p. 1863, 103 per cent should read 10·3 per cent. Formula II is incorrect and should be:



$$\begin{array}{c} \mathrm{O(3)}^{\ominus} \\ | \\ \mathrm{HO(4)—P—O(1)—} \\ \| \\ \mathrm{O(2)} \end{array}$$

FLORA EUROPAEA IN VIENNA

THE first full meeting of the Flora Europaea Organization was held in Vienna during April 1–7, 1959, at the Naturhistorisches Museum. The international gathering included botanists from Austria, Belgium, Denmark, Finland, France, Germany, Hungary, Iceland, Italy, Jugoslavia, Norway, Poland, Roumania, Sweden, Switzerland, Spain, as well as members of the British Editorial Committee. As editors, advisers and consultants of Flora Europaea they had come to discuss ways and means of consolidating the progress already made in the project and to debate the various theoretical and practical problems which have arisen so far.

The meeting, officially a 'round table symposium', was organized by the Editorial Committee, and the local arrangements were made with the assistance of a preparatory committee of Austrian botanists under the chairmanship of Dr. K. H. Rechinger, director of the Botanical Department of the Museum. The Austrian Ministry of Education contributed to the local expenses, and the International Union of Biological Sciences made a grant to assist members attending. Introductory addresses were given by Prof. H. Strouhal, director of the Museum, Dr. K. H. Rechinger, and the chairman of the Editorial Committee, Prof. T. G. Tutin (Leicester). Prof. Tutin recounted the history of the project, which originated as a result of discussions at the eighth International Botanical Congress held in Paris in 1954. He outlined the principles which had guided the Editorial Committee in its decisions on the size, limits and scope of the work. It was essentially an attempt to summate in one work the essence of taxonomic research made on European plants during the past two centuries, and provide a concise and modern Flora of Europe.

The main work of the meeting was divided into formal sessions in the mornings, during which papers were presented and discussed, and informal afternoon sessions, during which various practical problems were considered. These informal discussions contained much valuable material, which is being edited for inclusion with the main papers in the publication of the proceedings.

The first major topic dealt with was the taxonomy of apomicts. Prof. D. H. Valentine (Durham) gave a paper outlining ways in which the Committee suggested the different kinds of apomictic groups could be treated. It was difficult to lay down general principles for the treatment of all groups since our knowledge of them is so uneven. In dealing with *Hieracium*, *Taraxacum*, *Rubus*, *Ranunculus auricomus*, *Potentilla*, *Alchemilla* and Gramineae, he attempted to set the taxonomic problems against the background of our knowledge of the apomictic mechanisms and the evolutionary potentialities of the groups. Such an evolutionary approach, although not always of direct value, often helped the taxonomist to assess what could be attempted and how far he could go. In *Rubus*, for example, new populations are being constantly produced by hybridization, whereas in most of the *Alchemilla vulgaris* group no hybridization is known. Both groups have been fairly thoroughly investigated by taxonomists, but these evolutionary facts should have a bearing on future attempts to produce workable taxonomic treatments. The problem for Flora Europaea was largely one of devising methods for curtailing and limiting the accounts. Only widely distributed taxa should perhaps be described and endemic taxa dealt with briefly, if at all. All apomictic groups will be dealt with by normal taxonomic methods and will be placed in aggregate species, subspecies or, in exceptional cases, varieties. Experimental categories such as 'agamospecies' will not be used in the Flora, but reference to reproductive mechanisms and other relevant points may be made in the form of observations in the text. This paper was extensively discussed, and particular attention was directed to the procedure of Marklund in his treatment of Fennoscandian *Ranunculus auricomus* representatives, which he grouped into four aggregates which were differentiated morphologically, ecologically and geographically. It was the opinion of several speakers that a similar treatment could be applied to the whole of Europe.

Prof. B. Pawlowski (Cracow) gave the second paper. He made four principal points: (*a*) for apomicts current taxonomic categories should be employed; (*b*) the degree of differentiation of apomicts varies from group to group; (*c*) the most appropriate method of treatment should be left to the author of a particular group to decide; and (*d*) extensive descriptions should be permitted as a departure from the normal abridged ones of Flora Europaea.

In the general discussion the point was made that the level of treatment possible in any apomictic group depended on a number of factors such as the kind of apomixis, the number of taxa likely to be involved, their stability, the treatments already published and how far they could be applied to Europe as a whole. Prof. R. Nordhagen (Oslo) suggested that the term vegetative apomixis was misleading and should be replaced. He believed that phylogenetic lines should be followed in the treatment of such groups as *Taraxacum* and *Hieracium*, but about *Rubus* he would not speak. Prof. H. Merxmuller (Munich) proposed that in the *Ranunculus auricomus* group not only the extreme forms (*R. auricomus* and *R. cassubicus*) should be given, but also 'central' forms under which taxa not belonging to the corner forms could be accommodated. For *Taraxacum* he proposed as models the treatment given by Bocher, Holmen and Jakobsen in "Grønlands Flora" and van Soest's survey of the phytogeography of the genus. The sections recognized are more or less equivalent to aggregates. Keys to this level should be sufficient with further information on apomicts of special interest. For *Hieracium* a possible method would be to follow Janchen in regarding Zahn's *Arten* as aggregates and joining the *Unterarten* in *greges*, the keys not going farther than this level. The number of Zahn's *Zwischenarten* would have to be greatly reduced by the exclusion of primary hybrids. Prof. W. Rothmaler (Greifswald) stressed that apomixis is only one of numerous methods in the plant kingdom and that there was not in principle a basic difference between a persistent inbreeder and an apomict. Normal taxonomic methods should be applied to these groups. Dr. A. Love (Montreal) considered it unfortunate that many taxonomists adhered to the dictum of Winge that the description of hundreds of so-called apomictic species was laying "too much stress on immaterial bagatelles", rather like the collecting of postage stamps. Recent biosystematic studies had shown that apomictic taxa may be of considerable geographical and evolutionary importance. A practical solution could be achieved by combining the system of Turesson (using special categories agamospecies, agamotype, apomict) and that of Marklund. Thus, if the term agamospecies is accepted for apomictic microspecies as approximately the same level as the subspecies proposed by Marklund (and at a lower level than proposed by Turesson) it could be incorporated into the taxonomic system as a category at the subspecific level. The inclusion of only agamospecies at subspecific level would automatically indicate that the species itself is agamospermous, while the inclusion of one or more subspecies also would show that sexual seed formation is also known to occur in the species. Dr. N. Hylander (Uppsala) felt that such a system would not be workable since it was not known in many cases to what extent a species was agamospermous, and therefore such terms as hemiagamospecies would have to be introduced.

The second set of papers dealt with problems of geographical distribution and taxonomy. Prof. H. Meusel (Halle) read a paper outlining his system for indicating the distribution of species by means of formulæ. This system is based on three main elements —countries, floral elements and geographical coordination (floral zones, oceanity-continentality, and 'étages'), and together with distribution maps summarizes a great deal of information in a short space (see Meusel, H., "Arealformen und Florenelemente als Grundlagen einer vergleichenden Phytochorologie" in *Forsch. und Fortschur.*, 33, 163 ; 1959). Meusel's scheme was greatly admired, and it was hoped that it could be extended to the whole of Europe, but it was felt that the limiting factor was the technical one of amassing and processing the data for thousands of species, especially from understudied floras, in time for inclusion in Flora Europaea. Moreover, the number of symbols involved was a serious drawback in a general Flora.

This provoked an illuminating debate about the source and reliability of data used in indicating extra-territorial distributions in Floras in general. The indication in a more or less summarized form of the total distributions of species is almost traditional in most Floras. Dr. V. H. Heywood (Liverpool, secretary of the Editorial Committee) doubted the validity of these data in most cases, since they were almost invariably copied from the literature and errors were thereby perpetuated. Flora Europaea was not intended to be a handbook of plant geography. Prof. D. H. Valentine emphasized the difficulty of knowing whether the species were the same in the various countries from which they are recorded according to these total distributions. Dr. Heywood then talked on some of the problems of taxonomy and distribution in the West Mediterranean, especially the Iberian Peninsula, many parts of which are inadequately known from a floral point of view. This contrasted with taxonomically well-studied areas such as Scandinavia and Central Europe and created grave problems for the authors and editors of the Flora. One result of inadequate exploration in the Iberian Peninsula was that patterns of distribution were far from clear. Gaps may be due to incomplete knowledge and not to the fact that the species concerned show discontinuous areas. The concern here was with basic taxonomy, and there is virtually no cytological or experimental information available. The treatment of three kinds of endemics was considered: endemic vicariant species such as *Ptilotrichum reverchonii* (S.E. Spain) and *P. pyrenaicum* (Pyrenees), where the temptation to unite them should be resisted despite their close morphological similarity; Wettsteinian subspecies showing good geographical pattern with areas of overlap; and micro-endemic vicariants. The latter kind has proved difficult to deal with satisfactorily and is typical of the Mediterranean mountain flora, where each range or peak may have its own endemic representative of a species. Populations have been fragmented into discrete units, but each one is only slightly different from the next, however constant the differences may be. Currently these units are regarded as varieties, subspecies or species, and some uniformity should be introduced to deal with this frequent phenomenon.

The species versus subspecies question was also considered by Dr. K. H. Rechinger in his paper on distributional problems in South-east Europe, where he considered dealing with 8,000 species in the Balkan Peninsula. Although there were many similarities between South-east and South-west Europe, there were a number of differences in climate, physiography, coastlines, etc., which altered the kind of problems found. In the east, one concerned the problems of the island floras with their endemic races, and many years experience had convinced him of the need for a fairly narrow species concept in polymorphic complexes until a detailed revision was possible. Prof. H. Merxmüller (Munich) spoke on the taxonomic treatment of Alpine vicariants, where again the species versus subspecies problem arose. Not all Alpine vicariants could be placed in either category but should be considered for such treatment whenever they showed satisfactory morphological separation coupled with geographical distribution. The important point was to be consistent in their treatment within a group. Too close an adherence, however, to the Wettstein geographical-subspecies method could lead to absurd results whereby species were divided into a series of boxes of little meaning.

The taxonomic treatment of polyploidy was the subject of another set of papers. Prof. W. Rothmaler in his discourse on "Taxonomy and Genetics" said that the working methods and principles of taxonomy must not be mixed with those of genetics. Each taxon corresponds to a concept the extent and importance of which is determined by taxonomic methods. In a species concept, all information, morphological, geographical, ecological and physiological, must be combined with genetical, anatomical and other evidence, but no one line of evidence should be given a greater level of importance than any other. Thus, as regards polyploidy, the chromosome status should be regarded as a valuable aid for the definition of a taxon but should not be given greater importance than any character of internal or external morphology. Similar considerations applied to apomicts. Chromosome numbers may vary as much within a species or subspecies, as they remain constant within a large genus or even part of a family. Dr. V. H. Heywood then gave a paper on "The Taxonomy of Polyploids in Flora Europaea", which was an attempt to suggest practical solutions for dealing with this kind of problem in the Flora. He agreed with Rothmaler's view that no one character or line of evidence is *per se* sufficient to indicate specific status. The bearing of polyploidy in an experimental or genetic special classification is quite different, he suggested, from its value in a taxonomic framework. He dealt with autoploid, alloploid and polyploid complexes, although agreeing that it was not always meaningful or even possible to distinguish between these situations. He proposed that 'cryptic' polyploids should receive no taxonomic recognition, although their existence, and if possible their distribution, should be noted in observations. 'Semi-cryptic' polyploids may be amenable to treatment as varieties, subspecies or in exceptional cases species. Distinct autoploids are undoubtedly rare and should receive specific rank only when they are constantly recognizable; otherwise, if intermediates are known and especially if their geographical areas overlap, they should be given subspecific or varietal rank. Taxa which have arisen by polyphyletic (polytopic) polyploidization should be considered grades *sensu* Huxley and treated as varieties or even forms. Dr. Hylander agreed almost entirely with these views, whereas Dr. A. Löve disagreed almost entirely and proceeded to elaborate his arguments in a paper, "Taxonomy and Chromosomes—a Reiteration". He considered that Flora Europaea should be the beginning of a new era in European taxonomy, not the end of an old outdated epoch. The chromosomes are not just another character comparable to the superficial morphological characters which taxonomists are forced to use in the identification of herbarium material. They determine the characters, whereas the characters do not determine the chromosomes. Changes in the chromosomes determine the divergent evolution of ecotypes and races and then the effective isolation of species, genera and families. The only logical rule for the classification of taxa differing in chromosome number is to name them as distinct species. The ensuing discussion was lively. It was agreed that as much cytotaxonomic information as possible should be given in the Flora, although people were not entirely agreed on its taxonomic importance. A liberal use of species aggregates was a possible solution for morphologically similar (though not identical) cytotypes.

A botanical excursion was arranged by Dr. F. Ehrendorfer on the Monday to Burgenland and Neusiedlersee. The view of the Danube, the large lake and the fascinating salt steppes, combined with the rich spring flora to make it a memorable day. In the evening the participants were given a banquet by the local Government Council at Rust, at which Government Councillor Kunnert mentioned the cultural and scientific traditions of Burgenland—for example, here lived Haydn and the celebrated botanists Clusius and Kitaibel.

The final sessions dealt with the problems of cultivated, escaped and adventive plants. Dr. N. Hylander spoke on his experience with similar problems in the Scandinavian flora. Not only plants of natural habitats but also those growing in localities created or strongly influenced by man had to be considered. Similarly, some of the species growing wild were intentionally or unintentionally introduced by man. It was often impossible to distinguish clearly between these different types. Prof. J. Jalas (Helsinki) gave a paper on "Treatment of the Aliens in Flora Europaea". The alien element could be considered as belonging to the following groups: (1) naturalized or established aliens of extra-European origin; (2) European species occurring in some parts of the area merely as (*a*) naturalized or established aliens, or (*b*) casual adventives. If thoroughly naturalized in one or more European countries the aliens should be described and keyed normally, irrespective of their degree of commonness. Taxa native only outside Europe should be marked with a special sign. The same sign should be used to indicate territories in which native European species are only naturalized. The territories within which a species, whether European or not, occurs as a casual should be enclosed in square brackets. In a second paper he illustrated the valuable data that can be obtained about variable species such as *Medicago lupulina* from countries near the outer limits of their permanent occurrence.

Mention must be made in conclusion of the generous hospitality of the Minister of Education and the Bürgermeister of Vienna, both of whom gave receptions for the participants. A meeting in Vienna would be scarcely complete without a visit to the Wienerwald, and this was also arranged by the city authorities, ending with a Heuriger at Heiligenstadt where, in true botanical tradition, the 'new' wine was liberally sampled. Altogether, the symposium was one of the most successful and certainly the most enjoyable which even Prof. Lüdi could remember.

V. H. HEYWOOD

EFFECT OF SOAP ON THE DIFFUSION OF WATER THROUGH ISOLATED HUMAN EPIDERMIS

By F. RAY BETTLEY and ELAINE DONOGHUE
Institute of Clinical Research, Middlesex Hospital, London

THERE is reason for supposing that soap and other detergents increase the permeability of the skin. Thus, Kvorning and Svendsen[1] found that if 1 per cent 'Teepol' is incorporated with the test solution, patients sensitive to chromium and nickel react to a lower concentration than if chromium or nickel salts are used alone. Skog[2] found that pretreatment of the skin with soap or non-soap detergent led to a higher proportion of irritant reactions from dinitrochlorbenzol. Burckhardt[3] pretreated the skin with soap and found that the damage so inflicted predisposed to the experimental development of nickel sensitivity; but in his experiments gross damage was inflicted on the skin by the alkaline soap. This was perhaps more comparable with the increased sensitization to dinitrochlorbenzol obtained by Rockwell[4] in skin which was prepared by sand-papering.

The barrier which prevents passage between the tissues and the outside has been much investigated and is reviewed by Rothman[5]. It lies between the corneous layer and the Malpighian layer and is not identifiable with histological precision. According to Rothman, it is an electric double layer with hydrogen

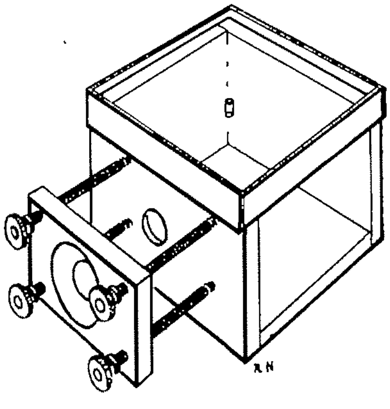


Fig. 1

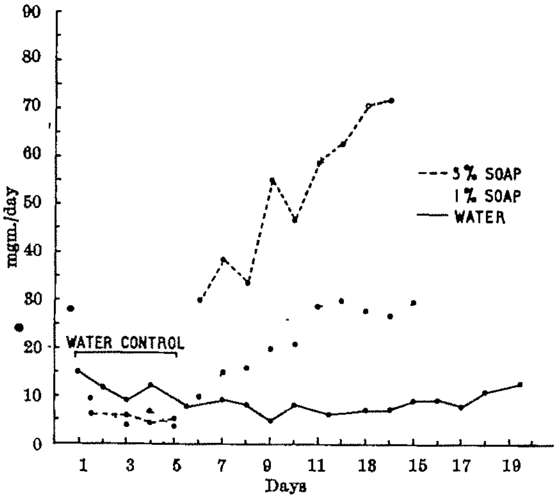

Fig. 2

ions on one side and hydroxyl on the other. It is impermeable or nearly so to water and to electrolytes; but allows the passage of lipoid-soluble substances. In the present studies isolated epidermis has been used for measuring the diffusion of water across this barrier layer.

The diffusion of water through isolated skin has been studied by various techniques. Burch and Winsor[6] and Berenson and Burch[7] used full-thickness skin which they placed over the end of a brass cylinder containing wet cotton wool. They found that the rate of water diffusion depended upon temperature and humidity, but was fairly constant over a temperature-range of 15–25° C. and of humidity between 20 and 60 per cent. Winsor and Burch[8] also measured water diffusion through the skin *in vivo*; they sealed a brass chamber to the skin of the abdomen and measured the amount of water vapour given off to dry nitrogen which was circulated through the chamber. It is important to note that they found the loss of water through intact living skin to be the same as that through dead skin measured by their brass cylinder method. This presumably indicates that there is no vital process involved. Mali[9] reached a similar conclusion; he used epidermis which had been separated by the heat method of Baumberger *et al.*[10]. Sheets of epidermis were sealed over cups of water and the loss of weight estimated at varying temperatures and humidities. Mali found that fresh living skin removed at operation gave the same results as post-mortem skin which had been dead for as long as two or three months.

In all these experiments it has proved possible to obtain constant measurements of loss of weight which presumably represent a steady diffusion of water vapour across the epidermal barrier which is independent of sweating or any other vital process. The present experiments were designed to study the effect of soap and other cleansers on this barrier layer.

The skin used was taken from the anterior abdominal wall one or two days after death. Subcutaneous fat was scraped off and the skin placed on the bench with the epidermis downwards. A beaker containing water at 80° C. was placed on the skin for 60 sec. The water was then emptied and the beaker inverted with the skin still adhering to it. The epidermis could then be stripped easily.

Cells were made of 'Perspex' about 4 cm. cube (Fig. 1). In one side of this cell was a circular window 7 mm. in diameter with bevelled edges over which the epidermis was placed. This was secured by a 'Perspex' plate clamped into position and lightly smeared with 'Vaseline' so as to make a water-tight joint. The cell was then filled with water to a level that just covered the epidermal window. In order to prevent evaporation from the open surface of the water, a layer of liquid paraffin was floated on (liquid paraffin shows no appreciable loss from evaporation in the conditions of the experiment). The cell was covered with a lid with a small perforation so that the pressure inside the cell was the same as that outside the window.

The room temperature was constantly between 24° and 25° C.; humidity varied between 50 and 65 per cent.

The cell was weighed as nearly as possible every day. When a piece of sheet rubber was clamped over the window the weight remained constant. Loss of weight was assumed to be due to the passage of water or water vapour across the epidermal window.

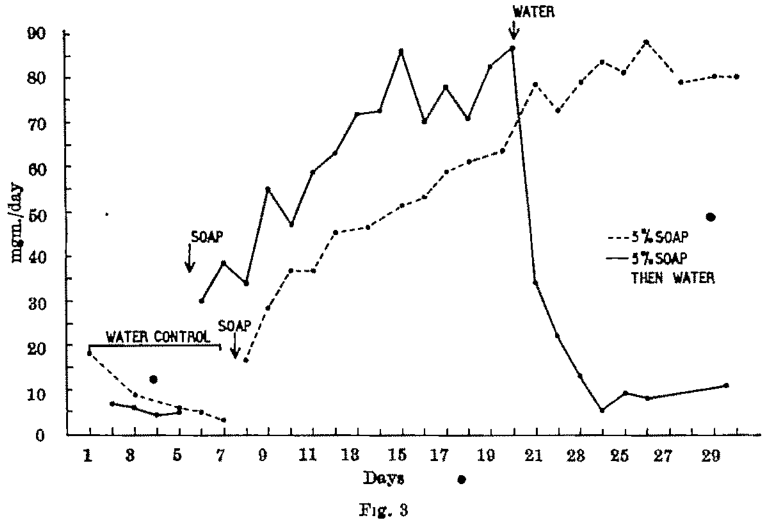

Fig. 3

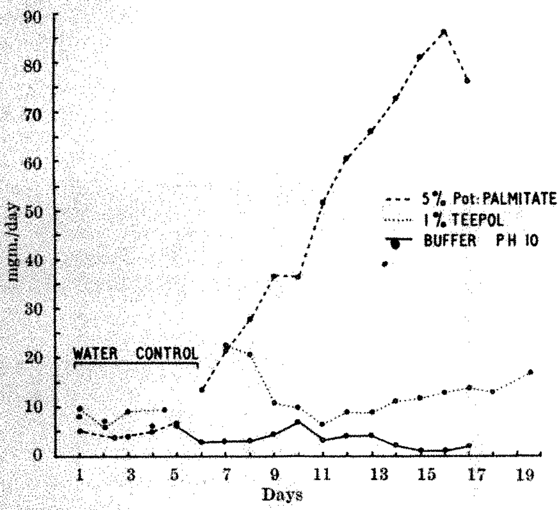

Fig. 4

In various experiments the water was replaced by aqueous solutions of soap, alkaline buffer and a non-soap detergent. Soap solution was made from the ordinary toilet soap provided for use in National Health Service hospitals in 1958. It is a toilet soap of good quality without free alkali or builders. 1 per cent and 5 per cent solutions were made with distilled water. Potassium palmitate was prepared from pure potassium hydroxide and palmitic acid in equimolecular proportions. 5 per cent solution was made with distilled water. 'Teepol' (Shell Chemical Co., Ltd.) is a soapless detergent consisting of secondary alkyl sulphate. 1 per cent and 5 per cent solutions were made with distilled water. Bile salt solution was made from purified ox bile salt, 1 per cent in distilled water. The buffer was the standard carbonate–bicarbonate buffer at *p*H 10.

In Figs. 2–4 are shown curves of individual experiments which are typical of the results in various groups.

When the cell contained tap water there was a steady loss in weight of about 5–10 mgm. daily. In prolonged experiments regular loss was continued over eighteen days during which the permeability of the epidermal membrane remained fairly constant (Fig. 2). After this, some preparations appeared to deteriorate in that loss of weight started to rise. It was thought that this might indicate disintegration of the epidermal barrier layer, and subsequent experiments were therefore usually limited to about that period. In the first day or two after the start of each experiment the initial loss was somewhat greater, perhaps because of a small amount of water remaining on the outside of the cell after the preparation had been set up. Small daily variations occurred and we cannot account for these. They were probably not attributable to changes in ambient temperature and humidity since when two cells were placed side by side in identical conditions they might show different variations, one losing more, one less than the daily average. Occasionally, also, an experiment gave unexpected results which could not be repeated and which were quite unlike other similar experiments. Some at least of these were probably due to errors which are not easy to recognize in any individual preparation. Such sources of error are minute damage to the epithelium which may occur particularly in relation to hair follicles during separation; imperfect sealing of the edges of the epithelial window; damage to the epithelium by the clamp which holds it in place; and contamination of the epithelium with paraffin. In all the subsequent experiments the behaviour of the epidermis with plain water was first observed for at least five days in order to make sure that it was normal.

The effect of putting soap solution into the cell was striking (Fig. 2). There was a rapid and progressive increase in loss of weight, which became more and more each day. With 5 per cent soap the daily loss of weight became constant after 8–10 days at a level of 70 mgm. or more, that is, ten times the rate of water; 1 per cent soap gave similar but less-marked effect, a maximum of 25–30 mgm. being reached in 5–7 days. The loss of weight remained at this high figure for at least several days, but when the soap solution was removed and replaced by water the rate of loss of weight returned rapidly to normal (Fig. 3). This presumably indicates that even after several days exposure to 5 per cent soap the epidermal barrier, though temporarily more permeable, is not essentially or permanently damaged. Similar results were obtained with 5 per cent potassium palmitate solution (Fig. 4).

It might be thought that the penetration of soap solution was due to its low surface tension allowing it to flow more readily through minute channels in the epidermis. We found, however, that if unglazed porcelain were placed over the window instead of epidermis the passage of soap solution was less rapid than that of water. Furthermore, when 1 per cent bile salt, which has a low surface tension, was put in the chamber the rate of diffusion through the epidermis remained about normal.

The presence of alkaline buffer at *p*H 10 in the chamber did not affect the rate of loss of weight (Fig. 4). 'Teepol' 1 and 5 per cent gave a loss of weight somewhat above that of water, up to about double, but not comparable in degree with the effect of soap (Fig. 3). These 'Teepol' solutions are slightly acid, but when buffered to about the same alkalinity as soap (*p*H 10) made no difference.

All these results were consistently repeatable in numerous experiments.

These experiments were carried out because we thought they might throw some light on the irritancy of soap solutions for the normal skin. Patch tests with soap and with a variety of other substances suggested that irritancy might be related in part to the power of soap to penetrate the epidermal barrier more efficiently than alkalis and other cleansers. The experiments recorded indicate that soap solutions have indeed the property of making the epidermis very much more permeable to water than is normal.

Winsor and Burch[8] found that the permeability of whole skin was so increased by scraping off the epidermis that the rate of loss of water was ten times that of intact skin, and was then the same as the rate of loss through pleura, heart muscle and other tissues. Comparing our results with these, it seems that the greatly increased permeability in contact with soap solutions represents virtually the complete loss of the epidermal barrier. This is far greater than the effect of 'Teepol' in a comparable detergent strength, suggesting that the cleansing or detergent property of soap and 'Teepol' is not the same as its penetrative effect. This is of interest for two reasons: First, because it lends some support to the suggestion that penetration of the epidermis rather than detergency may be important in the production of skin irritation since patch tests with 'Teepol' show far less irritation than soap; secondly, because this may throw some light on the nature of the epidermal barrier. Berenson and Burch[7] showed that treatment with lipoid solvents increased the permeability of the skin, from which it seemed that fat-soluble substances formed the essential part of the barrier. The action of a detergent, dissolving or emulsifying these fatty substances, might be supposed to be of a similar nature. Mali[9], in reviewing his own work and that of previous investigators, concluded that the barrier zone is a network of keratin fibres holding fatty substances in its meshes. This would explain the action of fat solvents and of detergents in destroying the barrier. Our experiments, however, indicate that 'Teepol' possesses this property much less than soap although it is a good detergent. More important still, we have observed that the effect of soap is reversible, and that the greatly increased permeability of the skin in contact with soap solutions returns to normal in a few days when soap is removed. This presumably indicates that the action of soap in increasing permeability cannot be due to its removing fatty or other substances from the barrier zone. Although we can draw no positive conclusions from our results, they seem to be more in conformity with Rothman's conception of a physico-chemical barrier. The barrier is made more permeable by soap without being permanently destroyed as it would be if fat solvency or detergency were responsible.

We are indebted to the Clinical Research Committee of the Middlesex Hospital for laboratory facilities and for a personal grant to one of us.

DEMYELINATION IN LAMBS BORN OF EWES MAINTAINED ON HIGH INTAKES OF SULPHATE AND MOLYBDATE

By C. F. MILLS and B. F. FELL

Rowett Research Institute, Bucksburn, Aberdeen

IN the course of studies to investigate the mechanisms underlying the interference with copper metabolism caused by high dietary intakes of molybdate and sulphate, the opportunity has been taken to examine the possible effects of such diets fed to pregnant ewes on the development of lambs after birth.

Eight two-year-old Cheviot ewes were divided into two groups one month after mating and fed the following diets daily: Group 1, 1 kgm. commercial grass cubes (copper content 5·0 μgm./gm.) supplemented with sodium sulphate to provide an intake of 10 gm. sulphate; group 2, 1 kgm. grass cubes supplemented as above and also with ammonium molybdate to give an intake of 50 mgm. molybdenum/day. This level of feeding was maintained to within one month of lambing, when the food offered was increased to 1·2 kgm./day. Tap water purified by

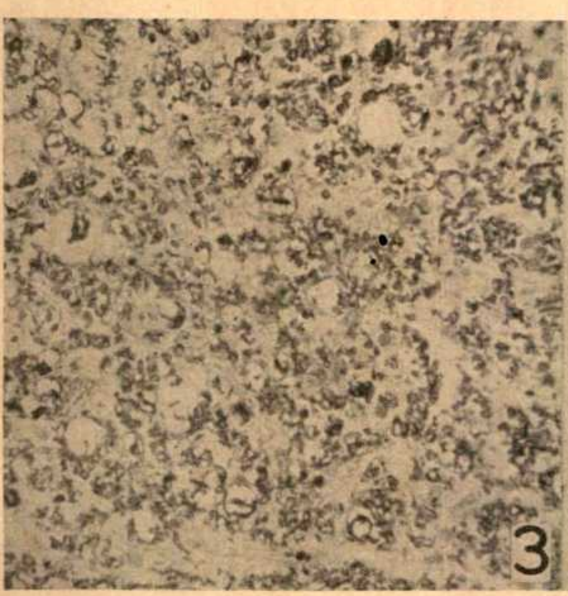
Fig. 2. Neurones of normal appearance in the red nucleus of a lamb from group 1. (High-sulphate diet.) Hæmatoxylin and eosin. (× 340)



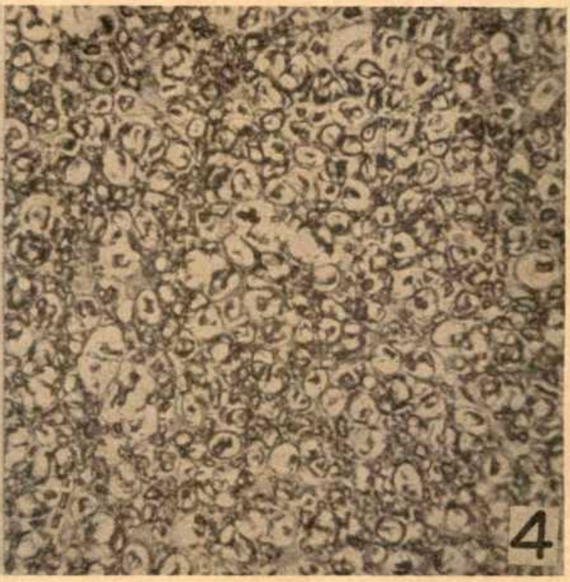


Fig. 3. Loss of myelin in a dorso-lateral column of white matter in the spinal cord of a lamb from group 2. (High-sulphate and high-molybdate diet.) Iron alum – hæmatoxylin. (× 280)

Fig. 4. Spinal cord of a lamb from group 1, showing absence of damage. This field corresponds with that shown in Fig. 3. Iron alum – hæmatoxylin. (× 280)

passage through an 'Elgastat Major Deioniser' (Elga Products, Ltd., London) was offered *ad lib.* in polythene buckets. One ewe of group 1 died after eighteen weeks on the experiment. All the remaining ewes lambed normally. Where twins were born, one animal was killed for liver-copper analysis immediately after birth. Inco-ordination of the hind limbs, progressing to affect both hind and fore limbs, appeared in one lamb of group 2 within three days of birth. Of the three remaining lambs in this group, a marked ataxia developed in one at eighteen days and another at sixty days of age.

Ataxic lambs were killed for autopsy and histological examination by being bled-out under pentobarbitone sodium anæsthesia. No macroscopic lesion was found during autopsy. Histological examination of the central nervous system was confined to the cerebral hemispheres posterior to the lateral cerebral fissure, the mesencephalon in the plane of the red nucleus and the cervical region of the spinal cord. Tissues were stained by Lillie's variant of the Weil–Weigert method for myelin, by the Marchi method for degenerating myelin and by hæmatoxylin and eosin. Lesions were recognized using all these preparations. There were degenerative changes consisting of chromatolysis progressing to loss of nuclei and all cytoplasmic detail in the large motor neurones of the red nucleus (Fig. 1). In one case such degeneration was present in the neurones of the ventral horns of grey matter in the spinal cord. Degenerative changes in the nuclei with shrinkage and loss of cytoplasm were present in the pyramidal cells of the cerebral cortex. The myelin of the cerebral sub-cortex was beaded or lost in diffuse, patchy areas, and in these areas the brain tissue was spongy with marked pericellular and perivascular spaces. The spinal cord in the neck showed a symmetrical diffuse demyelination in the dorso-lateral columns of white matter (Fig. 3) and in the ventro-lateral and ventral columns up to the median fissure. There was no 'cuffing' or cellular reaction suggestive of infection.

These lesions are closely similar to those described in field-cases of 'swayback' in lambs[1]. None of these degenerative changes was present in tissues prepared from lambs of group 1 (Figs. 2 and 4).

The results of copper determinations on livers from ewes and lambs are given in Table 1. The feeding of 10 gm. sulphate/day to ewes in group 1 resulted in the depletion of liver-copper stores to exceedingly low levels (mean : 8·8 μgm./gm. dry matter compared with a range of 186–1,374 μgm./gm. for 'normal' mature ewes and 7–106 μgm./gm. for copper-deficient ewes quoted by Cunningham[2]). Liver-copper levels of lambs in this group were low at birth and remained

Table 1. LIVER-COPPER OF EWES AND LAMBS ON DIETS CONTAINING SUPPLEMENTARY SULPHATE WITH AND WITHOUT ADDED MOLYBDENUM

Ewe No.	Treatment supplement	Liver copper (μgm./gm. dry matter)			Age at first signs of ataxia	Age at slaughter
		Ewe	Lamb killed at 1 day of age	Lamb killed when severely ataxic or at termination of exp.		
Group 1						
329	Sulphate (Group 1)	8·0	—	9·8	N*	100 days
56		11·6	10·8	8·1	N	103 days
38		8·3	8·9	9·5	N	87 days
28		7·3	(died before lambing, pregnancy toxæmia, twin lambs in uterus)			
Group 2						
181	Molybdenum sulphate (Group 2)	23·4	—	2·8	3 days	11 days
332		24·5	3·4	2·9	18 days	23 days
46		32·1	8·6	4·3	60 days	77 days
25		28·8	—	13·5	N	108 days

* N indicates no signs of ataxia up to termination of experiment.

R319

low afterwards (overall mean : 9·1 μgm./gm. compared with the 'normal' range of 74–430 μgm./gm., ref. 2), falling within the range reported for field-cases of copper-deficiency (4–34 μgm./gm., ref. 2). No case of ataxia was noted in lambs of this group, and growth and general condition in the period before slaughter remained excellent. This finding is not in line with the experiences of Marston[3], who concluded from field-experiments that ataxia is likely to develop in the lamb if the copper in the liver of the ewe falls to less than 20 μgm./gm. and becomes an almost invariable consequence if it is less than 10 μgm./gm.

Ewes receiving high levels of both sulphate and molybdenum in the diet (group 2) retained rather more copper in their livers (mean : 27·2 μgm./gm.) than the ewes of group 1, but were markedly inferior in physical condition and showed the characteristic loss of 'crimp' in wool associated with physiological copper-deficiency[4]. Allcroft and Lewis[5] noted a similar effect on liver-copper storage in the pregnant ewe from feeding molybdenum at 50 mgm./day. Analyses of lamb livers at the end of our experiment suggest that transfer of copper to the lamb was restricted by feeding molybdenum. Insufficient information is available to determine whether this is a result of diminished transfer to the fœtus or the result of decreased transfer during the suckling period ; but it is noteworthy that others[5] have failed to find any influence of feeding large quantities of molybdenum to the ewe on levels of copper in the liver of the new-born lamb.

The lambs in group 2 showing ataxia and degenerative changes in nervous tissue all had extremely low liver-copper values (mean : 3·3 μgm./gm.) and the only lamb in this group not so affected had an unaccountably high content of copper in its liver.

So far as we are aware, this experiment represents the first successful attempt to induce demyelination in the lamb by dietary treatment. Few details have as yet been published of previous attempts of other workers to induce this condition by feeding diets low in copper, but a survey of published results presenting liver-copper analyses from lambs suffering from 'swayback' or 'enzootic ataxia' under field-conditions[1,2,6–9] suggests that clinical symptoms and associated degenerative changes in the central nervous system may occur when the liver-copper of the lamb falls below about 20 μgm./gm. dry matter. It remains to be determined whether the absence of ataxia in the lambs of group 1, despite their very low levels of liver-copper, is due to the fact that no known metabolic antagonist of copper was present in the diet in quantity to impede the utilization of these small stores. Without postulating the existence of such a restrictive agent in some diets, it is difficult to understand why ataxia can occur under field-conditions at concentrations of liver-copper considerably higher than those found necessary in the present investigation.

EFFECT OF STREPTOMYCIN ON *ESCHERICHIA COLI*

By STAFF OF THE DEPARTMENT OF BACTERIOLOGY AND IMMUNOLOGY
Harvard Medical School

Damage by Streptomycin to the Cell Membrane of *Escherichia coli*

It has been shown in this laboratory that streptomycin causes a sensitive strain (but not a streptomycin-resistant strain) of *Escherichia coli* to excrete certain 5′-ribonucleotides at a relatively high rate[1]. It seemed possible that this effect might be due to interference with nucleic acid formation, resulting in an increase in the intracellular pool of free nucleotides. However, nucleotides (or their derivatives) exert a feedback effect on their own biosynthesis, as shown by the fact that an excess of the purine or the pyrimidine required by certain mutants inhibits accumulation of precursors[2]. If these feedback mechanisms effectively regulate nucleotide biosynthesis, a simple block in nucleic acid formation would not be expected to cause an increase in intracellular nucleotide levels. Alternatively, nucleotide excretion might be due to a breakdown of the permeability barrier that normally retains these compounds within the cell. This mechanism would not require elevation of the intracellular levels.

In order to distinguish between these two mechanisms, the levels of nucleotides have been compared in the intracellular pool and in the external medium during exposure to streptomycin. The comparison has also been extended to amino-acids.

For these studies streptomycin (60 μgm./ml.) was added to an aerobic culture of *E. coli* strain *W* growing exponentially in mineral-glucose medium[3] at about 4 × 10[8] cells/ml. Under these conditions the lethal action of streptomycin becomes rapid after a delay of 5–10 min. Cells were harvested after 20 min., when nucleotide excretion was just beginning, and after 45 min., which corresponds to roughly half-maximal excretion. The culture filtrate was harvested after 60 min., when excretion was approaching completion.

Table 1 presents the values, averaged from 4 experiments, for those nucleotides that are excreted heavily. It is seen that after 20 min. of streptomycin treatment the intracellular levels were essentially unchanged, except for an unexplained rise in uridine monophosphate. (There was also a rise in a minor unidentified diphosphate.) At 45 min., when excretion was well under way, all the nucleotides showed a decrease, rather than a rise, in intracellular level, thus pointing to loss of integrity of a permeability barrier. The effect on nucleotide excretion was irreversible, persisting in cells transferred to streptomycin-free medium.

The various mononucleotides showed rather similar extracellular concentrations after streptomycin treatment, despite appreciable differences in their intracel-

Nucleotides were isolated from the culture filtrate by adsorption on charcoal and elution by alcoholic ammonia, and from the cells by treatment with 5 per cent trichloracetic acid, which was then removed by extraction with ether. The individual nucleotides were separated on a column of 'Dowex 1-x8' formate by elution with a linear gradient of 5 *N* formic acid, followed by a gradient of 0·8 *M* ammonium formate in 5 *N* formic acid. Concentrations were estimated spectrophotometrically.

* The concentrations per ml. of intracellular water are about 1,500 times the intracellular values reported here per ml. of culture. The excretion thus represents leakage down a steep concentration gradient.

† The extracellular nucleotide concentrations in untreated cultures were too low to be measured.

SM, streptomycin.

lular concentrations. Larger compounds (diphosphopyridine nucleotide, adenosine diphosphate and adenosine triphosphate) were also excreted, but in smaller proportion to the intracellular concentration. It is seen that the adenosine monophosphate excreted in 60 min. amounted to about 12 times the initial intracellular content. This finding fits the isotopic evidence[1] that the bulk of the excreted nucleotide is synthesized *de novo* during streptomycin treatment.

Since amino-acids also form a substantial intracellular pool, any general loss of integrity of the cell membrane should increase their excretion as well. Indeed, though amino-acids, in contrast to nucleotides, were found to be excreted appreciably even by normal cells (cf. ref. 4), streptomycin treatment for 50 min. caused a four-fold increase in their excretion. This treatment also caused an even greater drop in intracellular levels of amino-acids than had been observed for nucleotides.

Further evidence on the nature of streptomycin action was provided by the observation that its addition to a growing culture progressively destroyed the capacity of the cells to concentrate valine labelled with carbon-14. This treatment also increased the metabolism of added labelled citrate by the cells, which were initially relatively impermeable to this compound. On the basis of all the above findings, it is concluded that streptomycin damages the permeability barrier to small molecules.

Attention has also been given to the conditions required for streptomycin action. Chloramphenicol, which blocks protein synthesis[5], has been found to block the action of streptomycin. With streptomycin alone, under the conditions described above, net formation of protein halted after about 15 min., with an increment of 10–15 per cent; formation of ribo- and deoxyribo-nucleic acid persisted longer and reached increments of 40 and 55 per cent, respectively. With chloramphenicol (20 μgm./ml.) plus streptomycin, as with chloramphenicol alone[5], no protein synthesis was detectable, while ribonucleic acid increased by 70 per cent. Furthermore, chloramphenicol completely blocked both the bactericidal action of streptomycin and its effect on nucleotide excretion. Similar protection against these last two actions had also been obtained by depriving certain auxotrophic mutants of the required amino-acid or pyrimidine (Davis, B. D., and Roth, H., unpublished observations). These results indicate that a certain amount of protein synthesis is required for streptomycin action. They also show that the effects of streptomycin on metabolite excretion and on viability are not due simply to cessation of growth, or to the unbalanced formation of nucleic acid without protein.

It is clear that streptomycin, under appropriate conditions, alters a permeability barrier. Since this effect increases the outward permeability to nucleotides and to amino-acids, and the inward permeability to citrate and (following communication) to streptomycin itself, it seems reasonable to infer that the permeability barrier involved is the cell membrane. This action of streptomycin is reminiscent of that of detergents[6] and polymyxin[7], the attack of which on the membrane also results in metabolite excretion and cell death. However, the facts reported above imply that streptomycin does not directly damage the existing membrane, but rather causes defects in membrane formed in its presence by streptomycin-sensitive cells. The action of streptomycin on membrane formation is thus analogous to that of penicillin on bacterial wall formation[8]. The following communication discusses the significance of this action for the bactericidal effect of streptomycin.

Uptake of Streptomycin by *Escherichia coli*

THE present communication will attempt to relate the findings of the previous communication to the kinetics and the sites of streptomycin uptake by the cells.

For this purpose streptomycin labelled with carbon-14 was added to a growing culture. 1-ml. samples were taken at intervals and the cells were recovered on a 'Millipore' filter and washed with 3 × 5 ml. of water to remove the extracellular fluid. Further washing removed no radioactivity. In contrast, washing with buffer removed 99 per cent of the radioactivity from early samples and 94 per cent from late samples, indicating that most of the streptomycin, even after it had killed the cells, was held by ionic linkage.

Results of a typical experiment are presented in curve *SM* of Fig. 1. The initial uptake of streptomycin was extremely rapid, being essentially complete by the time the first sample could be taken and filtered (about 1 min.). During the next 15 min. the cell content remained constant. There was then a secondary rise, levelling off after an hour at a three- to four-fold increase. This rise began at about the time (previous communication) when excretion of

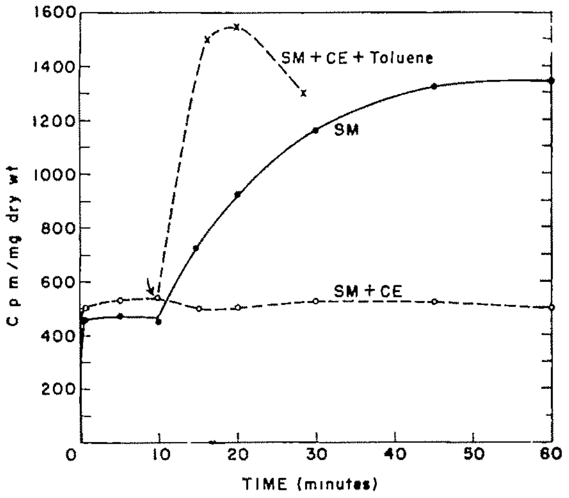

Fig. 1. Uptake of streptomycin labelled with carbon-14. 40 μgm./ml. of labelled streptomycin (formed from uniformly labelled glucose) was added to an exponentially growing shaking culture in minimal medium, and to two similar cultures (labelled *CE*) to which chloramphenicol (20 μgm./ml.) had been added 2 min. earlier. At the time indicated by the arrow, one *CE* culture received 0·02 ml. of toluene per ml. of culture

intracellular metabolites began and protein synthesis ceased.

We initially attempted to explain these observations on the basis of the assumption that the cell is freely permeable to streptomycin. Part of the initial uptake would then occur at intracellular sites where streptomycin would interfere with normal protein (cf. ref. 1) and nucleic acid synthesis. Resulting defective formation of protein and perhaps other membrane constituents could explain the observed damage to the permeability barrier of the cell.

The kinetics of uptake of streptomycin, however, is difficult to interpret on this basis. Not only is a plateau reached with streptomycin much more rapidly than has been observed with many added substances which are known to penetrate (for example, amino-acids), but at 0° the initial uptake was found to be as high as at 37°, and was still too rapid to follow. Furthermore, the observation of a secondary uptake would require the postulate, in a freely permeable cell, of the formation of added receptors for streptomycin. Since streptomycin complexes readily with free nucleic acids *in vitro*[2], it seemed possible that these receptors might be the excess ribo- and deoxyribo-nucleic acids which are formed in the presence of streptomycin after protein formation ceases (see previous communication). However, though the addition of chloramphenicol, in the presence of streptomycin, causes an even more pronounced synthesis of excess nucleic acids (previous communication), this addition completely prevented the secondary uptake of streptomycin (curve *SM* + *CE* of Fig. 1). It would therefore be necessary to postulate the formation of other, unknown receptors, in a quantity several times that initially available, and this explanation of the secondary uptake seems rather improbable.

Alternatively, it seemed possible that the cell might be impermeable to streptomycin, the rapid initial attachment of which would then be restricted to the cell wall and the external surface of the cell membrane. Some of its attachments on the latter locus would be responsible for the observed formation of defective membrane. This membrane damage would then permit entry of streptomycin into the cell, where it would be bound by nucleic acids[2] and possibly other anionic constituents. The block in protein synthesis, and later in nucleic acid synthesis, would follow the entry of streptomycin into the cell.

To distinguish between these two mechanisms, observations were made on the response of streptomycin uptake to known damage to the membrane. In an experiment with cells the uptake of which was being held at the initial level by the presence of chloramphenicol, the addition of toluene resulted in a large and rapid further uptake (Fig. 1). In other experiments cells were treated with toluene before exposure to streptomycin. This procedure resulted in a several-fold increase in the initial uptake; and similar treatment with polymyxin *B* (cf. ref. 3) had an even greater effect.

These observations indicate that during action of streptomycin its initial uptake, at least within measurable limits, occurs only outside the cell membrane, and the secondary uptake depends on subsequent damage to the membrane. It therefore appears likely that the growing membrane, known to be damaged by streptomycin, is the primary site of action of the drug. It has not yet been possible to determine whether the damage to the membrane is a sufficient as well as a necessary cause of the bactericidal effect of streptomycin, or whether this effect depends on penetration of the drug.

A resistant mutant exhibited the same initial uptake of streptomycin as its sensitive parent, but no secondary uptake. It therefore appears that in this case resistance depends on an alteration in the membrane-forming apparatus such as to prevent streptomycin from damaging the membrane. This mechanism of resistance would explain the observation that in a diploid strain of *E. coli* streptomycin sensitivity is dominant to resistance[4]. The membrane in such a cell would presumably contain both sensitive and resistant sites, and streptomycin action on the sensitive sites would have the same consequences as in a fully sensitive cell.

The mechanism of streptomycin action proposed here provides an explanation for the well-known and puzzling synergism observed between streptomycin and other bactericidal agents. A drug that damages the permeability barrier of a cell would promote the entry of other drugs.

This work will be published in detail. It has been supported by Grants *E*-2012 of the U.S. Public Health Service and *G*-9078 of the National Science Foundation. We are grateful to Merck Sharp and Dohme for a generous gift of radioactive streptomycin, and to Miss Elizabeth Vollmayer for excellent technical assistance.

Some early experiments were performed by two of us (A. K. A. and B. D. D.) at the Department of Pharmacology, New York University College of Medicine.

COMMERCIAL APPLICATION OF GIBBERELLIC ACID TO HOPS

By A. S. NASH and P. D. MULLANEY

Carlton and United Breweries, Melbourne

THE effect of gibberellic acid as a growth-promoting substance caused attention to be focused upon it, when a great disadvantage of newly bred triploid hop plants became apparent. The triploid material, being partly sterile, tended to hang in the burr stage for a long period, and it was considered that gibberellic acid could perhaps force the triploids from the burr stage, besides giving an economic increase in yield.

To implement such a hypothesis, preliminary applications of gibberellic acid were carried out to determine the optimal time of application. For these determinations, the potassium salt of gibberellic acid under the trade name 'Gibrel' was used. Laterals at different stages of burr development on different plants of the triploid material, known as 12/5/28, were completely covered in a plastic bag and sprayed by a Rega continuous-spray unit with the 'Gibrel' solution of concentration 50 parts per million. These preliminary sprays showed that the time of application could reasonably be narrowed down to when the stigmas of the female flowers were ⅛ in. or greater in length. Earlier application of the spray resulted in excessive elongation of the sub-laterals (this was of the order of 100 per cent in comparison with the control laterals) and later application showed a decrease in overall effect.

Once the time of application had been suitably determined, a further trial with different strengths of application was attempted. Concentrations of 50, 25, 12·5, 6·25 and 0·625 parts per million (p.p.m.) respectively were used, with applications carried out exactly as above on laterals of different plants with individual cone weights for each treatment being recorded. These were compared to the cone weights from similar laterals from unsprayed vines used as controls. The gibberellic acid-sprayed material showed typical reactions[1]. The leaves became paler within 4 days; this, however, was only temporary and after a further 6 days the leaves had regained their normal colour. The sprayed material showed normal development of the cones, with no abnormal growth of the sub-laterals, and was approximately 10 days in advance in maturity on the unsprayed control material. Not only was the maturity of the cones pushed forward, but also the cones along the sprayed laterals were more even in development, so that the harvest time became more critical, with practically all cones at the same stage of maturity at the same time. However, those cones developed from gibberellic acid-sprayed burr were more subject to wind burn than the controls and the degree of burn was approximately the same for all concentrations. The most significant part of the growth of the gibberellic acid material was the great initial surge of development, which although slowing down with time, was still sufficient to ripen the cones 10 days before the control cones. The actual cone weights are set out in Table 1.

Table 1

Concentration of spray (p.p.m.)	No. of cones in treatment	Weight/cone (gm.)
0·625	164	0·82
6·25	212	0·85
12·5	225	1·10
25·0	148	1·40
50·0	151	1·44
Control	594	0·77

It was decided that the concentration of gibberellic acid at 12·5 p.p.m. would give the desired effect of increase in yield and decrease in maturity time, without being too expensive for an equitable return.

Since most commercial growers of hops are equipped with overhead sprays, a full plant trial was adopted whereby the gibberellic acid applied at 12·5 p.p.m. would be sprayed from above the plant by means of a fine nozzle shower-head. The variety used was a locally bred, high analysis hop called Pride of Ringwood. The shower-head was connected to a carbon dioxide cylinder with an apparent head pressure of 30 lb./sq in., but due to the friction loss along the long, small diameter hose necessary to reach the tall crop, the actual spray was delivered at somewhat less than 30 lb./sq. in.; however, excellent coverage of the plants was effected due to the fine spray achieved. The time of application was allowed to progress a little past the optimal time to make sure that most of the burr was at a receptive stage. The average yield per sprayed hill was 7·25 lb. while the average yield for the control hills was 5·20 lb. This gave an average increase of 2·05 lb./hill—a large increase when considered in terms of 850 hills/acre. On yield results alone, the application of gibberellic acid seemed justifiable, since the yields were increased and the decreased time of maturity would allow for a less restrictive harvest period. The main interest in bought hops is the percentage of α resin in the purchased product. The two lots of material, treated with gibberellic acid and controls, were analysed for α-resin content by the Verzele rapid polarimetric method[2], and further tests for total soft resin content were carried out by the Walker–Hastings method[3].

Table 2

	α-Resin (per cent)	Total soft resin (per cent)
Treated hops	1·8	9·7
Untreated hops	10·16	21·8

Table 2 shows that the most important substance in the hops from the brewer's point of view has been greatly decreased by application of gibberellic acid. Further work on estimation of oils by gas chromatography was carried out and appears to indicate that here again there is a difference in percentages of the various oil components between gibberellic acid-treated and normal hops; however, this work is inconclusive and requires verification.

LETTERS TO THE EDITORS

PHYSICS

Growth of the Tritium Content of Atmospheric Molecular Hydrogen

A SERIES of measurements of the abundance of tritium in atmospheric molecular hydrogen, covering the period 1956–58, were carried out by Gonsior in Germany[1]. These measurements were interpreted by him as showing that over that period the abundance was increasing linearly by 5 × 10^4 T.U. a year commencing with the 'Castle' series of thermonuclear weapon tests in the spring of 1954. (1 T.U. is equivalent to 1 tritium atom in 10^{18} hydrogen atoms.)

We, too, believe that the growth must be due to atomic energy operations; but in our view Gonsior has taken insufficient account of abundances reported directly or otherwise at least four times prior to the end of 1958:

(*a*) Faltings and Harteck[2-5] measured the tritium abundance in hydrogen from Hamburg air collected in 1948–49. They quoted the abundance as being $0{\cdot}38 \pm 0{\cdot}125 \times 10^4$ T.U.

(*b*) Grosse, Kirshenbaum, Kulp and Broecker[6] reported $1{\cdot}66 \pm 0{\cdot}097 \times 10^4$ T.U., having examined air collected at Buffalo, N.Y., in the spring of 1952.

(*c*) Begemann[7] stated that about 1 per cent of the world inventory of natural tritium was present in gaseous hydrogen during the spring of 1954. As he believed at the time that natural tritium totalled 1·8 kgm., we may suppose that the abundance in hydrogen was then about $3{\cdot}4 \times 10^4$ T.U. in the United States.

(*d*) Craig[8] reported that a dozen samples of air examined by Begemann had abundances ranging from 5 to 10 × 10^4 T.U., averaging about 8 × 10^4 T.U. These determinations were described as 'recent' in November 1956[9]. The origin of the samples was not stated.

These results, together with those of Gonsior, are presented in Fig. 1, the ordinate scale of which is logarithmic. As can be seen, the data, with the possible exception of Gonsior's first Nuremberg result, are consistent with an abundance of tritium in northern hemisphere tropospheric hydrogen which was increasing not only before 1954 but also before the first reported detonation of any 'hydrogen device', in October–November 1952. It furthermore appeared to us that the abundance could be empirically represented as increasing exponentially with a doubling time of 18 months, as is shown by the line drawn through the experimental points in Fig. 1.

In order to establish whether the tritium abundance was continuing to increase in the manner suggested, we measured the tritium activity in mixtures of atmospheric hydrogen and neon collected at the end of 1958 and in the summer of 1959, the gas mixtures being extracted from the helium–hydrogen–neon fraction that arises in commercial liquid air distillation by fractional desorption from charcoal. We have no reason to suppose that isotopic fractionation of tritium from hydrogen occurs either in the distillation or in the desorption process. The hydrogen–neon mixtures each came from several distillation plants situated in the United Kingdom, and each sample represented an averaging period of two or three weeks. The mixtures were counted in a Geiger–Muller counter using di-ethyl ether as a quenching agent, the percentage of hydrogen in the mixture being first determined by mass-spectrometric means. For air over the United Kingdom we deduced tritium/hydrogen = $38{\cdot}1 \pm 1 \times 10^4$ T.U. (November–December 1958) and $36{\cdot}5 \pm 1 \times 10^4$ T.U. (December 1958). The following summer, measurement showed tritium/hydrogen = $48{\cdot}6 \pm 1{\cdot}5 \times 10^4$ T.U. (July–August 1959). The errors quoted are in each case those arising from uncertainty in the volume of gas counted together with the statistical counting error. These results are shown in Fig. 1, the growth-rate for the first half of 1959 being 18 × 10^4 T.U. per year (mean), three and a half times the mean rate measured earlier by Gonsior.

We have shown, therefore, that the abundance of tritium in atmospheric hydrogen is still increasing in a manner not inconsistent with an 18-month doubling time, but are unable to advance any satis-

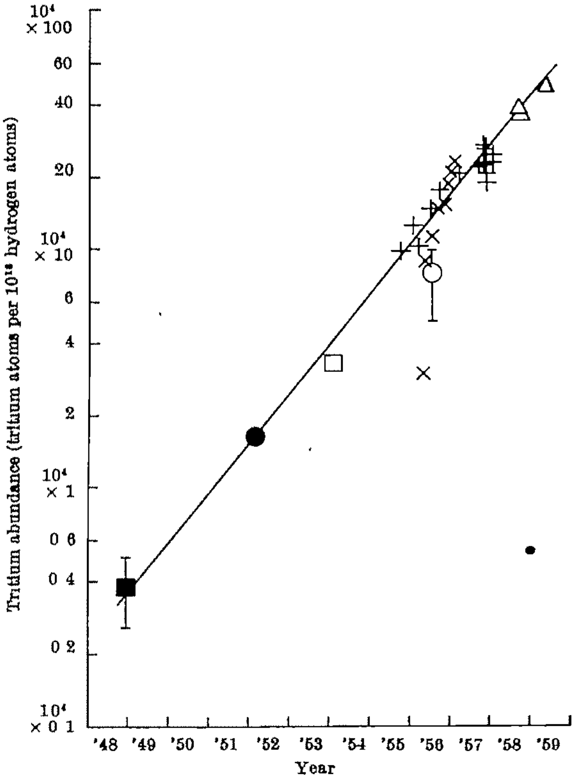

Fig. 1 Increase of tritium in the northern hemisphere atmospheric hydrogen during the last decade. ■, Faltings and Harteck; ●, Grosse *et al.*; □, Begemann; ○, Begemann (Craig); +, Gonsior–Hamburg; ×, Gonsior–Nuremberg; △, own measurements

factory explanation of this phenomenon, which could well be fortuitous, depending on the extent to which weapons trials held prior to October 1952 released tritium to the atmosphere, and on the extent to which artificial tritium escapes to the atmosphere in the course of its production. Were this tritium to be distributed uniformly throughout the hydrogen of the atmosphere, a matter which we doubt, then the world integral of tritium in this form would be about 2 megacuries, that is, about 200 gm., at the present time. Whatever factors one allows for non-uniform distribution in the atmosphere the integral is still probably much less than the hundreds of megacuries of artificial tritium that we know to be present in the water bodies of the Earth[10,11].

We are grateful to Mr. B. Bann of British Oxygen Gases, Ltd., Wembley, Middlesex, for supplying us with the gas samples and to Mr. J. Pennington of the same Company for having separated them from their associated helium.

Horizontal Drifts in the *E*-Region at Waltair

A CONSIDERABLE amount of work has been done on the study of horizontal drifts in the *E*-layer at high-latitude stations, the results of which were summarized by Briggs and Spencer[1]. As there is practically no work done on this aspect at low-latitude stations, systematic measurements of *E*-region drifts were undertaken at Waltair (geogr. lat. 17° 43′ N., geo.-mag. lat. 7·4°) from the beginning of the International Geophysical Year.

The results presented here are based on the analysis of data obtained at Waltair for two years, June 1957–May 1959. The similar fades method of Mitra was used with a slightly modified technique of recording[2]. Measurements were made on a frequency of 2·5 Mc./sec. for all the 24 hr., drift records using the reflexions from E_s only being considered during night-time. Observations were taken at hourly intervals on all the world days and, in addition, measurements were made on at least three more days in each month so that the data were available for at least six days in each month. The drift speed and direction are calculated by the similar fades method. Following the usual practice, the north–south and east–west components of the observations taken during each month and season are plotted separately and mean curves drawn through the points as judged by the eye. These curves were subjected to harmonic analysis to obtain steady 24-hr. and 12-hr. components. In this communication, only the results of harmonic analysis of the data for the four seasons taken during the two years are presented Table 1 gives the results of the harmonic analyses thus obtained.

Table 1

Summer	1957	N.–S.	$-37\cdot7 + 9\cdot0 \sin(t+291^\circ) + 30\cdot0 \sin(2t+110^\circ)$

		E.–W.	$+5\cdot4 + 99\cdot0 \sin(t+39^\circ) + 2\cdot4 \sin(2t+352^\circ)$
Winter	1957–1958	N.–S.	$-12\cdot9 + 45\cdot0 \sin(t+85^\circ) + 32\cdot0 \sin(2t+40^\circ)$
		E.–W.	$+4\cdot0 + 76\cdot0 \sin(t+41^\circ) + 15\cdot5 \sin(2t+346^\circ)$
Winter	1958–1959	N.–S.	$-7\cdot0 + 42\cdot0 \sin(t+92^\circ) + 30\cdot0 \sin(2t+41^\circ)$
		E.–W.	$+3\cdot2 + 78\cdot0 \sin(t+42^\circ) + 21\cdot3 \sin(2t+346^\circ)$
Spring	1958	N.–S.	$-20\cdot1 + 30\cdot5 \sin(t+136^\circ) + 41\cdot0 \sin(2t+60^\circ)$
		E.–W.	$+1\cdot1 + 71\cdot0 \sin(t+57^\circ) + 22\cdot0 \sin(2t+344^\circ)$
Spring	1959	N.–S.	$-24\cdot0 + 42\cdot0 \sin(t+99^\circ) + 18\cdot8 \sin(2t+84^\circ)$
		E.–W.	$+8\cdot2 + 78\cdot5 \sin(t+42^\circ) + 11\cdot6 \sin(2t+1^\circ)$

Typical curves showing the diurnal variation of the north–south and east–west components for the summer and winter seasons of 1958–59 are shown in Fig. 1.

The main features of the *E*-region drifts at Waltair may be summarized as follows. The 24-hourly component is the predominant periodic component of the drift vector, while the steady and 12-hourly components are nearly of the same order of magnitude. The direction of the steady component, which is generally towards south or south–south-east, does not show any systematic change from season to season, while the magnitude shows a seasonal variation with a minimum in winter and a maximum in summer. The amplitude of the 24-hr. periodic north–south component is always less than the east–west component, while the 12-hourly periodic north–south component is always higher than the east–west component, the difference being particularly marked in summer and autumn seasons. The phase difference between north–south and east–west components is such that the drift vector rotates clockwise in all seasons for the 12-hourly periodic component and also for the 24-hourly periodic component except the summer season for which an anti-clockwise sense of rotation is definitely observed. The phase difference between north–south and east–west components of 24-hourly and 12-hourly periodic components varies in a systematic manner from season to season. In summer and autumn seasons the polar plots of the drift vector give highly elongated ellipses the major axes of which lie along east–west and north–south directions for the 24-hourly and

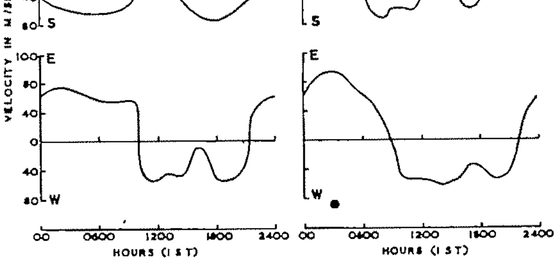

Fig. 1

12-hourly periodic components respectively. It can be seen from Table 1 that there is no radical change in the *E*-region drifts at Waltair for the two years.

Comparing these results with those obtained at some high-latitude stations, it may be noted that there are some points of disagreement. Unlike the results of drift measurements at high latitudes, where the 12-hourly component is found to be predominant, results from Waltair reveal a prominent 24-hourly component. The 24-hourly east–west component is directed towards east during a major part of the night and west during most of the daylight hours at this low-latitude station, while the behaviour is opposite for the high-latitude stations like Cambridge[1] and Kjeller[3]. The observation of an anti-clockwise sense of rotation of the 24-hourly drift vector for the northern hemisphere station is unusual and requires confirmation from data obtained at other low-latitude north and south hemisphere stations.

The 12-hourly north–south component shows maximum northward drift at 0300 and 1500 hr. at high-latitude stations while this occurs at 0000 and 1200 hr. local time at Waltair.

Recently, Skinner, Hope and Wright[4], while reporting results of drift measurements from Ibadan (geogr. lat. 07° 26′ N., geogr. long. 03° 53′ E.; geomag. 10·6° N.), have reproduced the curve of east–west component of *E*-region drifts during day-time, which shows features similar to our day-time curves for the east–west component. They have not observed any significant north–south component although their geomagnetic latitude is nearer to ours. The reason for the lack of north–south component at Ibadan is presumably due to the fact that the magnetic field at that station is nearly horizontal, the magnetic latitude being 2½° S.

A detailed paper embodying the results of this investigation will shortly be published elsewhere. We wish to acknowledge the financial assistance given by the Council of Scientific and Industrial Research for supporting these investigations.

Life-Time of the Atomic Oxygen 6300 A. Line in the Auroral Spectrum

The red auroral lines of atomic oxygen at 6300 A. and 6364 A. are known to appear with a delay against other lines. The lag is due to the fact that the excited oxygen atoms are metastable, the life-time being about 110 sec.[1]. The delay of the oxygen 5577 line is for the same reason 0·75 sec.[2]. For experimental evidence records made by an automatic direct-recording spectrograph have been used and the variation of the red line due to changes in the luminosity of the aurora is compared with that of the N_2^+ band 4278 A. The green line 5577 A. may also be used; but on the spectral records this line was too often outside the record, because of over-loading of the amplifier.

Some examples of the records showing a sudden rise of the spectral intensity have been selected, and curves for both lines investigated are drawn with the same amplitude in order to measure the time difference at different moments. Fig. 1 shows three typical examples. The values of the delay are mean values received by measuring the time difference at a number of points for the rising part and the falling part of the curve respectively. Only examples with sufficiently close amplitude variations are used.

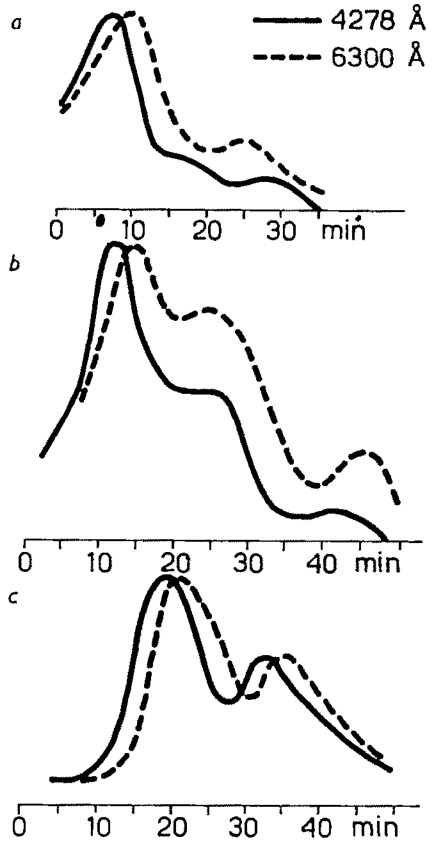

Fig. 1

The resulting mean value of 12 cases is $t_r = 110$ sec. for the rising part and $t_f = 175$ sec. for the falling part of the curve. These values may be regarded as approximate, for intensity variations of the aurora between each record and movements of the aurora will introduce some error. Further, the difference in height level of the excitation of both lines may influence the result. Nevertheless, it seems that the delay at the beginning of the emission of the red line is in accordance with the theoretical value but that the delay is greater when the emission decreases. The theoretical value of 110 sec. is a mean value of a large number of single processes and a slower fall of the curve is therefore quite reasonable.

Table 1

Curve No.	t_r	t
1	99	168
2	102	195
3	105	222
4	115	109
5	120	180
6	127	330
7	53	135
8	75	180
9	135	120
10	135	135
11	135	160
12	135	—
Mean values	$t_r = 110$ sec.	$t_f = 175$ sec.

Table 1 shows the spreading of values of the 12 cases analysed. In all, 36 cases have been investigated and the mean value of the measured delay including both the rising and falling period is ~120 sec.

METALLURGY

Dependence on Temperature of Elastic Moduli of Tin

The crystalline structure of tin changes from cubic (grey tin) to body-centred tetragonal (white tin) at 18° C. These structural changes were examined as reflected in the thermoelastic behaviour of polycrystalline tin.

The composite piezo-electric oscillator method[1] has been employed in the present investigation, the frequency-range being 100–145 kc./sec. Specimen rods of rectangular and cylindrical cross-sections are cut from 99 per cent pure tin. The composite oscillator with its holder is placed at the centre of an electrical furnace and the temperature is controlled by varying the current using a variac. For study in the low-temperature region, the crystal holder sealed in a container is maintained in a Dewar flask containing freezing mixtures.

The observed variations of Young's modulus (Y) and rigidity modulus (G) with temperature are represented graphically in Fig. 1. The elastic moduli decrease linearly with temperature. A sudden change in the gradient of the curves occurs at about 18° C. in both the cases. This transition is due to the structural changes.

In addition to the above transition, the Young's modulus versus temperature curve shows another sudden change in the gradient at 80° C. It is quite possible that this phenomenon is due to the stress relaxation at grain boundaries. It is known that the temperature at which the grain boundary slipping takes place varies with the frequency of excitation.

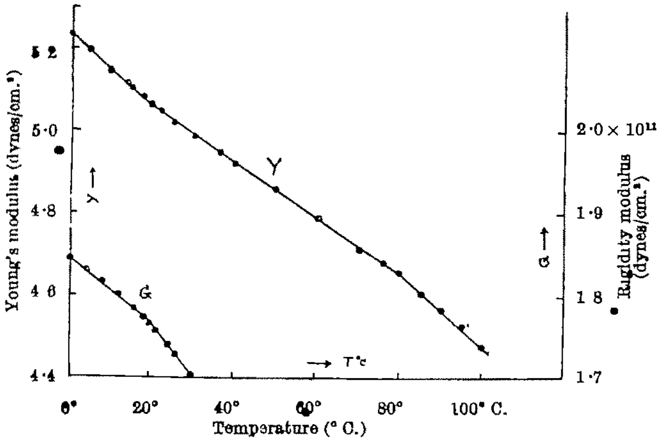

Fig. 1

Experimental investigations to study the thermoelastic behaviour of tin at low frequencies (3–10 kc./s.) are in progress. Such a study enables us to explain the mechanism responsible for the transition occurring at 80° C.

The volume compressibility of cubic tin at 0° C. is calculated making use of the values of the elastic moduli of polycrystalline tin at 0° C. The value works out to be $8{\cdot}31 \times 10^{-13}$ cm.^{2}/dyne.

We thank Dr. J. Bhimasenachar for his guidance and encouragement.

Distortions in Metallic Structures

A puzzling feature of the Periodic Table has been that certain of the elements, such as indium, cadmium and zinc, while possessing typically metallic properties, have structures which are slight distortions of close-packed metallic structures.

Experimental[1] and theoretical[2] work on indium shows that the tetragonal distortions in this metal, and its alloys with various solutes, can be ascribed to a lowering of Fermi energy brought about by the distortion. The energies of the {002} overlaps for the face-centred cubic Brillouin zone are identical, and provided that the total number of electrons in these overlaps is below a certain value, this particular 'degeneracy' can be removed or lowered, with a lowering of Fermi energy, by orthorhombic or tetragonal distortions, at constant volume, of the metal lattice. The energetics of these distortions are similar to those presented by Dunitz and Orgel[3] for the Jahn-Teller distortions which have been so successful in explaining the structures of transition-metal oxides, though without the corresponding bonding and anti-bonding implications.

The energy scheme of Fig. 1*a* will enable this to be readily visualized; the levels shown are those corresponding to the initiation of the overlaps on (002) and (200) for a face-centred cubic structure, and for the tetragonally distorted structures with axial ratios respectively less than and greater than 1. The sequence of phases indicated by this scheme is observed in the systems indium–tin and indium–lead[4], in which the volume differences between the phases are very small.

It should be emphasized that in each structure the continuous energy band of the lower level actually overlaps that of the higher level; calculations (Wood, V. E., private communication) show that some states in the higher-energy overlap may be occupied without greatly affecting the stability conferred on the structure by the Fermi energy. The energy distribution curves in Fig. 1*b* are approximated by rectangles, so that the total energy of the electrons in these overlaps (proportional to the area below the Fermi surface) can be easily visualized. In this scheme, the first structure would become unstable when the band was filled to level A, and the stability of the cubic structure would equal that of the other two at level B.

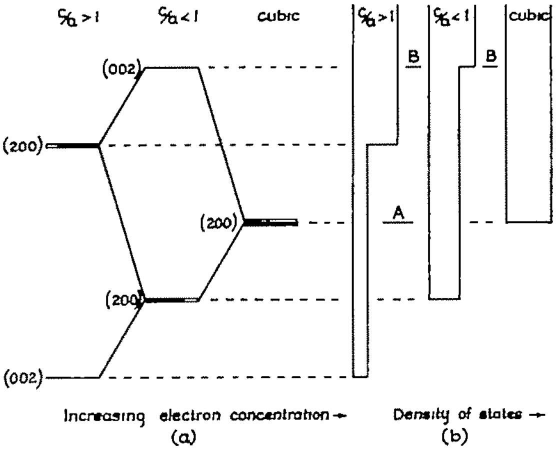

Fig. 1. Energy schemes for {002} Brillouin zone overlaps in metals with face-centred cubic and closely related tetragonal structures

A similar type of electronic stabilization may account for the large axial ratios of the close-packed hexagonal structures of zinc and cadmium, in which the low-multiplicity (0001) overlaps are moved to lower energies by the type of distortion observed.

Wood's calculations[2], based on electrostatic and Fermi energies only, give no indication of the factors which govern the equilibrium axial ratio in the cases considered here, and which prevent such distortions in the typical metallic structures. This may be due to the simplifying approximations made; but in my opinion, the origin of these balancing forces must be sought in the underlying assumptions.

Apart from an entropy effect which would be similar in all cases, there appear to be only two possibilities:

(*a*) In spite of the relatively open nature of the metals concerned, the properties of the ions themselves and/or their exchange interactions may be of importance. Some possible support for this view is given by the observation[5] that even the ion-cores in zinc seem to be distorted by elongation in the direction of the *c*-axis.

(*b*) A partial localization of the electron cloud may modify the full-zone contribution to the lattice energy. This would perhaps correspond to a change in energy due to the distortion of one type of bond in the resonant bond theory of metals.

In contrast to previous theories of the tetragonal structure of indium[6], the present theory easily explains the low-energy transformation to a second tetragonal phase which occurs in the systems indium–lead and indium–tin, and is thus to be preferred.

CHEMISTRY

Electron Spin Resonance of γ-Irradiated, Substituted Toluenes

THE results reported here were obtained during an attempt to study the energy transfer efficiency from low-temperature, rigid glass solvent to dissolved solute molecules on γ-irradiation. This has recently been studied by Porter *et al.*[1], who recorded the ultra-violet absorption spectra of both γ-irradiated and ultra-violet illuminated side-chain substituted aromatic hydrocarbons dissolved in hydrocarbon glasses at 77° K. and, using comparative methods previously reported[2,3], assigned the various spectra to benzyl-type radicals. It was thought that using the electron spin resonance technique instead of ultra-violet spectroscopy, additional information might be obtained; but preliminary experiments soon showed that, while a radical signal characteristic of the solute could be detected, the fine structure of the electron spin resonance spectrum of the glass solvent made quantitative estimations impossible. However, the electron spin resonance spectra of the various radicals produced by γ-irradiation of the pure, degassed, frozen solutes alone were determined.

On first sight all the spectra seemed identical, being broad and featureless with negligible hyperfine splitting (Fig. 1). The signal was checked to be below saturation, and the narrow (about 10 gauss) super pure quartz reaction vessel signal—occasionally observed—was allowed for. However, on closer inspection it was found that the overall width differed significantly from radical to radical. Table 1 compares these results with those of Porter *et al.*[1].

With the exception of $C_6H_5CH_2CH_3$, which received additional irradiation, all the above were exposed and measured under as near as possible identical conditions, using the apparatus and techniques already described[4].

In order to obtain a very rough estimate of the *G*-value of the above radical production, 'cupric-ferrous' dosimetry was used[5] to establish that in 1 hr. the dose received was approximately 0 6 × 10^{18} × 100 eV./gm.; comparison of the signal from a known amount of diphenylpicrylhydrazyl in benzene with the above broad signals indicated that approximately 10^{18} spins/gm.—a lower limit depending on modulation and any (small) saturation effects—were formed after 1-hr. irradiation of all the samples except ethyl benzene and the quartz reaction vessel. The latter gave approximately 10^{15} spins/gm.

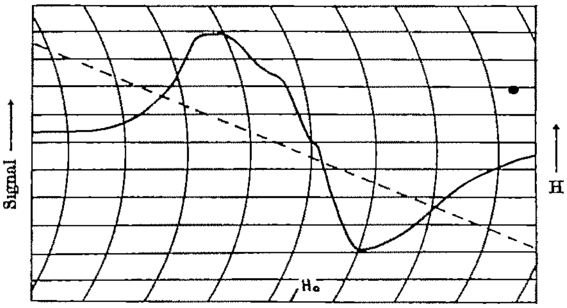

Fig 1. Electron spin resonance from isopropyl benzene after 20 min. γ-irradiation at 77° K. Spread, 34 gauss. Dashed line, magnetic field. Rate versus time

Table 1. ELECTRON SPIN RESONANCE OF SUBSTITUTED TOLUENES

Compound	Radical (see ref. 1) γ	Radical (see ref. 1) Ultra-violet	Electron spin resonance observed (and γ-irradiation time)
$C_6H_5.CH_3$	$C_6H_5.CH_2$	$C_6H_5.CH_2$	Broad, 46 gauss spread (1 hr.)
$C_6H_5.CH_2Cl$	$C_6H_5.CHCl$	$C_6H_5.CH_2$	,, 32 gauss (½ hr.) + 46 gauss (1 hr.)
$C_6H_5.CHCl_2$	$C_6H_5.CCl_2$	$C_6H_5.CHCl$	,, 66 gauss (1 hr.)
$C_6H_5.CCl_3$	$C_6H_5.CCl_2$	$C_6H_5.CCl_2$	,, 66 gauss (1 (hr)
$C_6H_5.CH_2CH_3$	$C_6H_5.CHCH_3$	$C_6H_5.CHCH_3$	,, (~80 gauss)—very weak (3 hr.)
$C_6H_5.C(CH_3)_3$	$C_6H_5.C(CH_3)_2$	$C_6H_5.C(CH_3)_2$	,, 32 gauss (20 min.)
$C_6H_5.CH(CH_3)_2$	$C_6H_5.C(CH_3)_2$	$C_6H_5.C(CH_3)_2$	,, 34 gauss (20 min.)

From the above minimum a value of $G \simeq 1{\cdot}6$ was obtained.

Inspection of Table 1 shows that there is a correlation between the electron spin resonance line spread in gauss and the radicals detected by Porter *et al.* by ultra-violet spectroscopy. In three cases in Table 1, Porter *et al.* found that two different compounds gave the same radical under suitable conditions. For these three cases the electron spin resonance of the pure γ-irradiated compounds has the same line-width. For benzyl chloride it can be seen that there are two species produced; this is also in agreement with the observations of Chilton and Porter[1] that a small amount of benzyl radical is formed in addition to the C_6H_5CHCl radical. However, though one can speculate as to the nature of the radicals responsible for the electron spin resonance, without fine structure no definite conclusions can be drawn.

I am greatly indebted to Dr. M. S. Matheson for helpful discussions, to Dr. B. Smaller for the loan of his apparatus and helpful discussions, to Mr. W. Mulac, who carried out the irradiations, and to Dr. E. Strachan for supplying purified samples.

Phosphides of the Platinum Metals

THE existence of several phosphides of the platinum metals has been reported by Biltz *et al.*[1]. The knowledge of the physical and chemical properties of these phases is, however, very meagre. Crystal structures have been determined for only three phosphides, namely, Rh_2P and Ir_2P with the anti-fluorite structure[2] and PtP_2 with the pyrite structure[3].

I have started an X-ray powder and single-crystal investigation of phosphides of the platinum metals in order to establish the compositions of the phases and to determine the crystal structures. A preliminary report of the work is given below.

The phosphides have been prepared by heating metal powder (purity 99·5 per cent or higher) and red phosphorus in sealed and evacuated silica tubes at temperatures between 500° and 1,100° C. No appreciable attack on the silica tubes has been observed. Powder photographs of the reaction products have been taken with Guinier-type focusing cameras in copper $K\alpha$ radiation. Calcium fluoride ($a = 5{\cdot}4630$ A.) has been used as internal calibration standard on each powder photograph, and the accuracy of the lattice parameter determinations is estimated to be higher than 0·05 per cent.

From a survey of the X-ray powder data, the unit cell dimensions and crystal structure types of the phases Ru_2P, RuP, RuP_2, OsP_2, RhP_3, PdP_3 and IrP_3 have been determined. The earlier structure determinations of Rh_2P, Ir_2P and PtP_2 have been confirmed, and the unit cell dimensions have been redetermined. Crystallographic data for the above-mentioned phases are given in Table 1.

Table 1. CRYSTALLOGRAPHIC DATA OF SOME PLATINUM METAL PHOSPHIDES

Phosphide	Structure type	Space group	*a*	*b*	*c*
Ru_2P	*C*23 (anti-$PbCl_2$)	*Pnma* (*Pmnb*	5·902 3·859	3·859 5·902	6·896 6·896)
RuP	*B*31 (MnP)	*Pnma* (*Pbnm*	5·520 6·120	3·168 5·520	6·120 3·168)
RuP_2	*C*18 (marcasite)	*Pnnm* (*Pmnn*	5·115 2·870	5·888 5·115	2·870 5·888)
OsP_2	*C*18 (marcasite)	*Pnnm* (*Pmnn*	5·098 2·918	5·898 5·098	2·918 5·898)
Rh_2P	*C*1 (anti-fluorite)	*Fm*3*m*	5·498	—	—
Ir_2P	*C*1 (anti-fluorite)	*Fm*3*m*	5·543	—	—
RhP_3	*D*2 (skutterudite)	*Im*3	7·996	—	—
PdP_3	*D*2 (skutterudite)	*Im*3	7·705	—	—
IrP_3	*D*2 (skutterudite)	*Im*3	8·015	—	—
PtP_2	*C*2 (pyrite)	*Pa*3	5·694	—	—

The standard setting of the unit cells in "International Tables for X-ray Crystallography", 1 (1952) has been adopted. The settings of the unit cells according to the descriptions of the *C*23, *B*31 and *C*18 types in "Strukturbericht" are given in parenthesis. The unit cell dimensions are given in angstrom units.

The structural similarities with the phosphides of the iron group metals may be noted. Co_2P[4] is *iso*structural with Ru_2P, FeP[5] and CoP[5] are *iso*structural with RuP, FeP_2[6] is *iso*structural with RuP_2 and OsP_2, CoP_3[7] and NiP_3[7] are *iso*structural with RhP_3, PdP_3 and IrP_3. It may further be mentioned that the powder photographs of RhP_2 and IrP_2 show a very close resemblance, and it is thus highly probable that RhP_2 and IrP_2 are *iso*structural.

The crystal structure investigations of the remaining phosphides of the platinum metals will mainly be performed with single-crystal methods. Detailed reports of this work will be published later (*Acta Chem. Scand.*).

This investigation was made during the tenure of a generous scholarship from the Statens Tekniska Forskningsråd. The work has been supported in part by the Air Force Office of Scientific Research of the Air Research and Development Command, United States Air Force, through its European Office under contract No. *AF* 61(052)-40. I wish to thank Prof. G. Hagg for his kind interest.

Zone of Negative Temperature Coefficient in Hydrocarbon Oxidation

THE occurrence of a zone of negative temperature coefficient is a feature almost unique to hydrocarbon oxidation. It is most intriguing how the rate and extent of reaction, which at first increase rapidly with temperature and give rise to cool flames, begin to fall with further rise in temperature. Although, justifiably, there has been a great deal of speculation about the factors responsible for this zone, very little experimental work seems to have been done to explore it.

We have recently investigated the zone of negative temperature coefficient of a number of hydrocarbons. The effect of various additives, which represent different categories of reaction intermediates, such as peroxides, aldehydes, ketones, alcohols and olefins, has also been examined. The experimental conditions used were similar to those described previously[1].

In general, the zone of negative temperature coefficient has been found to extend over the same temperature range—approximately 380–460° C.—for different hydrocarbons. There are, however, marked differences with respect to the magnitude of the coefficient. Among *n*-paraffins (pentane to dodecane) the magnitude of the negative temperature coefficient decreases with increasing chain-length, the effect being particularly marked among the lower members of the series. In branched paraffins (for example, isomeric hexanes) the magnitude of the coefficient tends to increase with the degree of branching. Furthermore, the temperature-range between the onset of the negative temperature coefficient and the commencement of the following region of positive temperature coefficient also increases.

The addition of di-*t*-butyl peroxide has a pronounced effect on the zone of negative temperature coefficient. It markedly enhances the extent of reaction and lowers the magnitude of the coefficient. It also reduces the temperature-range over which the region extends. Acetaldehyde and propionaldehyde also affect the zone of negative temperature coefficient in the same manner as di-*t*-butyl peroxide, although the effect of both aldehydes is considerably less than that of the peroxide. Acetaldehyde is more effective than propionaldehyde. The addition of acetone has scarcely any effect, while methyl ethyl ketone slightly enhances the extent of reaction. Methanol and ethanol have, if anything, a slightly inhibitory effect on the reactions.

Different olefins markedly affect the zone of negative temperature coefficient: they may act either as inhibitors or accelerators. The olefins which inhibit reactions (such as ethylene, *iso*butene and 2,4,4-trimethylpentene-1) can be recognized as those resistant to oxidative degradation in the temperature-range of the negative temperature coefficient, and furthermore their saturated analogues are also unreactive in this region (Salooja, K. C., unpublished work). On the other hand, the olefins which accelerate reactions (such as butene-1, butene-2 (*cis* or *trans*), hexene-1 and hexa-1,5-diene) are those which by themselves undergo oxidation, and/or the saturated analogues of which are reactive in this region (Salooja, K. C., unpublished work).

It is clear from the effect of various types of additives that olefins of the first category mentioned above are capable of causing marked inhibition of the reactions. This suggests that such olefins may themselves be responsible for causing the onset of the negative temperature coefficient. That such olefins are indeed formed in appreciable amounts in the cool flame region preceding the zone of negative temperature coefficient is well known[2-4]. Moreover, it has also been shown that the concentration of olefins increases with temperature[5,6].

The formation of olefins in the temperature-range of the zone of negative temperature coefficient is expected from (1) the low stability of RO_2 radicals beyond the cool flame region, $RO\cdot_2 \rightarrow$ olefin + $HO\cdot_2$, and (2) a split in the carbon–carbon bond of the alkyl radical, $R\cdot \rightarrow$ olefin + $R'\cdot$. Apart from cases where the RO_2 radical corresponds to a lower carbon number fragment of the starting material, it is particularly the olefin generated by the second reaction that would be responsible for the onset of the negative temperature coefficient. This is so because only the olefins of lower carbon number (and also their saturated analogues) are likely to be more resistant to oxidation than the parent hydrocarbon.

Although analytical data are not yet available on the combustion products of all the hydrocarbons investigated so far, it does not seem unreasonable to suggest that the observed relative order of negative temperature coefficients of different hydrocarbons could be related to the type of olefins that could arise predominantly from different hydrocarbons. For example, among *n*-paraffins the lower members of the series would no doubt lead to the formation of lower carbon number olefins than the higher members of the series. Since the lower olefins, and also their saturated analogues, are more resistant to oxidation than the higher ones (ref. 7 and Salooja, K. C., unpublished work), the lower *n*-paraffins, as observed, would have a negative temperature coefficient of higher magnitude. Again, in comparison with *n*-paraffins, the branched-chain paraffins would lead to the formation of branched olefins (which are more resistant to oxidation than the corresponding straight-chain olefins (Salooja, K. C., unpublished work), and the saturated analogues of which are also far more resistant to oxidation than those of the corresponding straight-chain olefins[4,7]) and hence, in accordance with the observations, the branched-chain hydrocarbons would have a sharper negative temperature coefficient.

The effect of various additives can be readily interpreted by considering it *vis-à-vis* the chain-terminating effect of the olefins that inhibit reactions. Additives that are unreactive in the temperature range of the negative temperature coefficient would have no effect in this region. Reactive additives like acetaldehyde and, even more so, di-*t*-butyl peroxide, which can markedly increase chain-branching species, would, as observed, lower the magnitude of the negative temperature coefficient.

Apart from the role of olefins, it is possible, as suggested by several investigators (notably Satterfield and Wilson[5]), that the expected decrease in the number of highly reactive OH radicals relative to HO$_2$ radicals at temperatures above the cool flame region may also contribute to the onset of the zone of negative temperature coefficient. Further work is in progress and the results will be reported in detail elsewhere.

BIOPHYSICS

Aggregation and Staining Behaviour of Ultra-violet Irradiated Films of Nucleic Acids

During a study of the staining behaviour of ultra-violet irradiated films of deoxyribonucleic acid (deposited by evaporation from aqueous solution on glass slides and exposed to the 2357 A. emission of a 30-watt germicidal lamp), it was found that, upon exposure of an irradiated film to water or salt solution, the deoxyribonucleic acid passes into the aqueous phase as insoluble fibres readily visible to the naked eye. For a film containing 25 µgm. deoxyribonucleic acid spread over an area 10 mm. in diameter, and with an incident intensity of 10^4 ergs/cm.^{2}/sec., fibre formation is visible following several seconds irradiation. With increasing doses the dimensions of the fibres increase until, after 1–2 hr., they are 7–8 mm. in length and 200µ in diameter; beyond this point further irradiation results in degradation.

Fibre formation may also be observed on the glass slides directly under the microscope or, better still, after staining with a basic dye. Analogous results are obtained with highly polymerized deoxyribonucleic acid from widely different sources.

In some respects this phenomenon resembles that reported for commercial deoxyribonucleic acid films irradiated *in vacuo* or under dry nitrogen with the subsequent formation, in water or salt solution, of a gel susceptible to the action of deoxyribonuclease[1]. In the experiments reported here the fibres were completely insoluble in water or heated salt solution and were completely resistant to the prolonged action of deoxyribonuclease.

The apurinic acid resulting from the mild acid hydrolysis of deoxyribonucleic acid has a molecular weight of only 15,000[2] and hence a chain-length about 1 per cent that of the parent deoxyribonucleic acid. But irradiated apurinic acid forms fibres similar in magnitude to those obtained with deoxyribonucleic acid. The ultra-violet induced aggregation (polymerization) or cross-linking is consequently not dependent on the use of highly polymerized material, but involves the formation of specific intermolecular linkages. The importance of the pyrimidine rings in this reaction is testified to by the fact that polyadenylic and polyguanylic acids do not exhibit fibre formation whereas polyuridylic acid does. Ribonucleic acid reacts to only a slight degree and proteins and polysaccharides not at all.

The staining behaviour of these irradiated films is of considerable interest, particularly with regard to methyl green. Dye uptake and retention were measured quantitatively by use of dyes labelled with carbon-14 and sulphur-35, followed by end-window counting[3]. It was found that the affinity of deoxyribonucleic acid for methyl green increases by as much as 50–80 per cent upon irradiation, following which it decreases. Particularly striking is the behaviour of apurinic acid, the affinity of which for methyl green is very low; a film of apurinic acid irradiated under exactly the same conditions as a deoxyribonucleic acid film will bind as much, or even more, dye than the latter. Staining with other dyes showed that increased binding of methyl green is not due to trapping of dye molecules in the fibre interstices.

Deoxyribonucleic acid films stain Gram-negative, as compared to apurinic acid and ribonucleic acid, which are Gram-positive[4]. However, an irradiated deoxyribonucleic acid film is so strongly Gram-positive that its decolorization time approximates that prevailing for numerous Gram-positive micro-organisms.

The above, as well as other, results, which will be fully reported elsewhere, are of interest from several points of view.

(*a*) We have here an example of radiation-induced aggregation (cross-linking) of a biological polymer by ultra-violet light like that already observed for such synthetic polymers as poly(vinylchloride)[5], polyethylene and polyacrylamide[6]. In preliminary experiments we have found that ionizing radiations (γ-rays from cobalt-60 source) do not promote aggregation in either deoxyribonucleic acid or apurinic acid (cf., however, ref. 1).

(*b*) A nucleic acid film in air is, in some respects, more representative of the state of deoxyribonucleic acid in living cells than is a solution of deoxyribonucleic acid. We have indeed found some correlation in staining behaviour between irradiated nucleic acid films and some micro-organisms and tissue sections. It would obviously be desirable to examine the irradiated deoxyribonucleic acid, apurinic acid and polyuridylic acid films by X-ray diffraction.

(*c*) The extent to which deoxyribonucleic acid binds methyl green, which is of considerable importance in cytochemistry, is seen to be dependent not only on the molecular weight of the nucleic acid but also on its state of aggregation which, in cell nuclei, may be quite high. Irradiated films of deoxyribonucleic acid should also be useful for *in vitro* studies of the mechanism of Gram staining[4].

We are indebted to Dr. S. Ochoa and Dr. R. F. Beers for gifts of enzymatically synthesized polyadenylic acid and to Dr. A. M. Michelson for chemically synthesized polyuridylic and polyguanylic acids.

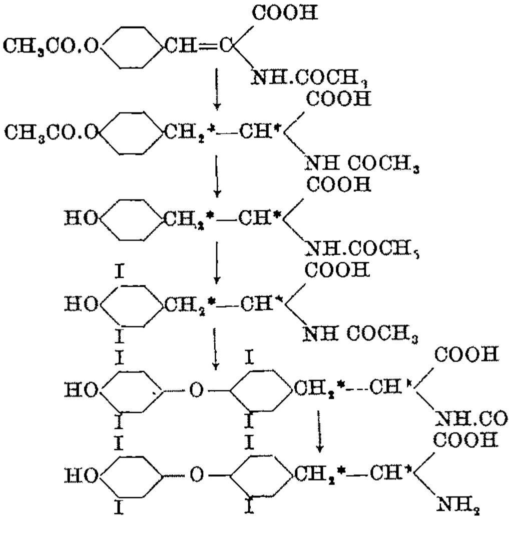
BIOCHEMISTRY

Synthesis of Tritium-labelled Tyrosine, 3 : 5-Diiodotyrosine and Thyroxine

ALTHOUGH much of the progress in thyroid hormone biochemistry is due to the use of thyroxine and 3 : 5 : 3′-triiodothyronine labelled with iodine-131, the high metabolic lability of the iodine atoms makes it impossible to follow the fate of these substances beyond the stage of enzymic deiodination[1]. The low specific activity of thyroxine labelled with carbon-14[2] has ruled out its use under physiological conditions. Hence, with the availability of pure tritium gas and methods for its measurement, it was decided to prepare tritium-labelled thyroxine. The commonly used methods of exchange could not be used because of the danger of reductive deiodination by tritium gas. The procedure summarized below, and which involved the synthesis of N-acetyl-tyrosine and N-acetyl-3 : 5-diiodotyrosine as intermediates, was finally adopted. All compounds were hence labelled in 2 carbon atoms of their alanine side-chain.



4-Acetoxy-α-acetamidocinnamic acid, synthesized according to Saul and Trikojus[3], was dissolved in dioxan and reduced with tritium gas in the presence of platinum oxide to O,N-diacetyl-tyrosine. (This reaction was carried out by Dr. E. Anthony Evans at the Radiochemical Centre, Amersham.) The specific activity of O,N-diacetyl-tyrosine was 178·8 mc./m.mole. Tritium-labelled tyrosine could be obtained by its hydrolysis.

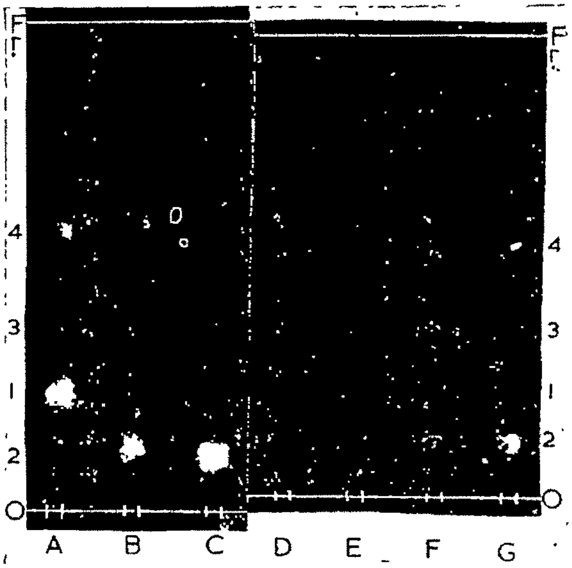


Fig. 1 Autoradiogram of a chromatogram developed to illustrate the reactions leading to the formation of ^{3}H-labelled N-acetyl-thyroxine. *A*: N-acetyl tyrosine in ammoniacal solution; *B*: After the addition of 1·5 m.mole iodine to the ammoniacal solution; *C*: after the addition of 5·0 m.mole iodine; *D*: 24 hr. after the incubation at 37° of reaction products in solution *C*, *E*: 4 days of incubation; *F*: 8 days; *G*: 12 days; 1: N-acetyl-tyrosine; 2: N-acetyl-3 : 5-diiodotyrosine; 3: N-acetyl-thyroxine; 4: unknown tritium-labelled material present as contamination in the original sample of O,N-diacetyl-tyrosine. Chromatographic solvent: *n*-butanol (80)-dioxan (20)-2*N* ammonia, *O*: origin of chromatogram; *Fr*: solvent front. Small amounts of radioactive products formed as a result of self-radiation damage are not visible in the autoradiogram

For the synthesis of labelled diiodotyrosine and thyroxine, 0·150 m.mole O,N-diacetyl-tyrosine was partially hydrolysed in 0·325 ml. 1 *N* sodium hydroxide at room temperature for 30 min. to N-acetyl-tyrosine. 0·350 ml. of concentrated ammonia (sp. gr. = 0·880) solution was added after neutralization of sodium hydroxide with 0·110 ml. 3·5 *N* hydrochloric acid. To this was added dropwise 0·5 m.mole iodine in potassium iodide at 0° and the excess iodine was neutralized with $Na_2S_2O_5$. The N-acetyl-3 : 5-diiodotyrosine formed is separated by preparative paper chromatography if diiodotyrosine is to be obtained. It is not separated if thyroxine is to be prepared; instead the volume of the solution was reduced to 0·3 ml. to which 1 ml. of 0·05 *M* borate buffer, *p*H 7·9, was added. Incubation of this solution at 37° C. led to the coupling of 2 molecules of N-acetyl-diiodotyrosine to 1 molecule of N-acetyl thyroxine, as described by Pitt-Rivers[4]. At the end of 12 days of incubation, the tritiated N-acetyl-thyroxine, the uncoupled N-acetyl-diiodotyrosine and other radioactive products were separated by preparative paper chromatography. Paper chromatography and autoradiography of aliquots withdrawn at different stages of the synthesis were used to follow the course of reaction as shown in Fig. 1.

Autoradiography was found to be a most convenient method for the detection and estimation of tritiated substances on chromatograms. Liquid scintillation counting confirmed the validity of such an estimation. The yield of tritiated N-acetyl-thyroxine was low: 0·009 m.mole (specific activity 56 mc./m.mole). Half the radioactivity would be lost in one alanine side-chain split off in the condensation of two molecules of N-acetyl-diiodotyrosine. The N-acetyl group was hydrolysed with 5 N hydrochloric acid in the presence of iodide to prevent deiodination. Only the racemic forms of thyroxine, diiodotyrosine and tyrosine could be prepared by the above method. All attempts to obtain the L-forms by the action of L-amino-acid de-acetylase from pig kidney or penicillium extracts have so far failed.

We are indebted to Dr. R. Pitt-Rivers for help and guidance.

Inhibition of Lipid Peroxidation in Microsomes by Vitamin E

The requirement for vitamin E is largely represented by a need for a biologically active lipid antioxidant. Vitamin E-deficient animals show *in vivo* lipid peroxidation and a wide variety of metabolic changes[1]. How metabolic changes are related to lipid peroxidation is a major problem.

Recently, we found[2] that isolated mitochondria deteriorate by hæmatin-catalysed lipid peroxidation. In addition, mitochondria isolated from the livers of vitamin E-deficient rabbits had undergone lipid peroxidation *in vivo* as measured by the thiobarbituric acid reaction. When isolated these mitochondria were more labile to lipid peroxidation *in vitro* than those from controls. This suggests that the free-radical intermediates of lipid peroxidation damage the mitochondria structurally and functionally, thus bringing about deranged metabolism.

Microsomes should be labile to lipid peroxidation for the same reasons as mitochondria. The microsomal fraction contains 30–40 per cent total lipid, mainly phospholipides, and contains twice the amount of polyunsaturated lipids on a nitrogen basis as do mitochondria. Some of these lipids are in close molecular proximity to cytochrome b_5. Cytochromes are among the most potent lipid peroxidation catalysts. Vitamin E is the only known lipid antioxidant in microsomes where it would function to inhibit lipid peroxidation.

Following the same course of research with microsomes as with mitochondria[2] it was found that the microsome fraction from rat livers deteriorated by lipid peroxidation at a rate of 0·1 ml. oxygen reacted/mgm. nitrogen/hr. at 37° C. Increase in thiobarbituric acid reactants paralleled oxygen absorption during the first 2 hr. Added α-tocopherol at 0·25 mgm./mgm. nitrogen gave 72 per cent inhibition of oxygen absorption and 69 per cent inhibition of thiobarbituric acid reactants. Since 0·01 M cyanide and 0·1 M methylene blue give 71–94 per cent inhibition as measured by oxygen absorption or thiobarbituric acid reactants, the lipid peroxidation appears to be catalysed by cytochrome b_5 and other hæmochromes present. Cytochrome b_5 destruction in a 4-hr. reaction was 80 per cent. To determine if the microsomes of vitamin E-deficient animals undergo lipid peroxidation *in vivo* they were isolated from the livers of vitamin E-deficient and control rabbits. The packed volume yield was one-third and the total nitrogen/ml. was six times higher for the microsomes from the vitamin E-deficient as compared to controls. The significance of these differences is at present unknown. Microsomes from vitamin E-deficient rabbits had 5·7 times as much thiobarbituric acid reactants per ml. as the controls. This highly significant difference ($P = 0·001$) indicates that the microsomes had undergone lipid peroxidation *in vivo*.

Lipid peroxidation damage to the microsomes of vitamin E-deficient animals may account for degeneration of microsomes as observed by electron microscopy[3], increased turn-over rate of some nucleic acids[4], effects on protein synthesis[1], and decreased ascorbic acid synthesis[5].

Biosynthesis of Glycerides in the Mucosa of the Small Intestine

It is generally agreed that a mixture of free fatty acids, glycerol, monoglycerides and diglycerides is absorbed by the intestinal cells during digestion of fat and that the chyle secreted by these cells contains mainly triglycerides[1]. The present communication describes some studies on the biosynthesis of triglycerides by mitochondrial preparations from the mucosa of the small intestine of the rabbit and the rat.

For the preparation of the mitochondria, the small intestine was removed and washed with ice-cold potassium chloride (1·3 per cent). The mucosa was scraped off, homogenized in 10–15 vol. of ice-cold sucrose (0·25 M), and the mitochondrial fraction obtained by the usual sedimentation methods[2]. The washed mitochondria were suspended in potassium phosphate buffer (0·05 M, pH 7·0). 1·0 ml. of this suspension (containing between 1 and 4 mgm. protein per ml.) was incubated for 1 hr. at 37° C. with palmitic acid labelled with carbon-14 and various co-factors (see Table 1). Pure DL-α-glycerophosphate and labelled palmitic acid were used in aqueous solution as their potassium salts. α-Monostearin and α,β-dipalmitin were emulsified with small amounts of potassium oleate (0·8 μmole per 16 μmoles of α-monostearin; 1·2 μmoles per 4·0 μmoles of α,β-dipalmitin). All co-factors were at pH 7·0.

Reaction was stopped by the addition of 1/10 vol. of 50 per cent trichloracetic acid and the precipitate washed with water. The lipids were extracted with organic solvents and purified on alumina columns. The glyceride fractions were taken to dryness and counted as described elsewhere[3].

Experiments 1 and 2 show that α-monostearin, α,β-dipalmitin and α-glycerophosphate all stimulated the incorporation of labelled fatty acid into glycerides

Table 1

Exp.	Additions (μmoles)	Activity (disintegrations/ min./test)
1	None*	1,740
	α-monostearin (16)†	1,750
	α-monostearin (16) + all co-factors‡	2,515
	α-glycerophosphate (7)†	1,760
	α-glycerophosphate (7) + all co-factors	8,100
2	α,β-dipalmitin (4)†	1,600
	α,β-dipalmitin (4) + all co-factors	2,120
3	α-glycerophosphate (7)†	1,270
	α-glycerophosphate (7) + all co-factors	3,760
	,, omit only GSH	3,850
	,, omit only $MgCl_2$	2,180
	,, omit only CoA	1,760
	,, omit only ATP	1,350

Each system contained: 1·0 ml. of rabbit mitochondrial suspension in 0·05 *M* potassium phosphate buffer, *p*H 7 0, and 0 6 μM of labelled palmitic acid (0 4 μc.). After the additions described above, the final volume was adjusted to 3·0 ml with distilled water. Incubation time was 60 min. To those systems which did not contain monoglyceride initially, 16 μM of α-monostearin in aqueous solution (0 4 ml.) was added immediately prior to precipitation with trichloracetic acid. This was to act as a carrier for any radioactive lipid formed.

* Reaction stopped after zero minutes of incubation. This represented the level of unchanged labelled palmitic acid coming through the isolation procedure. This figure varied with each separate experiment, and was approximately 0·1 per cent of the original fatty acid added.

† This value was taken as the blank for the experiment, and was almost identical to the activity of the zero time system.

‡ 'All co-factors' refers to the following additions: ATP (5), CoA (0 25), GSH (10), $MgCl_2$ (10).

Abbreviations: ATP, adenosine triphosphate; CoA, coenzyme *A*; GSH, reduced glutathione.

when supplemented with adenosine triphosphate, coenzyme *A*, reduced glutathione, and magnesium chloride. α-Glycerophosphate gave an apparently greater stimulation than the lower glycerides. This could partially be explained by a dilution effect if the potassium oleate (added to emulsify the glycerides) was incorporated in significant amounts. If the rate for this was the same as that for labelled palmitate, then the relative rate for α-glycerophosphate to α-monostearin (Exp. 1) would be 100 to 30. In experiments 2 and 3 (the same mitochondrial suspension was used in both) the relative rate for α-glycerophosphate to α,β-dipalmitin would be 100 to 64. These ratios do not take into account the specific activities of the radioactive glycerides synthesized from these precursors. Since the specific activity of the triglyceride formed from α-glycerophosphate is three times that from α,β-diglyceride, the relative rate for these becomes 100 to 192. Furthermore, the lower glycerides might be less available than glycerophosphate since they were added as emulsions.

When a mixture of α-monostearin and α-glycerophosphate was added to the system, the incorporation was found to be the same as the sum of that given by either separately.

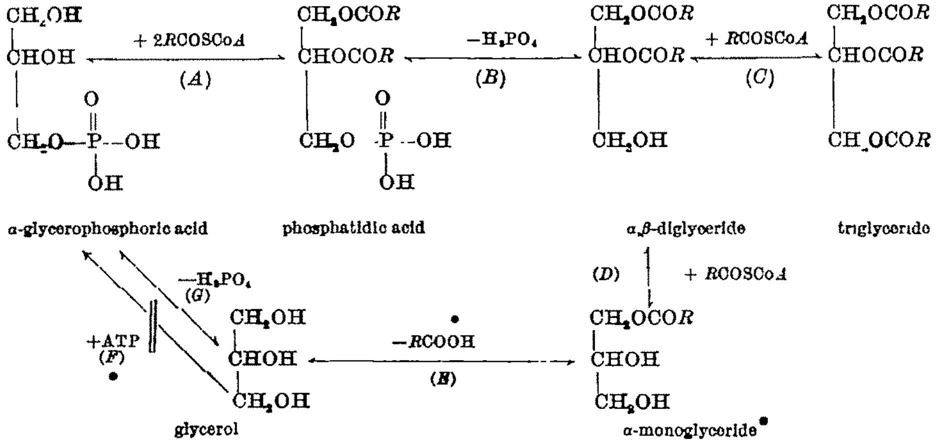
Experiment 3 shows the need for certain co-factors; there is a definite requirement for adenosine triphosphate, coenzyme *A* and magnesium chloride, but not for glutathione. It is possible that the mitochondria can reduce the coenzyme *A* which had not been reduced before addition.

The radioactive glycerides formed from α-glycerophosphate were separated on silicic acid columns. 90 per cent of the radioactive lipids were eluted from the columns in the positions where tri- and di-glycerides have been shown to come.

The above results indicate a pathway similar to that suggested by Stein, Tietz and Shapiro[4] for the synthesis of triglycerides in rat liver mitochondria, where α-glycerophosphate and phosphatidic acid are precursor and intermediate respectively. Dawson and Isselbacher described in a report of preliminary experiments[5] the incorporation of fatty acids labelled with carbon-14 into neutral fat using homogenates of the mucosa of the rat small intestine. They found that the incorporation was stimulated by adenosine triphosphate, coenzyme *A* and magnesium ions. Buell and Reiser[6] showed that α-glycerophosphate was involved in the biosynthesis of glycerides in subcellular fractions of the swine small intestine.

The appreciable incorporation found with monoglyceride would suggest an additional pathway, that is, the direct esterification of monoglyceride to diglyceride (reaction *D*). Though the monoglyceride might be hydrolysed (*E*), the phosphorylation of glycerol to α-glycerophosphate by adenosine triphosphate (*F*) does not seem to occur in intestinal extracts[6]. Adenosine triphosphate, coenzyme *A* and magnesium ions are required for the formation of activated long-chain fatty acids which participate in reactions *A*, *C* and *D*. In the present work, the fatty-acyl–coenzyme *A* synthetase was demonstrated in mitochondrial preparations of intestinal mucosa using the assay system described by Kornberg and Pricer[7].

Similar studies were carried out using mitochondrial preparations from rat intestine; but here it was found that α-glycerophosphate did not stimulate the incorporation of labelled palmitate to any great extent. The relative rates obtained were: α-monoglyceride to α-glycerophosphate, 100 to 10, giving further evidence for the occurrence of reaction *D*. There was fourteen times as much alkaline phosphatase (per mgm. protein) in the preparations from



Suggested pathways for the biosynthesis of triglycerides in subcellular fractions of intestinal mucosa rat intestine as in those from the rabbit. The relatively low incorporation obtained in the rat with α-glycerophosphate might therefore be due to the more rapid splitting of this compound to inorganic phosphate and glycerol. The glycerol cannot then be used for glyceride synthesis[6]. α-Monostearin, when supplemented with adenosine triphosphate, coenzyme *A*, glutathione and magnesium chloride, stimulated the incorporation of labelled palmitate to about the same extent as in the rabbit.

A more detailed report of this work will be published elsewhere.

Presence of Sialic Acid in Connective Tissues

SIALIC ACID was first demonstrated in the submaxillary gland by Blix[1] and afterwards in many secretions of higher animals—in liver, ovomucin, meconium, colostrum, erythrocytes, nervous tissue and micro-organisms. Comprehensive reviews on sialic acids have been published by Zilliken and Whitehouse[2] and by Blix[3].

The presence of sialic acid in connective tissue has not so far been reported.

In the course of our research on chemical composition of epiphyseal cartilage[4] and particularly on the mucopolysaccharidic components[5], the presence of this acid in epiphyseal cartilage of young rabbits was demonstrated[6]. We have extended this study to other tissues in order to see whether a polysaccharide containing sialic acid was present in the ground-substance of all connective tissues.

The tissues were hydrolysed with 0·1 *N* sulphuric acid at 80° C. for 1 hr.; the hydrolysate was filtered on a sintered glass filter and chromatographed on 'Dowex 2 × 8' by Svennerholm's method[7]; after elution with 1 *M* acetate buffer *p*H 4·6 the eluate was tested by the resorcinol reaction[7] and sialic acid was identified by the absorption spectrum of the chromatic reaction.

To identify and determine quantitatively the sialic acid, we used as standard compound N-acetylneuramic acid isolated from sheep submaxillary gland and kindly supplied to us by Prof. G. Blix.

The presence of sialic acid was demonstrated in the following tissues: epiphyseal cartilage of young pigs (1·6 mgm. per gm. fresh tissue), rib cartilage of young rabbits (0·6 mgm./gm.), bovine cornea (0·4 mgm./gm.), bovine aorta (0·6 mgm./gm.) and bovine dental pulp (0·6 mgm./gm.); smaller quantities are also present in bone and dentin.

From these results we may conclude that sialic acid is a diffuse constituent of the polysaccharidic fraction of ground substance in connective tissues.

We thank Prof. G. Blix for his generous supply of N-acetylneuraminic acid.

Configuration of Inositol Phosphate in Liver Phosphatidyl Inositol

THE hydrolysis of synthetic glycerol 1-(inositol 2-phosphate)[1,2] has recently been compared with that of the glycerylphosphoryl inositol isolated from hydrolysates of liver phosphatidyl inositol[3]. The results suggest that the phosphate group in the original lipid is attached to the 1- or 2-hydroxyl of the *myo*inositol. Inositol 1-phosphate should be optically active, while inositol 2-phosphate should not.

Previous work[4,5] had suggested that the inositol monophosphate produced on hydrolysis of ground-nut or soya phosphoinositides was optically inactive. It was therefore concluded[6] that phosphatidyl inositol has the 2-phosphate structure. However, Pizer and Ballou[7] have now provided evidence that the inositol monophosphate from soya phosphoinositide has a small but definite optical activity ($[\alpha]^{25}_{589}$, + 3·4° for the *cyclo*hexylamine salt,' −9·8° for the free acid). This called for a re-investigation of the earlier results.

One of the problems in determining the rotation of inositol monophosphate from soya lipids is that there are contaminating sugar phosphates which are strongly dextro-rotatory. A small amount of such an impurity could easily mask the low inositol monophosphate rotation. The soya inositol monophosphate, prepared as before[5], has therefore been purified by passage through three successive 'Dowex 1' columns, two using the formic acid–ammonium formate system and one using the sodium borate–ammonium formate system[3]. It was finally crystallized as a *cyclo*hexylamine salt and shown to be optically active. Since the rotation was quite small, determinations were made at several different wave-lengths. The activity increased considerably at lower wave-lengths. Molecular rotation was as follows: +12° (600 mμ), +18° (500 mμ), −32° (400 mμ), −54° (350 mμ), −89° (300 mμ). Calculations are based on the di*cyclo*hexylamine salt. Using a similar salt of inositol monophosphate produced by enzymic degradation of phytic acid and believed to be the 2-phosphate[5], values of zero (within the error of the instrument) were obtained at all the above wave-lengths. Soya inositol monophosphate, as the *cyclo*hexylamine salt, had $[\alpha]^{25}_{589}$ + 3·1°. All measurements were made in water.

The soya phosphoinositide therefore seems to have an inositol 1-phosphate structure. We wished to confirm this for liver phosphatidyl inositol, which may not have the same structure, and so an entirely different method was used. Acid or alkaline hydrolysis would be expected to produce the same mixture of inositol 1- and 2-phosphates whether the original lipid had the 1- or 2-structure. By analogy with the action of diesterases on polynucleotides, it seemed probable that enzymic hydrolysis of phosphatidyl inositol would give only one isomer and avoid migration problems. An enzyme releasing inositol monophosphate from this lipid had already been isolated in our laboratory[8]. Samples of the barium salt of inositol monophosphate obtained from the enzymic digest were chromatographed on paper in 6 : 3 : 1 *n*-propanol/ammonia/water, after removal of barium ions with 'Zeo-Karb 225'. Inositol 1- and 2-phosphates are separable in this solvent[7,9] if the papers are not overloaded. Comparison with authentic 2-phosphate and a mixture of 1- and 2-phosphates produced by acid-catalysed migration[9] showed that the enzyme released inositol 1-phosphate. A trace of the 2-compound was seen, probably produced during the isolation.

This, together with the evidence from the hydrolysis of synthetic glycerol 1-(inositol 2-phosphate), points to the inositol 1-phosphate structure for liver phosphatidyl inositol. Hanahan and Brockerhoff[10] recently studied the periodate oxidation of glycerylphosphoryl inositol and reached the same conclusion.

A more detailed account of this work will be published elsewhere.

We are indebted to Dr. W. Klyne of the Postgraduate Medical School, London, for the rotatory dispersion studies. We wish to thank Prof. A. C. Frazer for his continued interest. Miss M. Bason provided valuable technical assistance.

Antigen–Antibody in Liquid Two-Phase Systems : a Method for studying Immunological Reactions

THE behaviour of proteins[1–3], viruses[4–7] and cell particles[8,9] in aqueous polymer two-phase systems has recently been described. These phase systems consist of water and two water-soluble polymers. Mixtures in water of dextran and methylcellulose, or dextran and polyethylene glycol, are examples of such phase systems. The important characteristic of these systems is their high water content, so that most biochemical substances can be handled in them without denaturation. Each protein or virus particle is distributed in such phase systems in a characteristic manner so that a reproducible partition coefficient is found (partition coefficient, K = concentration of the partitioned substance in the top phase divided by the concentration of the same substance in the bottom phase) The partition coefficient of a particle in a given phase system depends mainly on the surface property of the particle and its size. The larger the size of particle the more unilateral is the distribution. Changes in the size of a protein molecule are reflected in a change in the partition coefficient For example, the dissociation of *Helix pomatia* hæmocyanin at certain pH values may be readily followed by measuring its partition coefficient in a dextran–methylcellulose system. Other changes in the structure of a protein molecule, such as the denaturation of serum albumin at low pH values, may cause the protein to move from one phase to the other.

In an immunological reaction the antigen and the antibody combine to form a complex which has a size larger than either of the reactants and possibly also has somewhat different surface properties. It was therefore of interest to study such a reaction in a two-phase system. The present communication describes experiments in which the reaction between the protein phycoerythrin and its rabbit antiserum in the phase systems dextran–methylcellulose and dextran–polyethylene glycol has been studied. Phycoerythrin was chosen as an antigen because it is coloured and can easily be measured by its strong light absorption at 540 mμ. In addition, its behaviour in the phase system has been previously studied in detail[1,3].

A typical experiment in the dextran–polyethylene glycol system was carried out in the following way. 0 5 ml. of an antigen solution and 1 ml. of diluted antiserum, both dialysed against 0·1 M phosphate buffer pH = 6 8, were mixed and allowed to stand at room temperature for 1 hr. A mixture was then added which contained dextran ('Dextran 500' from Pharmacia, Uppsala, Sweden) and polyethylene glycol ('Carbowax 6000', from Carbon and Carbide Chemicals, U.S.A.), and phosphate buffer pH = 6·8, in such proportions that, after mixing with the antigen–antibody solution, the concentration in dextran was 7 per cent w/w, polyethylene glycol 4·4 per cent w/w and the phosphate buffer 0·1 M. Mixing was then accomplished by inverting the tubes several times. Blanks containing antigen + normal sera and antigen only were run in parallel. The tubes were allowed to stand 2 hr. for phase separation.

In the dextran–polyethylene glycol system with 0 1 M phosphate buffer pH = 6·8, phycoerythrin is distributed in favour of the top phase with a K-value of about 5 while γ-globulin is distributed in favour of the bottom phase with a K-value of about 0·3. Thus the major portion of the antigen and the antibody when separate go to different phases in this system.

It could then be observed that in those tubes which contained antigen and antibody together, a red-coloured precipitate had collected at the interface. This occurred even in those tubes where the antigen was present in excess, that is, when the same proportion of antigen–antiserum mixed without the phase system did not show a precipitate. Thus, the presence of soluble antigen–antibody complexes had been visualized by a precipitation at the interface. Normal serum did not affect the distribution of the antigen.

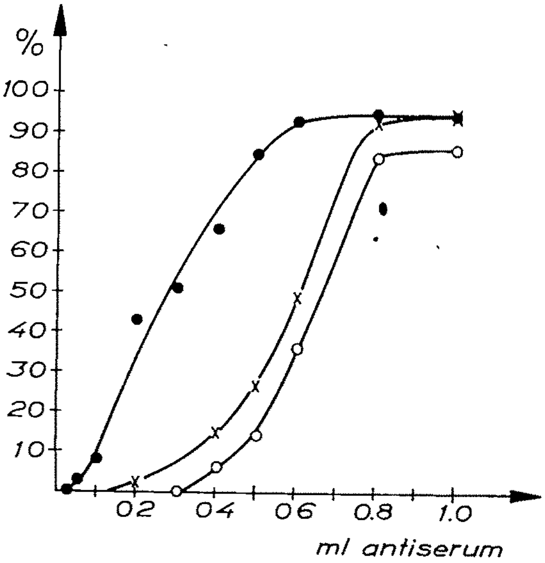

Fig 1 Immunological reaction between a constant amount of phycoerythrin (0·5 ml with E(1 cm., 540) = 2·16) and its rabbit antiserum in a two-phase system of dextran and polyethylene glycol at room temperature (filled circles), and by ordinary precipitin tests at room temperature (open circles) and at + 37° C. (crosses) For the phase system tests the reduction in the extinction of the top phase in per cent of the extinction of the top phase of the blank is plotted as the ordinate. For the ordinary precipitin tests the amount of antigen precipitated by centrifugation as a percentage of the total antigen is plotted as the ordinate

In order to estimate the amount of antigen precipitated at the interface, samples were drawn from the top phase, diluted with half their volumes, and the extinction at 540 mμ was measured. A reduction in the extinction indicates that antigen had precipitated, and this was expressed in per cent of the antigen in the blank containing no serum. Fig. 1 shows the result of such an experiment.

When a study was made of the effect on the immunological reaction of dextran or polyethylene glycol at the same concentrations as in their respective phases, it was found that they increased the precipitation in the tubes containing excess antigen. It is therefore probable that in the dextran–polyethylene glycol system the adsorption of precipitate at the interface is almost entirely due to a decreased solubility of the antigen–antibody complex in the phases. However, the fact that one part of the complex, the antigen, has more affinity for the top phase and that the other part, the antibody, has more affinity for the bottom phase may possibly contribute also toward increasing the adsorption of the complex at the interface.

An experiment in the dextran–methylcellulose system was carried out in the following way. 0·2 ml. antigen and 0·8 ml antiserum at different dilutions were mixed and allowed to stand at room temperature for 2 hr. A polymer mixture containing dextran (dextran with a limiting viscosity number of 0·68 dl./gm.) and methylcellulose ('Methocel 4000', from Dow Chemical Co., U.S.A.) in such proportions that after the addition to the antigen–antibody mixture a concentration in dextran of 0·64 per cent (w/w) and a concentration in methylcellulose of 0·56 per cent (w/w) was obtained. The final system also contained 0·15 M sodium chloride and 0·01 M phosphate buffer $pH = 6{\cdot}8$. This phase system is similar to system B of ref. 1 but contains a smaller bottom phase.

In the dextran–methylcellulose system both phycoerythrin and γ-globulin are separately distributed rather evenly, although slightly in favour of the bottom phase (K value about 0·9)[1]. In this system it was found that protein molecules and virus particles are distributed mainly according to their surface areas[4]. The appearance of the tubes containing antigen and antibody together was as follows. In the tubes with the largest amounts of antiserum a precipitate had fallen to the bottom of the tube. These tubes contained antigen and antibody in such proportions that when they were mixed in the absence of the phase system a precipitate was also formed. When antigen was in excess no precipitate was observed, but almost all the colour was in the bottom phase. In the presence of normal serum the colour was evenly distributed. Thus, the formation of soluble antigen–antibody complex had been visualized, in this system, by a unilateral distribution of the antigen colour.

The extinction of the top phase was measured as described above, and in Fig. 2 the reduction of the extinctions is expressed in per cent of the extinction of the blank containing antigen and normal serum.

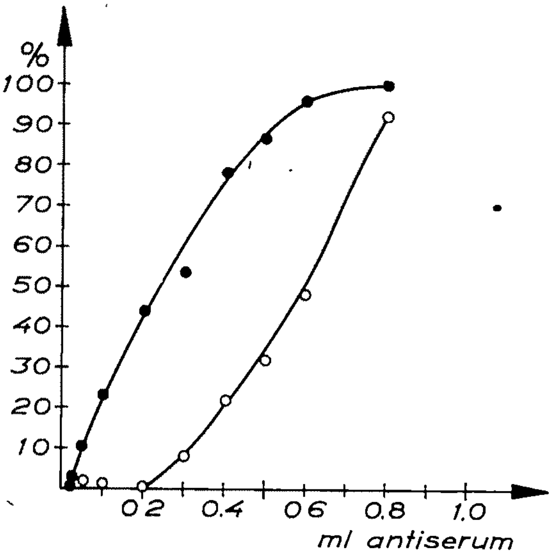

Fig. 2. Immunological reaction between a constant amount of phycoerythrin (0·2 ml. with E(1 cm., 540) = 5·0) and its rabbit antiserum in a two-phase system of dextran and methylcellulose at room temperature (filled circles) and by ordinary precipitin tests at room temperature (open circles). The ordinates are plotted as in Fig. 1

The two polymers, dextran or methylcellulose, did not themselves have any effect on the immunological reaction when they were present in the same concentrations as in their respective phases.

It is therefore probable that the unilateral distribution of the antigen is in a large part due to the size of its complexes with the antibody. According to previous findings, large protein molecules such as hæmocyanin and virus particles have a rather uneven distribution in the dextran–methylcellulose system used here[1,4].

Figs. 1 and 2 show that an increased sensitivity in measuring the antigen–antibody reaction in the antigen excess region has been achieved by both these systems. It is therefore suggested that aqueous polymer phase systems may be used with advantage in the study of immunological reactions, particularly those which do not give rise to a precipitate in ordinary tests.

We wish to thank Prof. A. Tiselius for his stimulating interest in this work. It has been aided

Presence of Metanephrine and Normetanephrine in Normal Human Urine

IN 1957, Axelrod reported that epinephrine and norepinephrine were O-methylated at the C-3 position, giving metanephrine (3-O-methylepinephrine) and normetanephrine (3-O-methylnorepinephrine), respectively. in the rat[1]; in addition, he found that these compounds were normally excreted in rat urine[2]. The excretion of normetanephrine in the urine of humans with pheochromocytoma has also been reported[3]. More recently, the importance of the pathway for 3-O-methylation of epinephrine has been confirmed in man[4]. This report concerns the identification of metanephrine and normetanephrine of endogenous origin in the urine of normal human males.

Preliminary attempts to isolate these compounds were not successful because free metanephrine and normetanephrine are present in small amounts and are labile. Since the major portion of these metabolites was found to be excreted in a conjugated form, the conjugates were isolated by chromatography on ion-exchange resin[5], freed by hydrolysis, and identified.

A tracer amount (less than 0·018 μM) of a conjugate of tritiated metanephrine sulphate (3-O-methyl-7-^{3}H-epinephrine-4-O-sulphate), prepared biosynthetically, was added to 100 ml. portions of five individual urine specimens from normal human males; this amount of ^{3}H-metanephrine sulphate was too small to give spots on the chromatograms. These specimens were filtered and chromatographed on 1 × 10 cm columns of 'Dowex 1', acetate form. Distilled water (200 ml.) and 3-100 ml. portions of 0·2 N acetic acid were passed through each of the columns; the effluent was collected in 100 ml. fractions.

The radioactivity was eluted in the 0·2 N acetic acid fractions; these fractions from each individual column were combined and lyophilized. The resulting residues were redissolved in water. No substances in these urine extracts gave the phenolic reactions of metanephrine or normetanephrine prior to hydrolysis. Aliquots from the concentrated solutions of urine extracts were hydrolysed by heating with 1 N hydrochloric acid in a water bath at 37° C. for 48 hr. Approximately 2 per cent of each of the hydrolysed extracts was chromatographed on Whatman No. 1 filter paper in four different solvent systems: (*a*) *n*-butanol/glacial acetic acid/water (80 : 20 : 20); (*b*) *iso*-propanol/7 N ammonia (80 : 20); (*c*) benzene/propionic acid/water (40 : 40 : 20), and (*d*) *n*-butanol/*iso*-propanol/15 N ammonia (80 : 30 : 20). The urinary metabolites gave colour reactions with diazotized sulphanilic acid, diazotized *para*-nitroaniline and N-2,6-trichloro-*p*-quinoneimine that were identical with authentic metanephrine and normetanephrine.

The colour reactions, migration on paper chromatograms, and behaviour on ion exchange resins indicate that endogenous metanephrine and normetanephrine are excreted by normal human males in the absence of pheochromocytoma or of administration of exogenous epinephrine. The metabolites are excreted mainly as conjugates; detailed evidence to be presented elsewhere indicates that these are sulphoconjugates in humans. Although much valuable information has been obtained by analysis of urinary epinephrine and norepinephrine, these compounds represent only a small percentage of the total endogenous production. Since urinary metanephrine and normetanephrine, free and conjugated, and 3-methoxy-4-hydroxymandelic acid represent the major portion of exogenous, and presumably endogenous, epinephrine and norepinephrine[1,2,4], analysis of these O-methylated metabolites appears to offer promise of a more valid estimate of endogenous production of these important hormones.

We wish to thank Dr. Julius Axelrod and Dr. Seymour S. Kety for many helpful discussions during the course of this study.

ANIMAL PHYSIOLOGY

Reserpine and the Levels of Serotonin and Norepinephrine in the Brain

As an outgrowth of the results obtained in a number of laboratories, there appeared an explanation for the effect of reserpine which was based on the existence of reduced levels of serotonin and norepinephrine in the brain at a time when no reserpine was detectable[1]. Most of these methods suffered from the experimental use of massive doses of reserpine, which rendered the animal quite immobile. Subsequent work, using much lower doses of reserpine labelled with tritium and carbon-14, demonstrated that reserpine was present in the brains of guinea pigs at an unchanging concentration over the entire period of observable pharmacological effects[2]. From these investigations it was not possible to demonstrate any correlation between the intensity of effect of the drug and its concentration in the brain. With these

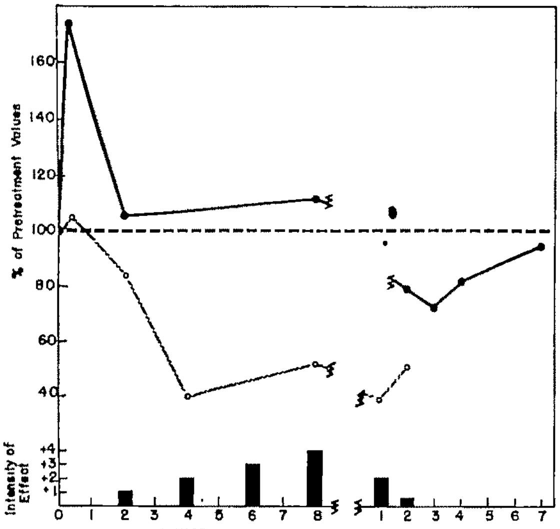

Fig. 1. Changes in levels of brain serotonin and catecholamine in the guinea pig at various times after a subcutaneous injection of 0·1 mgm./kgm. of reserpine. —●—●— catecholamines; —○— —.—○—, serotonin

facts in mind it was decided to determine if the changes in the levels of brain serotonin and/or norepinephrine could be correlated with the observable pharmacological effects.

As in the experiments with the labelled reserpine, the drug was administered subcutaneously at a dose of 0·1 mgm./kgm. to female guinea pigs weighing approximately 300 gm. The animals were killed by decapitation at the times shown in Fig. 1. The values in the graphs represent the average from 8 animals, except in the case for 2- and 3-day norepinephrine analyses, which are derived from 12 animals. Catecholamine analyses were carried out on ether-washed trichloracetic acid extracts according to Weil-Malherbe and Bone's method[3], and using a Klett fluorimeter. Careful adjustment of *p*H was necessary before addition of the tissue extracts to alumina columns. Serotonin was measured by Bogdanski's method[4], using an Aminco spectrophotofluorimeter.

20 min. after the injection of reserpine, the animals showed no gross drug effects and brain serotonin-levels did not vary statistically from control values. Catecholamine-levels, however, showed a 74 per cent increase over controls. After 2 hr. the animals began to show signs of drug action in the form of a very mild ptosis. Serotonin-levels decreased by about 16 per cent and catecholamine-levels had returned essentially to control values. The pharmacological effects increased in intensity, so that after 4 hr. the ptosis had become more severe and miosis was evident. Serotonin-levels had by this time reached 60 per cent of control values.

8 hr. after injection, the gross pharmacological effects had reached maximum intensity, while serotonin- and catecholamine-levels did not change from the previously measured value. The effects of the drug began to decrease in intensity, so that after two days almost all the symptoms had disappeared. At this time the serotonin-levels had not changed significantly from the 4-hr. value, while the catecholamine-levels had begun to fall, reaching 79 per cent of control values. After three days, the catecholamine value had fallen to 72 per cent of controls, and by seven days was essentially back to control-levels. This fall after two and three days, as well as the rise after 20 min., were found to be highly significant at the 1 per cent level, as determined by analysis of variance and the D. B. Duncan multiple range test[5] (we wish to thank Mrs. H. D. Slywestrowicz for the statistical analyses of the results).

Heart catecholamines increased by 29 per cent in 20 min. and 45 per cent in 2 hr. and then fell to control values at 8 hr. These levels continued to fall, reaching 50 per cent of controls by 24 hr. and remaining there for seven days. Spleen catecholamines also showed the increase at 20 min., reaching almost twice the control values.

These results constitute the first demonstration of a rise in catecholamine content following the administration of reserpine. By the use of selective filters and different times and heats of reaction during the condensation of catecholamine with ethylenediamine, it was established that epinephrine contributed little if any to the fluorescence which developed. While some of this fluorescence is undoubtedly due to dopamine, it had been shown that the concentration of this catecholamine was also reduced by large doses of reserpine[6].

In any event, these results have shown that the changes in the levels of catecholamines and serotonin following reserpine do not necessarily occur in the same direction or to the same degree. In addition, they demonstrate that under the conditions of the experiment, where a pharmacological rather than a toxicological dose was administered subcutaneously, the intensity of the gross observable effects of reserpine could not be correlated with the levels of amines in the brain. It is also apparent that neither the changes in amine-levels nor the intensity of drug effect could be correlated with the concentration of reserpine in these brains[2]. Until it becomes possible to understand the manner in which these amine-levels are maintained, it will be difficult to describe the manner in which they are altered by drugs. It may be necessary to look at mechanisms other than release of amines to explain adequately the scope of action of this potent alkaloid.

Effect of Inorganic Sulphate on Molybdenum Excretion by a Marsupial

Dick and Bull[1] published the first record of a copper–molybdenum interaction in sheep and cattle in which copper stored in the liver is reduced by increasing molybdenum intake. Later, Dick[2] showed that inorganic sulphate has to be ingested with molybdenum before this element can exert a limiting effect on the storage of copper in the liver of sheep Afterwards, Wynne and McClymont[3] found that it was possible to produce experimental hypocuprosis by feeding penned sheep intake levels of copper, molybdenum and inorganic sulphate of the same order as those which occur naturally in pastures of New South Wales, where sheep develop hypocuprosis. Spais[4] has described a similar 'induced' copper deficiency in flocks of sheep grazing on coastal areas of Thessalonika, Greece, where food plants have normal copper but high molybdenum and inorganic sulphate levels.

The quokka, *Setonix brachyurus*, Quoy and Gaimard, is found in a natural population on Rottnest[5], a small island 12 miles west of Fremantle, composed of wind-blown sand (æolionite). Following the work of Moir *et al.*[6], who showed that the quokka has ruminant-like digestion, it was decided to embark on a project to determine whether trace-element deficiencies played any part in the biology of the animal on the island, because, due to their origin, the soils were likely to be deficient, especially in copper and cobalt. Furthermore, it had been found that some animals showed a marked seasonal anæmia which has since been documented by Shield[7].

Analysis of the plants eaten by the quokka on Rottnest has shown that copper-levels are extremely low (usually less than 3 p.p.m. on a dry-weight basis), molybdenum-levels are moderate (up to 8 p.p.m. dry-weight basis) and inorganic sulphate-levels are high (up to 2·3 per cent on a dry-weight basis). The first experimental step was to determine the effect of inorganic sulphate on the excretion of molybdenum. An experiment similar to that used by Dick[8] on sheep was carried out. Two pairs of adult male quokkas, placed separately in metabolism cages, were given food and water *ad lib.* and a 24-hr. collection of urine was made. At the end of this period, blood samples were taken. The animals were then given a daily drench of ammonium molybdate; the total daily intake of molybdenum of each animal from the food and drench was 600 μgm. At the end of a week a 24-hr. collection of urine and a blood sample were taken from each animal. One animal of each pair was then given a drench of ammonium sulphate containing 1·25 gm. sulphate and the other a drench of ammonium chloride containing the same amount of chloride. Daily drenching with molybdate was continued and blood and urine collection was taken for the two following 24-hr. periods. All samples were analysed for copper and molybdenum.

The results of an analysis of variance were only significant ($P < 0.01$) for the changes in blood and urine molybdenum which occurred after drenching with inorganic sulphate. Table 1 shows that in both groups the mean molybdenum-levels of whole blood rose after drenching with molybdate solution for one week. Drenching with sulphate caused a decrease in whole-blood molybdenum-levels to pre-treatment levels in 24 hr. and there was a corresponding increase in the total excretion of molybdenum in the urine for this period. Drenching with chloride had no effect on the excretion of molybdenum in the urine. Blood copper-levels and total copper excreted in the urine of both groups of animals remained unchanged. There was no significant increase in urine volume in the sulphate group after drenching with ammonium sulphate or in the chloride group after drenching with ammonium chloride.

Table 1. Changes in Blood Molybdenum-levels and Total Molybdenum excreted in the Urine induced by a Single Dose of Inorganic Sulphate

(The dotted line indicates the time of drenching with sulphate and chloride solutions)

		Urine volume (ml.)	Blood molybdenum (μgm./ml.)	Blood copper (μgm./ml.)	Urine molybdenum (total μgm.)	Urine copper (total μgm.)
Sulphate group	Day 0	248	0·05	0·66	1·9	7·8
	Day 7	201	0·20	0·70	56·0	6·5
	Day 8	182	0·08	0·64	141·0	8·4
	Day 9	139	0·11	0·65	56·0	6·8
Chloride group	Day 0	201	0·04	0·57	4·1	7·3
	Day 7	135	0·17	0·66	90·0	4·3
	Day 8	215	0·20	0·69	77·5	6·1
	Day 9	141	0·16	0·68	89·2	7·1

The results indicate that inorganic sulphate has an effect on molybdenum excretion in the quokka similar to that in the sheep.

An experiment to test the long-term effect of increased intake-levels of molybdenum and inorganic sulphate on blood copper-levels and the storage of copper in the liver of the quokka is at present being carried out. Preliminary results show that an intake-level of molybdenum and inorganic sulphate comparable to field-levels at Rottnest, exert a depressing effect on blood copper-levels. This work will be published on completion.

I am indebted to Mr. C. A. P. Boundy, Commonwealth Scientific and Industrial Research Organization, Division of Mathematical Statistics, for statistical analyses; to Mr. A. B. Beck, Commonwealth Scientific and Industrial Research Organization, Division of Animal Health and Production, for technical advice, and to Mr. C. J. Geeves for technical assistance

The work reported is part of a programme on marsupial biology under the general direction of Dr. A. R. Main, financed by grants from the Rockefeller Foundation, Commonwealth Scientific and Industrial Research Organization, and University Research Grants Committee of Western Australia.

Minimum Dose of Diethylstilbœstrol required to stimulate the Phagocytic Activity of the Reticulo-Endothelial System

DIETHYLSTILBŒSTROL has been reported previously by Nicol *et al.* [1,2] to have a strong stimulative action on the phagocytic activity of the reticulo-endothelial system, and various steroids having high œstrogenicity have also been shown to have a similar action[3]. The present research was planned to determine the minimum dose of diethylstilbœstrol required to stimulate the reticulo-endothelial phagocytes and to ascertain its relationship to the œstrogenic potential of the substance.

The present experiments were carried out on 75 male white mice (*T.O.* Swiss strain) of 20–28 gm. body-weight. Groups of five animals were used for testing the various doses of diethylstilbœstrol. All the animals of each group received one subcutaneous dose of diethylstilbœstrol in 0·05 ml. of arachis oil daily for six days. The doses of diethylstilbœstrol ranged from 1 × 10^{-6} mgm. to 0·6 mgm. On the eighth day after the commencement of the treatment the phagocytic activity was measured by the rate of disappearance of a known amount of carbon from the circulating blood[4], the procedure used being that described in previous communications[2,3], and the total body phagocytic activity or phagocytic index being denoted by the symbol K.

Twenty of the animals were used as controls and were given 0·05 ml. arachis oil once daily for six days; the phagocytic activity was then measured on the eighth day by the carbon method referred to above. The arachis oil controls showed an average phagocytic index or K value of 15 ± 0·5.

The results of the different doses of diethylstilbœstrol used are shown in Table 1. Compared with the control values, it can be seen that definite stimulation of phagocytic activity does not occur until the daily dose of diethylstilbœstrol rises to 0·1 mgm. Thereafter, although stimulation is maintained, it does not increase in proportion to the dose. In contrast, the dose necessary to induce œstrus is 0·001 mgm. The minimum dose required to stimulate the reticulo-endothelial phagocytes is therefore about 100 times greater than the œstrogenic potential of the substance.

Table 1. EFFECT OF GRADUAL INCREASE OF DOSE OF DIETHYLSTILBŒSTROL ON THE PHAGOCYTIC ACTIVITY OF THE RETICULO-ENDOTHELIAL SYSTEM

Diethylstilbœstrol (daily dose × 10^{-6} mgm.)	Phagocytic index (K value)	Percentage change in body-weight
1	20 ± 2·1	+ 6·8
10	10 ± 1·3	+ 5·9
100	21 ± 2·9	+ 5·2
1 × 10^3	16 ± 1·8	+ 11·6
1 × 10^4	28 ± 1·7	+ 14·3
1 × 10^5	89 ± 13·2	+ 2·0
2 × 10^5	68 ± 21	− 18·5
3 × 10^5	67 ± 7·7	− 11·6
4 × 10^5	141 ± 38	− 8·5
5 × 10^5	96 ± 11·5	− 13·0
6 × 10^5	103 ± 19	− 10·5
Arachis oil controls in 20 animals	15 ± 0·5	—

It is also of interest to note the effect of increasing doses of diethylstilbœstrol on the body-weight of the animals. Generally, small doses increasing to 0·1 mgm. are accompanied by a gain in weight, but with doses above this level the animals constantly lose weight.

In these investigations we gratefully acknowledge financial assistance from the Central Research Fund of the University of London and from the Medical Research Council.

Fall in Hæmatocrit in Sheep after Treatment with Chlorpromazine and Dihydroergotamine

IT was recently shown[1] that the jugular hæmatocrit of sheep often fell considerably (by as much as 24 per cent of the initial value, mean = 12 per cent) when the animals were isolated from alarming environmental stimuli, or were subjected to gentle restraint ('holding') and soothing for 15–30 min., and that it fell regularly and to an even greater extent (up to 39 per cent of the initial value, mean = 30 per cent) during anæsthesia by pentobarbitonum. Evidence was obtained that these phenomena are a consequence of splenic relaxation, passive filling of the spleen, and segregation therein of an increased fraction of the total red cell mass in a state of dynamic equilibrium with the circulating blood. The remarkable fall in hæmatocrit after 'holding', which we view as emotional or psychological tranquillization leading to diminution of the sympatho-adrenal flux from the cerebral cortex, suggested that this might also occur as a result of pharmacological tranquillization by means of ataractic agents.

This has proved to be so. Intravenous injection of chlorpromazine (0·46–0·7 mgm./kgm.) was followed by rapid hæmatocrit fall, reaching within 60 min. minimum values which were 30 per cent less than the initial value and followed by gradual return to pre-injectional levels after some hours. Plasma specific gravity changes indicated that plasma dilution through water shift accounted for a small part of the hæmatocrit fall; when hæmatocrits were adjusted to eliminate the contribution of this factor it was found that the relative numbers of circulating erythrocytes in the jugular blood fell by 26 per cent. In splenectomized sheep erythrocytes in the jugular blood fell by only 3–4 per cent. Furthermore, in a sheep prepared on the previous day with ^{51}Cr-marked red cells, hæmatocrit fall and gradual return, following injection of chlorpromazine, were mirrored by reciprocal increase and gradual return of gamma-radiation surface counts over the splenic region. It therefore appears that the hæmatocrit fall in intact sheep after chlorpromazine is due mainly to increased retention of red cells in the spleen.

Chlorpromazine was shown to inhibit hæmatocrit rise after adrenaline or *nor*adrenaline intravenous injection. Inhibition was also demonstrated after previous intravenous injection of 'Dibenamine' (20 mgm./kgm.); but this adrenergic-blocking agent caused only a minor (3 per cent) decrease of hæmatocrit. On the other hand, after intravenous injection of dihydroergotamine (14–168 μgm./kgm.), with which inhibition of hæmatocrit rise after the two sympathomimetic catechol amines was also demonstrated, hæmatocrit fell quickly and profoundly (up to 24 per cent decrease), whereas in a splenectomized sheep injection of 1,680 μgm./kgm. was followed by a trivial fall (3 per cent decrease). However, this substance is known to have marked central effects[2,3] in addition to its adrenergic-blocking effects, whereas the adrenergic-blocking activity of 'Dibenamine' is more specific and it has little central effect[4]. Furthermore, intravenous injection of pentobarbitonum sodium, which prevents sympatho-adrenal discharge by blocking nervous impulses within the central nervous system[4], was followed by moderate but slow hæmatocrit fall (progressive 10–12 per cent decrease within 3 hr.) when given in a dose (10 mgm./kgm.) sufficient to cause mild sedation accompanied by muscular inco-ordination. It therefore appears that the splenic relaxation in sheep after chlorpromazine may be due mainly to central effects, and predominantly to its ataractic properties, causing emotional indifference to otherwise alarming environmental stimuli, rather than to direct adrenergic-blocking effects within the spleen.

Fall in hæmatocrit (18 per cent decrease) and its virtual abolition by splenectomy was also demonstrated in sheep after intramuscular injection of mepazine (2·3 mgm./kgm.). The hæmatocrit fall after chlorpromazine injection reported in dogs[5] is doubtless also due to increased retention of red cells in the dilated spleen. This effect of chlorpromazine and mepazine, and probably of many other tranquillizing drugs, may be expected in many animals in which the red-cell storage function of the spleen is important.

PLANT PHYSIOLOGY

Auxin-induced Methylation in Maize

The transfer of methyl groups from methionine to the hot-water-soluble fraction of *Avena* coleoptile cell walls is increased by indoleacetic acid (IAA)[1]. Unlike most effects of indoleacetic acid, this increase occurs even when all expansion is osmotically prevented. Thus this process appears to be directly controlled by auxin and may constitute a portion of the mechanism whereby auxin induces elongation. If this were so, it would be expected that auxin would influence this transfer in all tissues which show an auxin-growth response. Maize coleoptile and mesocotyl tissues have now been examined for the presence of auxin-induced methylation.

Avena coleoptile sections for use as controls were obtained in the manner of Ordin *et al.*[1]. Sections of maize coleoptile and mesocotyl were obtained as follows. Maize seedlings were germinated in moist sand and allowed to grow in the dark for about 90 hr. Mesocotyls of 2·5–3·5 cm. in length were then selected and one 5-mm. section was excised from each mesocotyl using a double-bladed cutter. The apical incision was 1 mm. below the node Coleoptiles of 1·5–2·0 cm. in length were selected at the same time and a 5-mm. section was excised after removal of the apical 3 mm. The central leaves were removed from the coleoptile sections of *Avena* and maize. Each experimental treatment contained sufficient material to give about 10 mgm. dry cell wall. All manipulations were carried out under a weak red light.

Sections were incubated in 0·0025 *M* potassium maleate solutions (*p*H 4·8), ± 5 p.p.m. indoleacetic acid. The methyl donor used was methionine-methyl labelled with carbon-14 (Amersham, 0·145 mc./mgm.) in a concentration of 2–3 × 10^{-5} *M*. At the end of the incubation period, the amount of saponifiable methyl groups in the hot-water-soluble pectin was determined using the methods of Ordin *et al.*[1].

Table 1. The Effect of Auxin on the Transfer of Methyl Groups from Methionine-^{14}C to Wall Pectin of Various Tissues

Material	Methionine administered (c.p.m.)	Time (hr.)	Growth-rate IAA/control	5 p.p.m IAA	MeOH-^{14}C/10 mgm. cell wall (c.p.m.)
Avena coleoptile	3·5 × 10^6	5	2·5	±	1,145 620
Maize coleoptile	2·9 × 10^6	4	2·1	±	3,210 2,010
Maize mesocotyl	3·85 × 10^6	20	2·0	±	1,930 1,945

The results are shown in Table 1. An auxin treatment causes an increase in the transfer of methyl groups from methionine to wall pectin in maize coleoptiles as well as in *Avena* coleoptiles. No such increase occurs in maize mesocotyls even though growth is doubled by auxin The lack of auxin-effect may mean that transfer of methyl groups to hot-water-soluble pectin is not a necessary part of the mechanism of auxin-induced growth. Alternatively, since it is known that other substrates such as formaldehyde can furnish the methyl groups to pectin (Sato, C., unpublished work), this result may only be a reflexion of a marked preference of maize mesocotyls for some substrate other than methionine as the source of pectin methyl groups.

This work has been carried out in the laboratory of Prof. T. A. Bennet-Clark at the Botany Department, King's College, London, and has been supported by post-doctoral fellowship *CF*-7341-*C* from the National Cancer Institute, United States Public Health Service. I wish to express my appreciation to Prof. Bennet-Clark for his help and encouragement and to Mrs. M. W. Ware for advice on methods of obtaining maize coleoptile and mesocotyl sections.

Certain Mitotic Effects of Kinetin, Gibberellic Acid, Indoleacetic Acid, and Maleic Hydrazide on the Root of *Allium cepa*

Treatment of intact roots of *Allium cepa* with kinetin (6-furfurylaminopurine) has been reported by Guttman[1] to cause an increase in the rate of division of the cells of the root tip. She found a similar stimulatory activity of kinetin in promoting division of *Paramecium caudatum*[2].

Guttman made her studies of *Allium cepa* roots on random fields of squash preparations. The following is a report of similar studies in which the counts of mitotic figures were made on serial longitudinal sections of the root tips. The results indicate a markedly inhibitory effect on mitosis when kinetin is applied to intact roots in the same manner and in similar concentrations.

Table 1 shows the mean number of mitotic figures present in all tissues of the distal 5 mm. of the root tip, in 10-μ sections from the centre of five roots which had been treated with 1 p.p.m. and with

K, Kinetin; GA, gibberellic acid; IAA, indoleacetic acid; MH, maleic hydrazide

10 p.p.m. kinetin for the times indicated in Table 1. The value given is the average of twenty counts for each treatment.

Roots were also treated with 1 p.p.m. and with 10 p.p.m. gibberellic acid, and with similar concentrations of indoleacetic acid and maleic hydrazide, as well as with combinations of all of these in all possible pairs. Results are summarized in Table 1.

In their review of the literature on the gibberellins, Stowe and Yamaki[3] listed no studies of the effect of cell division on intact roots, but it has recently been shown to stimulate cell division in shoots (for example, Sachs and Lang[4]). In the present investigation, roots treated with gibberellic acid showed initial depression of mitosis followed by an after-effect of stimulation of mitosis. The pattern of mitotic activity was similar to but not so pronounced as that seen after treatment with indoleacetic acid. The effects of indoleacetic plus gibberellic acids were not additive, however. At 10 p.p.m., gibberellic was inhibitory to mitosis and after 3 days the roots appeared dead.

Roots treated with indoleacetic acid at a concentration of 1 p.p.m. show inhibition of their longitudinal growth for about 3 days, during which time the characteristic bulbous swelling or 'c-tumour' is produced just proximal to the root tip. After about 3 days, elongation of the root is resumed, and some workers have noted that the rate of elongation may then exceed that of control roots (for example, Thimann[5]). In the present work it was found that mitotic activity exactly paralleled this characteristic response in the rate of total elongation of the root. Initially there was inhibition of mitosis, followed by a return to the level of the control at about 3 days. At 5 days, during the time when there is stimulation of gross elongation, the number of mitotic figures seen also exceeded that of the control. At 10 p.p.m., indoleacetic acid markedly inhibited mitosis, and there was no later release from the inhibition. After 3 days the roots appeared dead.

Interactions of indoleacetic acid with each of the other substances used here have been reported. No consistent reversal or enhancement of the initial effect of indoleacetic acid was seen here, but only when this acid was combined with gibberellic acid was the tendency to an after-effect of stimulation seen.

Maleic hydrazide has been reported to reverse the effect of indoleacetic acid in various test reactions (for example, Leopold and Klein[6]). In the present work it was always inhibitory, and it did not reverse the action of any of the auxin-like substances used.

Some workers have reported the presence of mitotic aberrations in plant material treated with maleic hydrazide, whereas others have not found them. McLeish[7] found no chromosome breaks after treatment of onion root tips with maleic hydrazide, and Greulach and Atchison[8] found no mitotic aberrations in onion root tips so treated. In the root tips treated with 10 p.p.m. maleic hydrazide in the present investigation, about one-third of the mitotic figures seen showed aberrations, including fragmentation and changes which gave the chromosomes a beaded appearance.

Clowes[9] has suggested that there is a 'quiescent centre' in the area of the apical initials of some roots, in which the cells normally rarely or never divide. It was noted here that mitotic figures were very rare in the centre of the apical initial area of *Allium cepa*.

RADIOBIOLOGY

Isolation of Radioactive Vitamin B_{12} from Incubation Mixtures containing Glycine-2-^{14}C and Turkey Liver Homogenates

STUDIES carried out with tracer techniques indicate that α-carbon of glycine gives rise to a single-carbon moiety at the oxidation-level of formaldehyde and this combines with α-carbon of another molecule of glycine to give rise to serine[1]. However, no free formaldehyde *per se* but formic acid has been isolated from the reaction mixtures containing liver homogenates, glycine-2-^{14}C or serine-3-^{14}C[2,3]. Both *in vitro* and *in vivo* experiments, compounds of the type of hydroxymethyltetrahydrofolic acid are produced from glycine and serine[4,5] and this is strong indirect evidence for the formation of formaldehyde from α-carbon of glycine or β-carbon of serine.

Vitamin B_{12} appears to be involved in the biosynthesis of serine from glycine[6] in turkey liver homogenates and also reacts with formaldehyde to form complexes *in vitro*[7].

Table 1. INCORPORATION OF RADIOACTIVITY FROM GLYCINE AND SERINE INTO FORMALDEHYDE AND VITAMIN B_{12}

Amino-acid	Specific activity (c p.m./m.mole) ($\times 10^6$)	Vitamin B_{12} added (mgm.)	Incubation time (hr.)	Total formaldemethone isolated (mgm.)	Specific activity of $H^{14}CHO$ (c.p.m./m.mole)	Total activity of isolated vitamin B_{12} (c.p m./mgm.)
Glycine-1-^{14}C	3 6	20	4	33	0	0
Glycine-2-^{14}C	3 5	20	18	25	3,250	10
	3 5	0	18	26	2,520	—
Glycine-2-^{14}C	2·3	20	12	16	1,950	8
	2 3	0	12	32	1,200	—
Serine-3-^{14}C	5 2	20	4	32	2,200	1

The production of free formaldehyde from glycine in reaction mixtures containing turkey liver homogenates has been investigated and an attempt has been made to confirm the formation of vitamin B_{12}-formaldehyde complexes from these reaction mixtures.

Turkey poults fed diets deficient in vitamin B_{12} were killed at the age of 3 weeks and their livers were homogenized in cold conditions and frozen. An approximately known volume was used in each experiment. The buffer, *p*H 7·6, contained 11·98 gm. crystalline disodium hydrogen phosphate and 1·02 gm. potassium dihydrogen phosphate per litre. Serine (DL-serine-3-^{14}C) with an activity of 929 μc./m.mole was obtained from Nuclear, Chicago, Ill. The dimedon solution contained 0·4 gm. dimedon (5,5-dimethyl-1,3-*cyclo*hexanedione) per 100 ml. water. Glycine-2-^{14}C with an activity of 1 mc./m.mole was obtained from Research Specialities Co., Berkeley, Calif. Glycine-1-^{14}C had an activity of 1·59 mc./m.mole and was supplied by New England Nuclear Corp., Boston, Mass. 1 ml. of 37 per cent formaldehyde solution was diluted to 50 ml. with water; semicarbazide solution, 0·4 per cent in water; glycine and serine solutions, 20 mgm./ml.; trichloracetic acid, acetic acid and sodium hydroxide solutions, 10 per cent.

The method used for the isolation of formaldehyde was essentially the same as described by Frisell and Mackenzie[8]. Each of the two flasks used in these experiments contained the following solutions: 2 ml. buffer, 0 5 ml. inactive glycine, 3 ml. radioactive glycine, 1 ml. formaldehyde and 1 ml. semicarbazide. One of the flasks also contained 20 mgm. vitamin B_{12}. Then 2 ml. of liver homogenate was added and flasks were covered with 'Parafilm'. After incubation at room temperature for 4–18 hr., 6 ml. of trichloracetic acid solution was added to each flask and the solutions were filtered through Whatman filter paper No. 42. The protein on the filter paper was further washed with 5 per cent trichloracetic acid solution until practically free from the colour of vitamin B_{12}. The solution was neutralized with sodium hydroxide solution, using an internal or external indicator as necessary, and again made just acidic with acetic acid solution. The solutions were filtered again; 25 ml. of dimedon solution was added to each flask and kept overnight in the refrigerator when formaldemethone separated out (mol. wt. 292). This was filtered, washed with water and recrystallized from dilute alcohol after treatment with carbon to a constant activity.

In this way, experiments were tried with glycine-1-^{14}C, glycine-2-^{14}C and serine-3-^{14}C.

Vitamin B_{12} was isolated from the solutions after filtration of formaldemethone essentially by the method of Fantes *et al.*[9]. 'Norit' carbon was used to adsorb vitamin B_{12} and the carbon was washed with 200–300 ml. of water and then with 50 ml. of 2 per cent phenol solution and again with water. Vitamin B_{12} was eluted from carbon with hot 65 per cent ethanol. The alcoholic solution was concentrated under reduced pressure, and residue was diluted with 50 ml. water and again adsorbed on 'Norit' carbon. The washing of 'Norit' and elution of vitamin B_{12} was repeated. The alcoholic solution was again evaporated to dryness under reduced pressure and the residue was dissolved in the minimum amount of water and acetone was added until a turbidity appeared. The solution was left in freezer overnight and crystals of vitamin B_{12} were obtained. Crystallization of vitamin B_{12} was repeated three more times.

Vitamin B_{12} was dissolved in dilute alcohol and streaked as a band on Whatman filter paper No. 2*MM*; glycine and serine were also spotted on the paper and it was chromatographed for 48–72 hr. in ascending butanol/acetic acid/water, 4 : 1 : 1. After drying the paper, the section of it containing glycine or serine was sprayed with ninhydrin and developed. The amino-acids moved far ahead of vitamin B_{12} and sections of paper corresponding to vitamin B_{12} were cut and eluted with water. The eluate was evaporated in polyethylene planchets and the radioactivity was determined.

Samples of formaldemethone were converted to carbon dioxide by wet combustion, precipitated as barium carbonate, filtered on filter paper disks and counted under a windowless gas flow counter. Proper corrections were made for self-absorption.

In some cases, the samples were plated in infinitely thin layers on polyethylene planchets and counted. No correction was made for self-absorption.

Preliminary experiments were carried out in which vitamin B_{12} was allowed to react with glycine-1-^{14}C, glycine-2-^{14}C and formic acid in absence of any liver homogenates. The procedure has been reported earlier[7]. In no case was any radioactivity found to be associated with vitamin B_{12}. This observation is in sharp contrast to the reaction of formic acid with tetrahydrofolic acid, where formyltetrahydrofolic acid is obtained.

Vitamin B_{12} isolated from reaction mixtures containing glycine-2-^{14}C, or serine-3-^{14}C, vitamin B_{12} and liver homogenates was found to be radioactive (Table 1). No radioactivity was associated with vitamin B_{12} incubated with glycine-1-^{14}C and liver homogenates.

Glycine-1-^{14}C is metabolized to yield labelled carbon dioxide and this is not exchanged with any carbon of vitamin B_{12}. For this reason, the vitamin B_{12} isolated from the reaction mixture was non-radioactive.

On the other hand, glycine-2-^{14}C and serine-3-^{14}C both yield labelled formaldehyde, as is clear from Table 1, where the specific radioactivities of formaldehyde isolated are given. Previous workers had failed to obtain any free formaldehyde because it might be easily oxidized to formic acid. The addition of some inactive formaldehyde helped to trap radioformaldehyde produced. If no liver homogenates were used, about 69 mgm. of formaldemethone was isolated. But with liver homogenates about 32 mgm. of this compound was isolated; the remaining formaldehyde must have been oxidized.

Also, formaldehyde isolated from the reaction mixtures containing vitamin B_{12} appeared to be slightly more radioactive than without it. This radioformaldehyde may have combined with vitamin B_{12} to give vitamin B_{12}–formaldehyde complexes. That radioactivity in vitamin B_{12} was not due to any chance contamination with amino-acids was proved by paper chromatography.

No definite information can be given about the molar ratios of vitamin B_{12} and formaldehyde in these complexes. In studies with glycine-2-^{14}C, each mole of vitamin B_{12} appears to be in combination with 4 or more moles of labelled formaldehyde. This calculation is based on a molecular weight of vitamin B_{12} of 1,356. But the ratio for the complex isolated from serine-3-^{14}C studies is very different. Here 2 moles of vitamin B_{12} appear to be in combination with 1 mole of labelled formaldehyde.

The isolation of vitamin B_{12}-formaldehyde complexes both *in vitro* and in present experiments suggests that these should be further investigated with respect to any role in serine–glycine interconversions.

We are indebted to the U.S. Public Health Service for a grant (*C*–3992) which enabled us to carry out this study. Thanks are also due to Merck Sharp and Dohme, Rahway, N.J., and Chas. Pfizer and Co., Inc., Terre Haute, Ind., for the gifts of crystalline vitamin B_{12}.

A Pitfall in High Specific Activity Tracer Studies

IN experiments on the effects of radiation on the process of deoxyribonucleic acid synthesis in mammalian cells it was noted that, in some systems, apparent 'radiosensitivity' of the synthetic process varied with the amount of isotopic 'label' administered.

Ehrlich ascites cells were washed and resuspended in a medium of 50 per cent supplemented Hank's solution and 50 per cent human serum (10^7 cells per ml. medium). Half the culture vessels served as controls and the other half received 2,000 rads of 250 kV. X-rays. Immediately after radiation, tritium-labelled thymidine was added to the vessels as follows: (1) one half of each group, control and irradiated, received 0·5 µc./ml. of specific activity 360 µc./µmole; (2) the other half 5·0 µc./ml. of specific activity 36 µc./µmole, that is, the total amount of thymidine, was increased from 10^{-3} µmole in (1) to 10^{-1} µmole in (2) per culture vessel. All the vessels were then incubated at 37° C. for 2 hr. At the end of the incubation period smears were made for high-resolution autoradiography and grain counting over 500 labelled cells; alternatively, planchettes were prepared for counting total radioactivity of washed cells[1,2]. All experiments were performed with quadruplicate samples.

Under the above conditions, a regular depression of the average grain count or total radioactivity of the cells was noted in the first group, the depression being 50–53 per cent of the control value, while in the second group, the depression was rarely significant, the maximum depression being 12 per cent of the control value.

It was concluded, therefore, that irradiated Ehrlich ascites cells may release deoxyribonucleic acid precursors which are capable of diluting the added label. The dilution to 50 per cent of 10^{-3} µmole of tritium-labelled thymidine indicated a release of compounds equivalent to 10^{-3} µmole of thymidine: if the released compound was thymidine, this would correspond to about 1–2 per cent of the deoxyribonucleic acid thymidine content of 10^7 cells.

No such pool dilution was noted with human bone marrow cells *in vitro*, nor (in preliminary experiments) with mouse thymus cells *in vivo*. These investigations caution workers against the indiscriminate use of 'true tracer amounts' of labelled materials, against the use of high specific activity thymidine in particular, unless previous studies have established the absence of a pool dilution effect.

These experiments were supported by a grant from the Medical Research Council. One of us (R. J. B.) is British-American Exchange Fellow of the American Cancer Society.

BIOLOGY

Control of African Wild Animals

IN the past the control of wild animals, where these conflicted with human interests, has been through destruction, and the rate of destruction has increased greatly in recent years. The possibility of the virtual elimination of the wild ungulates from Africa is a matter for concern if only on the following grounds: (1) The value of these animals as providers of meat under a system of game management and selective cropping. (2) The as yet unassessed effect of the disruption of the natural balance on soil and flora, especially with regard to erosion, desiccation and increase in bush density. (3) The danger of extinction of species and sub-species. (4) The value of these animals as a tourist attraction.

We have become interested in developing effective techniques for transporting animals to areas where the conflict between man and animal is less acute, and where their chances of survival are greater. Prolonged attempts over the years to catch adult animals in appreciable numbers by driving, netting and trapping have failed.

Drugs have been used successfully for catching wild deer in the United States[1] for the purposes of study. This technique has been extended to African species to mark them in order to study changes in population, growth-rates and movement-patterns. Considerable success in this direction has led us to use the method as a preliminary stage in pilot experiments for moving animals to other areas. This work is creating much interest in other parts of Africa and abroad, and demands for information have induced us to publish this early report.

An immobilizing drug is delivered to the animal by a variety of means, and injected intramuscularly. Following capture a tranquillizing drug is then administered before the effects of the first drug have worn off. Transport of the animal then follows.

Most of our results have been obtained using succinyl choline chloride as the immobilizing agent, and Table 1 shows the doses employed.

Table 1. EFFECTIVE DOSES OF SUCCINYL CHOLINE CHLORIDE

Species	Mgm./kgm body-weight Male	Female	No of animals effectively immobilized
Adenota kob thomasi	0·35	0·35	50 (approx.)
Giraffa camelopardalis rothschildi	0·20	0·17	8 (in two doses given at 30 min intervals)
Equus grevyi	0·19	—	2
Kobus defassa ugandae	0·35	—	8
Alcelaphus buselaphus lelwel	0·30	—	1
Diceros bicornis bicornis	—	0·13	1 (must be given in neck region)

Small-scale trials have been made in transporting kob (antelope) from the Lugari area, where the sole remaining herd of Kenya kob now exists, and black rhinoceros from the Makindu area, where land is to be reclaimed from bush. Very shortly we hope to make a similar pilot experiment to move some of the few remaining Rothschild giraffe (only about 200 of which are in existence in the world) out of the farming area where they now reside to marginal grazing land in West Suk.

Much more work is required before this method can be applied on a large scale. As with most drugs producing paralysis, the margin between the effective and lethal doses is small. We are investigating a wide range of drugs in order to determine the most suitable for a given species. With improved techniques in the delivery of drugs and their administration, new opportunities for scientific research and practical wild life management will develop. Although killing of animals must continue under systems of cropping and a degree of control work by shooting will continue to be necessary, it is hoped that the methods of immobilizing and transporting animals that are being evolved will contribute materially to the preservation and proper use of wild life in Africa.

We are indebted to the members of the Uganda and Kenya Game Departments for their co-operation and provision of equipment, Palmer Chemical and Equipment Co., Ltd., for gifts of equipment, and Messrs. Burroughs Wellcome, Ltd. (East Africa), for donation of the succinyl choline chloride.

Inactivation of Acid Phosphatase in Human Prostatic Homogenates *In vitro*: Role of Calcium

IN the course of metabolic experiments carried out on homogenates prepared from fresh human adenomatous prostates, we have observed that incubation of such homogenates at 37° C. and *p*H 7 in *tris* buffer containing calcium chloride (0·02 *M*) resulted in a rapid loss of phosphatase activity averaging 44 per cent after 3 hr. in 32 experiments. When adenosine triphosphate (0·015 *M*) was added at the beginning of the incubation period, the loss of activity was reduced to an average value of 5 per cent under the same experimental conditions. Addition of adenosine triphosphate during or at the end of the incubation period resulted in complete regeneration of the acid phosphatase activity on further incubation (Fig. 1). We have observed also that adenosine triphosphate could be replaced by sodium diphosphate or ethylenediamine tetraacetic acid (versene) with identical results.

Loss of acid phosphatase activity did not occur or was minimal in prostatic homogenates prepared without the addition of calcium chloride.

These experiments indicate that calcium ions reversibly inactivate the acid phosphatase activity of incubated human prostatic homogenates. Reversal of the process occurred when calcium ions were removed by the addition of phosphate or other

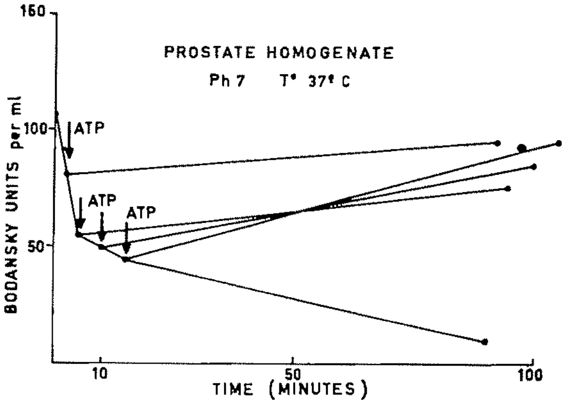

Fig. 1. Effect of adenosine triphosphate on inactivation of acid phosphatase

calcium-binding compounds. This fact, which apparently has not been described up to the present, should be taken into account in the evaluation of fluctuations of acid phosphatase in human serum, whether these fluctuations are spontaneous or associated with certain forms of therapy.

Influence of Ejaculation Frequency on the Time required for Sperm Formation and Epididymal Passage in the Bull

RECENT experiments have shown that in bulls injected with radioactive phosphate (phosphorus-32), 48–50 days elapse from the moment of injection to the time when radioactive phosphorus appears in the deoxyribonucleic acid of ejaculated spermatozoa[1,2]. This is the period of time required for the formation of spermatozoa in the testes and their passage through the epididymides. The purpose of the present study was to ascertain whether and to what extent this period can be influenced by varying the frequency of ejaculations.

Three bulls ('18', *F* and *Ph*) were used for the experiments, all of the Red Danish milk breed. Labelled phosphate was administered intramuscularly, the dose varying from 5 to 20 μc. phosphorus-32 per kgm. body-weight. Semen was collected by means of an artificial vagina. Throughout the experimental periods as well as during the extended periods preceding and following each experiment the semen was examined for sperm concentration, motility, and the presence of abnormal forms. No deviation from the normal semen picture was encountered in any of the injected animals. The fraction containing deoxyribonucleic acid was separated from the ejaculated spermatozoa using a modification of the Schmidt–Thannhauser method[3] and analysed for phosphorus content and radioactivity. The experimental periods were of 100–130 days duration.

The first series of experiments was carried out on bull '18' which in the previously reported investigation[1] was used at a rate of two ejaculations a week This bull was injected with phosphorus-32 on November 20, 1957. During a period of 45 days prior to the injection no ejaculates had been collected, thus allowing ample time for the establishment of a proper reserve of sperm in the epididymides. Single ejaculates were collected on days 13, 43, 47 and 50 after the injection. The first labelled deoxyribonucleic acid was encountered in the spermatozoa ejaculated on the fiftieth day. Then, on May 1, 1958, the same bull was injected again. However, during a period of 40 days prior to this injection the bull had been subjected to very frequent semen collections so as to deplete the epididymal store as much as possible. Maximal sperm output was also maintained during the actual experimental period by collecting the semen almost every day. Nevertheless, the first semen sample to contain sperm with labelled deoxyribonucleic acid was that obtained 48 days after the injection of radioactive phosphate.

The second series of experiments was carried out on bulls *F* and *Ph*, mainly to find out if age of the animal or season of the year can influence the time required for sperm formation and maturation.

For a period of 1½ months preceding the actual experiments, bulls *F* and *Ph* had been subjected to collections at a rate of 2–3 a day and 1 a week, respectively. Phosphorus-32 was injected to both bulls on November 5, 1958, and then again 76 days later. The rate of collections during the experimental period of 105 days after the first injection was the same as during the pre-experimental period. On the one hundred and sixth day after the first injection, that is, on the thirtieth day after the second injection, the collection procedures were reversed, that is, from now onwards bull *Ph* was used for collection 2–3 times daily, while bull *F* was used only once a week. Moreover, just prior to the time when this reversal was instituted the sperm reserve of *Ph* was quickly depleted by performing on the animal an exhaustion test in the form of 14 rapidly succeeding collections. Table 1 illustrates the ejaculation schedule followed for the bulls *F* and *Ph*.

Table 1. EJACULATION SCHEME FOR THE BULLS *F* AND *Ph*

Bull (No.)	Injection of phosphorus-32	Rate of ejaculations during periods corresponding in length to :	
		Spermatogenesis	Epididymal passage of sperm
F	first	2–3 daily	2–3 daily
	second	2–3 daily	1 per week
Ph	first	1 per week	1 per week
	second	1 per week	2–3 daily

The aims of planning the experiment in the way outlined above were as follows. Constant frequency of collection was maintained during periods corresponding in length to the time necessary for the completion of spermatogenesis since one could scarcely expect the spermatogenesis, as distinct from sperm passage through the epididymis, to be affected by the number of spermatozoa withdrawn from the animal by means of semen collections. During the remaining periods, however, which would correspond in length to the time required for the passage of sperm, the frequencies were varied deliberately. Thus if varying ejaculation frequencies could affect the epididymal passage of spermatozoa at all, the appearance of labelled deoxyribonucleic acid in ejaculated sperm would occur at different times from the moment of injection according to the respective rates of ejaculations. In rams[4] and rabbits (Koefoed-Johnsen, H. H., and Foote, R. H., unpublished results) it has been previously found that labelled spermatozoa were present in the head of the epididymis about 30 days after the administration of the radioisotope. It was thought reasonable to apply to bulls a similar figure although, admittedly, this period could be possibly longer, but in any event not shorter, in the bull.

All results obtained on the three bulls are given in Table 2. This table shows the time interval between the phosphorus-32 injection and the first appearance in ejaculated semen of spermatozoa containing labelled deoxyribonucleic acid. It indicates also the average age of spermatozoa in the ejaculates as assessed by the time required by ejaculated spermatozoa to reach the maximum of labelling (average

F	12	May 17, 1958	5	22	—	39·5	24·4	15·2	48	—
F	18	Nov. 5, 1958	8	71	50	122·9	77·8	45·1	47	55
F	21	Jan. 20, 1959	7	79	5	93·0	60·1	32·9	50	66
Ph	30	Nov. 5, 1958	8	5	6	79·9	29·7	50·2	51	63
Ph	33	Jan. 20, 1959	10	5	67	244·5	76·7	167·7	49	58

values). Table 2 includes also results for the number of ejaculates obtained during definite periods of time and the number of spermatozoa ejaculated during the same periods. The general conclusion which can be drawn from these results is that the period of time required for the appearance in ejaculates of spermatozoa with labelled deoxyribonucleic acid is remarkably constant irrespective of the frequencies of ejaculations. The average age of ejaculated spermatozoa, however, varies according to the frequency of collections; thus, infrequent collections will result in a higher average age of the spermatozoa in ejaculated semen, indicating that the sperm have been stored in the cauda epididymidis for a longer period of time than in the case of frequent ejaculations.

Abnormalities in the Urinogenital System of the Common Dogfish

ABNORMALITIES of the urinogenital system of the common dogfish (*Scyliorhinus caniculus*) have hitherto been regarded as infrequent[1–3]. It is therefore of interest to note that in the past academic year three abnormal dogfish have been found by this department.

Case 1. This dogfish was 14·3 in. long (36·3 cm.) from the tip of the snout to the posterior end of the first dorsal fin. The external appearance was that of a young male. The right clasper was 3·5 cm. long, and the left clasper 2·9 cm. long. The united mesial border of the pelvic fins[3] was notched to a depth of 9 mm. So far as can be judged, the structure of the siphon was normal. The appearance of the mouth[3] was typically male.

Internally the urinogenital ducts were symmetrical and hermaphrodite. Superficially, the urinary and Wolffian ducts presented the normal appearance of a young male, and the seminal vesicles were dilated to a diameter of 7 mm. There was, however, no sperm sac. The main urinary duct on each side opened into the urinary papilla, but the seminal vesicles opened into the dorsal wall of the base of each oviduct.

On each side the Müllerian duct extended from the common oviducal aperture to the cloaca. The length of the common oviducal aperture was 9 mm. There was no indication of an oviducal gland. Throughout the major part of its length the diameter of the Müllerian duct was 2·5 mm., and the lumen was filled with a clear mucus. The posterior part of the Müllerian duct had an average diameter of 5 mm., so this part was apparently dilating, as would be expected in a young female prior to copulation. The right Müllerian duct was closed at the cloaca, and sealed to the lateral side of the urinary papilla. The equivalent region of the left side was damaged by student dissection, but is believed to have been in the same condition originally.

The left gonad had the external appearance of a functional testis. Microscopical examination revealed that proliferation of spermatogonia was occurring in the seminiferous tubules, but that maturation of spermatozoa was not occurring. The right gonad was less well developed, and had the appearance of an immature ovary. Oocytes as big as 2 mm. in diameter were visible in one part.

Case 2. The dorsal fin had been removed with the tail, but the animal was 13 in. long (33 cm.) from the tip of the snout to the posterior end of the pelvic fin. In other words the animal was slightly longer than case 1. The external appearance was not so typically male. The left clasper only was present, and was only 2 cm. long. The pelvic fins were completely separated posteriorly as in a typical female. There was no indication of a siphon having been present.

Internally, as in case 1, the urinogenital ducts were bilaterally hermaphrodite, and the sperm sac was absent. Again the urinary ducts presented a typical male appearance; but in this case they opened into the dorsal wall of the oviduct, and no urinary papilla was present. The seminal vesicles were indicated, but were only 3 mm. in diameter. As in case 1 they opened into the dorsal wall of the base of the oviduct. The Müllerian ducts extended the whole length of the body cavity, with an average diameter of 2 mm., and dilating in the oviducal gland region to 6 mm.

The left gonad had the external appearance of an abnormally short testis. The right gonad had the appearance of an immature ovary.

Case 3. A new pectoral steak was found to contain both vasa deferentia and an immature ovary with oocytes. The rest of the animal was not located.

Formation of New Wool Follicles in the Adult Sheep

It has generally been held that the formation of new hair follicles from the epidermis does not occur after the adult complement has been established. Evidence to the contrary was published by Ribbert[1] as early as 1904, and more recent work in this field has confirmed that new hair follicles can in fact develop from adult epidermis[2-5]. This phenomenon has not, to our knowledge, been reported in the sheep and the present observations, describing the formation of new wool follicles in adult animals, were made by chance during the examination of unsuccessful homografts.

Pieces of skin (about 3 mm. × 3 mm.) from 49–80 day Merino sheep fœtuses were grafted on to the abdominal walls of their mothers, the graft beds having been prepared by the removal of pieces of full-thickness maternal skin. When these sites were biopsied, 15–62 days after grafting, and examined microscopically, the presence of immature follicles was noticed. Neither the age of fœtal skin when grafted, nor the time that elapsed between application of the grafts and sampling of the site, seemed to have influenced the occurrence of new follicles. They were considered to be maternal and not fœtal in origin, due to the presence of features which could only be associated with adult skin, for example: (*a*) mature follicles, including bundles of secondaries; (*b*) shedding and regenerating follicles; and (*c*) fibre remains in the dermis.

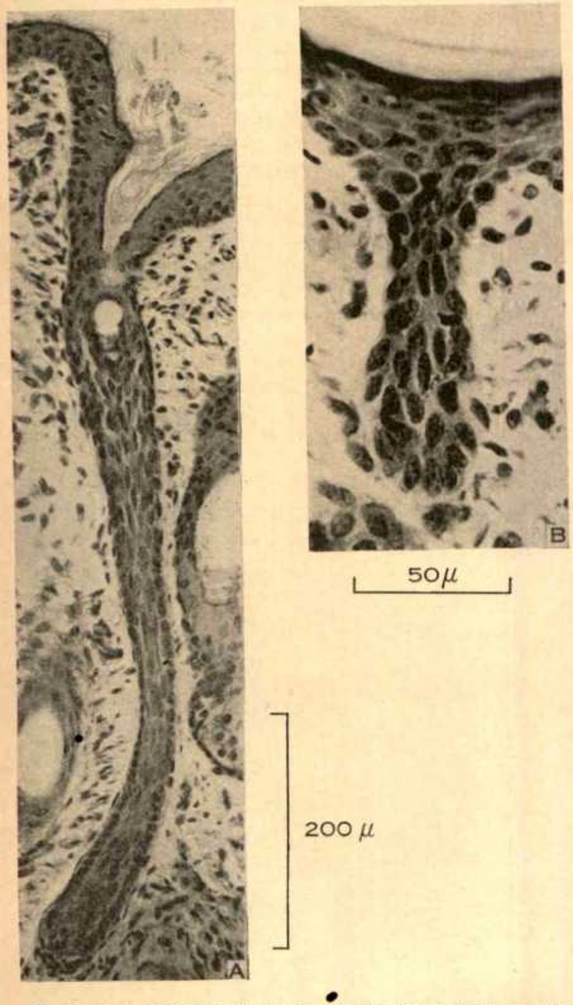

Fig. 1. Longitudinal sections of new original wool follicles on the abdomen of an adult sheep. *A*, New follicle with a dermal papilla; *B*, new follicle at an earlier stage without dermal papilla cells

Both regenerating and new wool follicles were observed. The former developed from below the sebaceous gland-level of a resting follicle and were associated with original dermal papillæ. This process in sheep has been briefly described by Burns[6]. New follicles were of two kinds, derived and original; derived were formed from the neck region of existing follicles, and original from the epidermis, in a manner similar to that described in the sheep fœtus[7]. Their papillæ also, if present, were newly formed.

There was considerable variation in the stages of development reached by both original and derived new follicles. In their early forms they appeared as slender epidermal downgrowths, generally, though not invariably, associated with dermal papilla cells (Fig. 1*A* and *B*). Sebaceous glands and hair canals had been formed in the more advanced follicles, but no sweat glands were observed. The most advanced follicle contained a fibre about to emerge above the skin surface. However, since the majority of the new follicles were in early stages of development (prior to the formation of the hair cone), it cannot certainly be claimed that this neogenesis would have culminated in the general emergence of new fibres.

Breedis[2] found that the prevention of wound contracture was a pre-requisite for the formation of new hair follicles, and it seems reasonable to suppose that in the present experiments this was achieved by the presence of the fœtal homografts. The possibility that an interaction between fœtal and adult tissue was responsible for the phenomenon of neogenesis cannot be dismissed. However, in the absence of distinguishable fœtal skin, our findings show that the skin of adult sheep has not entirely lost the potential for the initiation of new wool follicles.

Penetration of *Fasciola gigantica* Cobbold, 1856 into Snail Hosts

I have recently demonstrated[1] that penetration of *Fasciola hepatica* into *Limnaea truncatula* is a brief but elaborate process which involves the successful attachment of the miracidium to the snail, seemingly by suctorial adhesion, and the production of a secretion which cytolyses the integument of the snail in a circumscribed area underlying the anterior non-ciliated pit of the larva. Not until the snail's

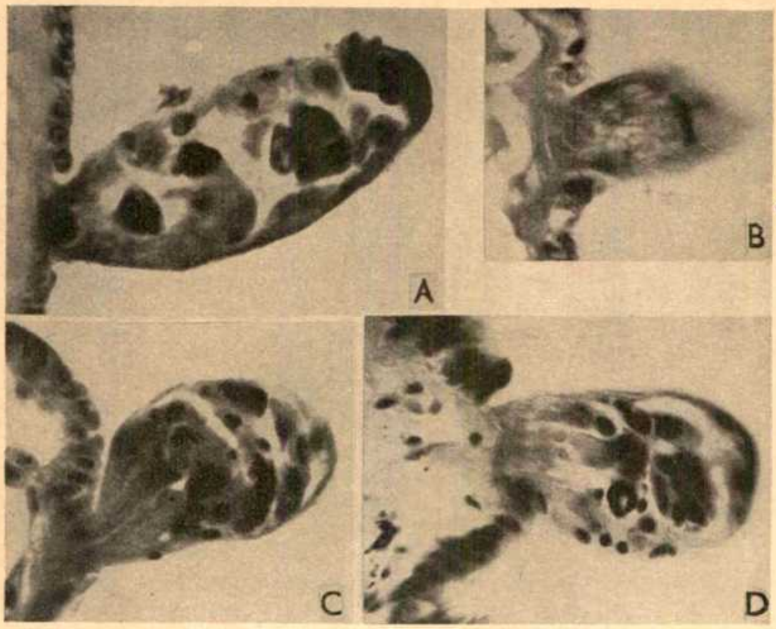

Fig. 1. *Fasciola gigantica* sections (8μ thick) showing early stages of penetration. *A* and *B*, miracidium attached to mantle (anterior end only in *B*). *C* and *D*, miracidium attached to body

epithelium has been perforated by cytolytic action does the larval trematode thrust itself into the snail's body. By the time these preparations for entry have been completed, the miracidium has cast off its ciliated epithelium, so that although it is the miracidium which attacks the snail, it is the young sporocyst which enters the snail's body.

It is now possible to demonstrate that the process is precisely similar during penetration of *Fasciola gigantica* into certain snails, all three species of which became infected, though not with equal facility or intensity. Normal routine procedures were followed in establishing infection, and periods of 30, 60 and 120 min. which were allowed for penetration were adequate. It is necessary to state further that the serial sections and photomicrographs here referred to concern snails which are believed to belong to the species *Limnaea rufescens* Gray, which has been once regarded[2] as merely a race of the well-known snail *Limnaea auricularia*, and was designated "*L. auricularia rufescens*" in a letter published in these columns[3]. What is stated, however, is true also for *Limnaea natalensis*, and probably true for *Limnaea acuminata*, although penetration into this species was seldom seen.

During early preparations for penetration which the miracidium of *Fasciola gigantica* makes when attached to the mantle epithelium, the anterior papilla of the larva is retracted in what must be regarded as suctorial action (Fig. 1*A*). Even when the larva has made contact with the sub-epithelial tissues of the snail, the anterior extremity of the larva is remarkably obtuse and could not look less like a piercing organ (Fig. 1*B*). This is true also for sections which reveal the extent of the damage done to columnar epithelia (Fig. 1*C* and *D*). As is seen during penetration of *Limnaea truncatula* by *Fasciola hepatica*, the damaged epithelial cells of the foot or body which protrude at the rim of the perforation created by cytolysis tend to become heaped externally to form a chimney-like eminence around the anterior region of the larva. At this stage the miracidium likewise casts off the ciliated cells of the most anterior tier (Fig. 2*A*). Soon afterwards, the larva is pushing this denuded anterior region of the body (as well as the anterior papilla) into the opening (Fig. 2*B*). The more posterior ciliated cells of the larva are then becoming loosened from underlying tissue, and ultimately they are cast off as well. When still later the larva squeezes through the opening into the body of the snail (Fig. 2*C*) it is evidently devoid of a ciliated investment, so that without a doubt the entering larva is a globular young sporocyst (Fig. 2*D*).

The cytolytic secretion which is produced by the miracidium of *F. gigantica*, like that produced by the larva of *F. hepatica*, may be termed 'digestive' in the sense that the larval gut is concerned, as are paired gland cells, in its production. In both species of miracidia the gut comprises a syncytium having a typical cluster of four nuclei, and both a mouth and a lumen can be seen in some sections. The secretion is acting on the snail's epithelium at a time when the miracidium is in fact undergoing metamorphosis. In both species therefore it is a young sporocyst which enters the snail, although it is the miracidium which

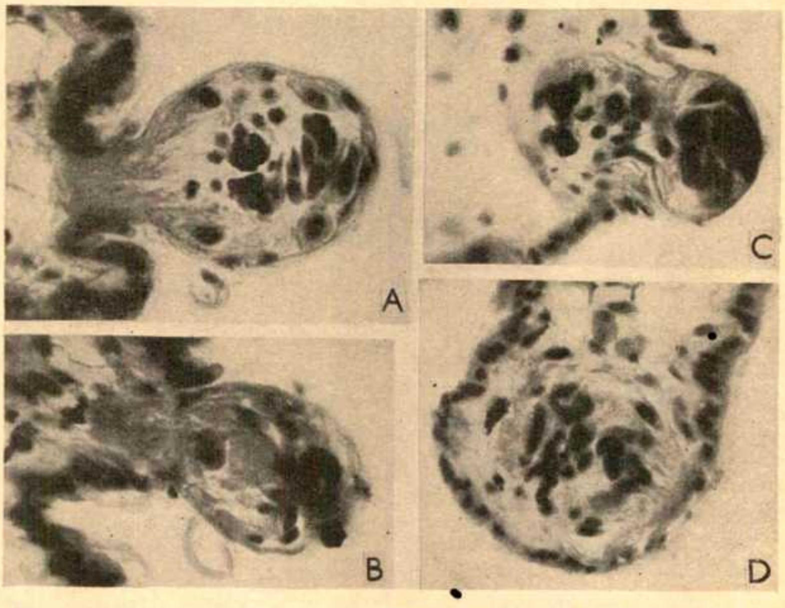

Fig. 2. *Fasciola gigantica* sections (8μ thick) showing later stages of penetration. *A* and *B*, miracidium casting off ciliated cells. Note broken cells heaped at margin of opening. *C*, partial entry of young sporocyst. *D*, complete entry

first adheres to the snail's integument and then cytolyses it to the ultimate perforation. Observations at present being made indicate that penetration of *Schistosoma mansoni* into *Australorbis glabratus* is a closely similar process, giving further reason to believe that entry into the molluscan host is likely to be a unified process of the kind indicated here in all the digenetic trematodes which have a ciliated miracidium.

My thanks are due to Mr A. T. Green for taking the photographs.

Association-Analysis in Plant Communities

THE problem of subdivision of a population characterized by a correlation matrix obtained from a set of 2 × 2 contingency tables has recently been the subject of communications by Williams and his colleagues[1,2]. The basis of Williams's method is to choose that species which, by its presence or absence, subdivides the population of ecological observations in the most efficient manner possible. The purpose of this communication is to question the advisability of placing so much reliance on a single species, no matter how well selected.

Following Goodall's[3] discussion we may define a homogeneous unit of vegetation as one in which all species associations are indeterminate or non-significant. Two such units may then be specified as:

	Unit 1	Unit 2
Species *A*	a_1	a_2
Species *B*, etc.	b_1	b_2

where a_1 is a value of unity or less representing the chances of species *A* being present in a quadrat of specified size within a stand of unit 1, the chances of joint occurrence of species *A* and *B* in quadrats of that unit being given by a_1b_1. With a large population of quadrat samples composed of equal numbers of the two units the only subdivision which will reduce all residual associations to non-significance at the first dichotomy is that which reproduces the two units: and this division will be attained by Williams's method when one species is universally present in one unit and universally absent in the other. If the two units are of very different floristic structure many species may fulfil these requirements, and the division will be obvious without elaborate calculation. Conversely, it is probable that when computational assistance is most needed on account of the resemblance of the two units, and most likely to be employed, no species will be so conveniently distributed. It may then be necessary to rely for division on species *X*, for example, with values of $x_1 = 0{\cdot}9$, $x_2 = 0{\cdot}1$, which would misclassify 10 per cent of the quadrats and produce groups in which association had not been reduced to non-significance. Further subdivision and recombination may yield a very much closer approximation to the two constituent units, but recombination can be a questionable process[2].

In this simple theoretical example the actual species (X) selected for subdivision of the population by Williams's method depends on the values of x_1 and x_2, since (apart from an unlikely circumstance) the species with the greatest $\Sigma|r|$ corresponds to the one with the highest value of:

$$\frac{|x_1 - x_2|}{\sqrt{(x_1 + x_2)(2 - x_1 - x_2)}} \text{ or } f(X)$$

The greatest possible value of this function is 1 when $x_1 = 1$, $x_2 = 0$, so that as has already been suggested a species universally present in one unit and universally absent in the other is automatically selected if such exists. In the absence of any species approaching this ideal, $\Sigma|r|$ might choose species Q having $q_1 = 0{\cdot}4$, $q_2 = 0{\cdot}0$ ($f(Q) = 0{\cdot}5$), which misclassifies 30 per cent of the sites. This species would be chosen in preference to P which, with $p_1 = 0{\cdot}74$, $p_2 = 0{\cdot}26$ ($f(P) = 0{\cdot}48$), only misclassifies 26 per cent of the sites. Whereas one of the groups sorted out by Q has no significant association, the total residual level must in some sense be higher than that left by division on P, so that the species selected by $\Sigma|r|$ (or $\Sigma\chi^2$ since in this case the two give the same answer) will not necessarily be that one which subdivides the population in the most efficient manner possible. "Theoretical considerations, it will be recalled, tell us that it is *likely* to do so, not that it will"[2].

Goodall[4] has also advocated the use of factor analysis methods in ecological work, and it is tempting to apply them to a matrix built up from presence and absence data. But these methods are intended for use with continuous variables and are not necessarily suited to such a matrix: in fact the scatter of the first two factors may be misleadingly distorted (Harberd, D. J., unpublished work). Furthermore, extraction of more than two factors only yields a confusing array of statistics very difficult to visualize and interpret. However, with presence and absence data the distance between two sites in multi-dimensional space (an approximation to Mahalanobis's D^2) can be taken as the number of species found once only in the two species lists. This quantity, hereafter called d^2, is easily determined by inspection of species lists and has several attractive properties. Thus, so long as the relevant part of the species log area curve is linear, its value between stands of the same vegetational unit is independent of the quadrat size used, and characteristic of that unit.

A complete table of d^2 between the sites in a particular study is easily though laboriously constructed. One such table relating to 80 local bent-fescue sites was fairly easily sorted by eye into seven less heterogeneous groups characterized by low mean d^2 within groups relative to that between groups.

Table 1. CHANCES OF FINDING SOME SELECTED SPECIES IN TURVES CUT WITH SAMPLING TOOL IN EACH OF SEVEN SITE GROUPS

Species	Site groups						
	1	2	3	4	5	6	7
Agrostis stolonifera	0·37	0·06	—	—	—	—	—
Sagina procumbens	0·66	0·35	0·14	0·12	—	—	—

Poa trivialis	0·77	0·49	0·22	0·15	0·06	—	0·02
Trifolium repens	0·97	0·91	0·70	0·82	0·74	0·60	0·17
Festuca rubra	1·00	1·00	1·00	0·97	0·94	0·77	0·54
Cerastium vulgatum	0·14	0·58	0·38	0·38	0·31	0·10	0·02
Cynosurus cristatus	0·29	0·29	0·44	0·35	0·19	0·03	—
Galium pumilum	0·03	0·09	0·06	0·20	0·03	—	—
Prunella vulgaris	—	0·24	0·12	0·37	0·31	0·10	—
Carex caryophyllea	—	0·04	0·22	0·53	0·74	0·50	0·12
Viola riviniana	—	0·02	0·02	0·18	0·44	0·17	0·01
Luzula campestris	—	0·06	0·28	0·57	0·51	0·90	0·50
Festuca ovina	—	0·06	0·44	0·57	0·87	0·87	0·95
Galium hercynicum	—	—	—	0·07	0·03	0·30	0·65

(The possibility of using a computer for this process is at present being investigated.) Furthermore, the groups fell into a series (numbered 1–7 from flushed to leached), the mean between group d^2 being lower for neighbouring groups than for more distant groups. Reconstructing the floristic composition of the groups from the species lists, it can be seen that each species tends to attain its greatest frequency in one of the groups, tailing away on either side (Table 1). In no case in the whole table is a species universally present in one site group and universally absent in the next: we are, in fact, considering the case postulated of closely related vegetational units where differences are in relative frequency rather than in presence and absence. The species with the highest $\Sigma\chi^2$ is *Festuca ovina*, which increases gradually in frequency across the whole breadth of the table.

PATHOLOGY

Histotrophic (Parasitic) Stages of *Hæmonchus contortus*

Work on resistance and immunity to parasitic infections over the past thirty years has tended to support the view that the immune response, which has been shown to be humoral in nature, is stimulated by the excretions and secretions of the invading parasite[1,2].

It was first reported by Stoll[3] that sheep, after undergoing an initial infection, develop a resistance to reinfection with *Hæmonchus contortus*. Later, Stoll[4] reported that he was able to induce resistance by injecting, intraperitoneally or subcutaneously, sterilized exsheathed infective *H. contortus* larvæ.

At this Institute attempts to repeat this work met with failure; however, it was later learned[5] that the immunizing doses used by Stoll (4,000–22,000 larvæ per kgm. body-weight) were far greater than the numbers of larvæ used for inoculations in our unsuccessful experiments[5].

Following the unsuccessful vaccine trials a series of experiments were designed to elucidate further the mechanism of resistance to *H. contortus* and if possible to determine the source of antigen and site of the antibody response.

Three groups of sheep were used: (1) worm-free lambs; (2) worm-free sheep (one year old); (3) resistant sheep (one year old). Animals from each group were challenged with oral doses of 5,000–100,000 *H. contortus* larvæ and killed at regular intervals during the second to fifteenth day after infection. After slaughter, the abomasum was quickly opened and treated in the following manner: (*a*) Pieces of the pyloric and cardiac portions were cut out and fixed for histological examination. (*b*) The mucosa was then scraped off into warm saline. Some of the histotrophic stages were quickly collected, rewashed in warm sterile Tyrode and transferred into previously prepared sera from susceptible and resistant sheep. (*c*) Another sample of histotrophic larvæ was collected and pooled with similar stages from other sheep for use in protection tests. Such larvæ were either directly injected into susceptible sheep or deep-frozen for later use. (*d*) The remaining mucosal scrapings were fixed in formalin for detailed morphological studies of the parasitic stages.

The results of these studies may be briefly summarized as follows:

Morphology. Morphological studies of the histotrophic stages revealed that the rate of development of the parasitic phase is dependent upon the age and immunological state of the host. In susceptible lambs most infective (that is, L_3 stage) larvæ have undergone differentiation and completion of the first parasitic ecdysis by the third day after infection (that is, to the L_4 stage) but no marked growth has occurred. The larva begins to increase in size, reaching 1–1·5 mm. about the fifth day, when a second ecdysis takes place. Sexual differentiation is apparent in the L_5 stage and the young adult reached 2–5 mm. in length by the seventh to ninth day. Eggs are first produced between the twelfth to fifteenth day. In older susceptible sheep the first parasitic ecdysis is not generally completed until the fifth day and the entire cycle is delayed, with eggs first being produced on the sixteenth to twenty-fourth day. In resistant sheep the life-cycle of the parasite proceeds to the L_4 and L_5 stages by the fifth to seventh day, but the majority of worms become inhibited at these stages until they are thrown off, usually by the tenth to fifteenth day.

Histology. Histological examination of the mucosa and the L_3, L_4 and L_5 histotrophic larvæ *in situ* has so far revealed no evidence of host tissue responses to these stages in either susceptible or resistant animals up to the ninth day. Damage to host tissue first occurs after the tenth day, when young adults begin to burrow into the mucosa to suck blood.

The histotrophic larvæ appear to pass their existence within the paramucosal lumen, that is, below the mucous layer on the surface and in the crypts of the villi. In resistant animals where there is evidence of inhibited development of the histotrophic stages, the effect is apparently produced entirely through humoral agencies.

Serology. Studies on the *in vitro* reaction of serum to exsheathed L_3, L_4 and L_5 larvæ and adult worms were carried out using sheep sera which had been serially diluted with phosphate buffer, some with and some without complement. It was found that complement was not required and that precipitations occurred at dilutions up to 1 : 40. A minimum time of 10–12 hr. appeared to be required and precautions had to be taken to produce bacteria-free preparations. Most larvæ remained active for up to 36 hr. of immersion.

The L_4 and L_5 stages showed the greatest antigenic activity, overnight preparations revealed precipitates along the inside of the intestine, a plug formation at the rectal sphincter and precipitated globules at the excretory pore. Neither L_3 larvæ nor adult worms showed any apparent reaction to immune serum although the exsheathed L_3 began to show a form of streaming oral precipitate after about 36 hr. Adult worms remained active for up to 72 hr. and continued to produce eggs for most of this time.

Protectivity. The protection experiments showed that the L_4 and L_5 stages were significantly more antigenic than the L_3 stages. A protection of about 70 per cent (based on abomasal worm counts) was achieved in two groups of sheep, one group of which received injections of several thousand fresh L_4 and L_5 stages and the other group similar quantities of 0·5 per cent formalin-treated L_4 and L_5 larvæ. No protection could be induced below 100,000 with L_3 larvæ and the best that was achieved with larger amounts was a 50 per cent advantage over controls.

The evidence from these studies indicates that the histotrophic stages of *H. contortus* are important sources of antigen and appear to be the antibody-susceptible stages.

'Carcinolipin': an Endogenous Carcinogenic Substance

A FACTOR affecting protein synthesis has been recently detected in egg-yolks[1]. This substance has since been isolated in crystalline form and it is possible to obtain the same crystalline material from animal tissues also[2]. Liver and other tissues from tumour-bearing rats contained a higher amount of this compound when compared with the same tissues from normal animals[3].

This material enhances the incorporation of labelled amino-acids into proteins of Ehrlich ascites cells and tissue-homogenates *in vitro*[2]. Also the incorporation of labelled amino-acids into proteins of rat liver microsomes is stimulated in the presence of this substance[4], and it seems that it is capable of influencing protein biosynthesis in its every stage[5]. The net-synthesis of serum albumin in rat liver slices *in vitro* is greatly enhanced by the addition of this compound into the incubation mixture[6].

The effect on the incorporation of labelled amino-acids into ascites cells protein appears to be strikingly dependent on dose Some doses have stimulatory activity while others cause an inhibition of this process[2]. The same general pattern was also found when the effect of carcinogenic hydrocarbons was tested in the same system. Related non-carcinogenic hydrocarbons are free of this activity, which seems to be rather specific for carcinogenic substances[7]. For this reason carcinogenic activity was presumed for our substance mentioned above.

To investigate this possibility further, 50 Wistar rats of both sexes, 8 months old, were injected subcutaneously with this compound (3 mgm. each) in olive oil. Control group of 50 animals received the same amount of pure olive oil.

The incidence of tumours in the experimental group is given in Table 1. After fourteen months no tumours have been found in the control group. An unusually high incidence of chronic pneumonia with frequent bronchiectasias (10 cases) appeared in the experimental group (no case in the controls as yet). This disease is known to occur fairly often in old rats[8] but not in younger ones.

This experiment is of course not yet completed, and there are further tumours appearing in the experimental group. However, it is clear already from these preliminary results that our compound has definite carcinogenic activity.

Table 1. TUMOUR INCIDENCE IN RATS TREATED WITH 'CARCINOLIPIN' (Latent period is given in months after single subcutaneous administration of 3 mgm. 'carcinolipin')

Latent period	Site	Histological appearance
5	Subcutaneous (site of injection)	Sarcoma
9*	Abdominal cavity	Carcinoma
9†	Lungs and abdominal cavity	Carcinoma
9	Subcutaneous (site of injection)	Sarcoma
11	Subcutaneous (site of injection)	Sarcoma
12	Mammary gland	Fibroadenoma
13	Mammary gland	Fibroadenoma

* In this case a very large tumour was found originating perhaps in the liver tissue.

† Very large tumours were found in this case, one originating from the lungs, the other being localized in abdominal cavity. Because of the magnitude of these tumours as well as their highly polymorphous appearance, the same in both cases, it was not possible to ascertain the site of the primary tumour.

The chemical nature of this substance is not quite clear. It is of lipid nature and seems to contain a bound phosphorylated pentose, also. Because of the predominantly lipid character of the active substance as well as its carcinogenic properties, the name 'carcinolipin' is proposed for it until its exact chemical structure is made clear.

It is very probable that 'carcinolipin' is responsible for the higher incidence of tumours found in mice fed egg-yolks[9]. It seems quite probable, too, that 'carcinolipin' might be identical with the endogenous carcinogenic substance[10]. A closely similar isolation method followed in our experiments strongly supports this view. Moreover, tumours of various types were found. The ability to produce tumours not only on the site of subcutaneous injection seems to be characteristic of the endogenous carcinogenic substance[11], carcinogenic hydrocarbons, on the other hand, producing almost exclusively subcutaneous sarcomas after this mode of administration.

'Carcinolipin' seems to possess a general role of a growth-promoting factor in tissues and other biological materials, since it stimulates the growth of young rats and chickens when added to their diet (Hradec, J., and Trojan, K., unpublished work). Probably it is capable of inducing malignant growth only in certain circumstances, which are being investigated further in our laboratory.

ENTOMOLOGY

Male Genitalia of *Apis* Species

The external parts of the male genitalia of *Apis* species are poorly developed, and an elaborate structural modification of the internal walls of the ædeagus is everted during copulation. Hitherto undescribed except for *A. mellifera*, this apparatus has now been examined in specimens of the other three species from Ceylon kindly obtained by Dr. B. A. Baptist and Mr. L. A. S. Perera.

Fig. 1 shows the organs of *A. indica* and *A. mellifera* (in an over-everted condition which is not reached in natural mating[1]). *A. indica* lacks the hard plates of *A. mellifera* and has the small projections at the bases of the sticky horns enlarged to trilobed structures. The shapes and proportions of the various parts also differ. In the other two species only unverted organs of preserved specimens were examined. Neither has hard plates. *A. dorsata* has three additional pairs of sticky horns, which correspond to the trilobed structures of *A. indica*, and five additional bristly projections. *A. florea* has trilobed structures somewhat like those of *A. indica*, a single pair of sticky horns which are relatively much longer than in the other species, and no bristly projections. The endophallus differs markedly in shape from that of the other species and has fleshy areas (presumably glandular) in its walls.

Endophallic plates, apparently identical with those of European bees, were found in bees from Palestine, Uganda, Tanganyika (received from Dr. F. G. Smith) and South Africa (all of which are considered to belong to sub-species of *A. mellifera*). It would be interesting to know whether they ever occur in the apparently closely allied *A. indica*. Male specimens of both species would be welcomed from regions of possible overlap between them, such as Persia, Afghanistan, Pakistan or northern China. They should preferably be preserved in glycerine.

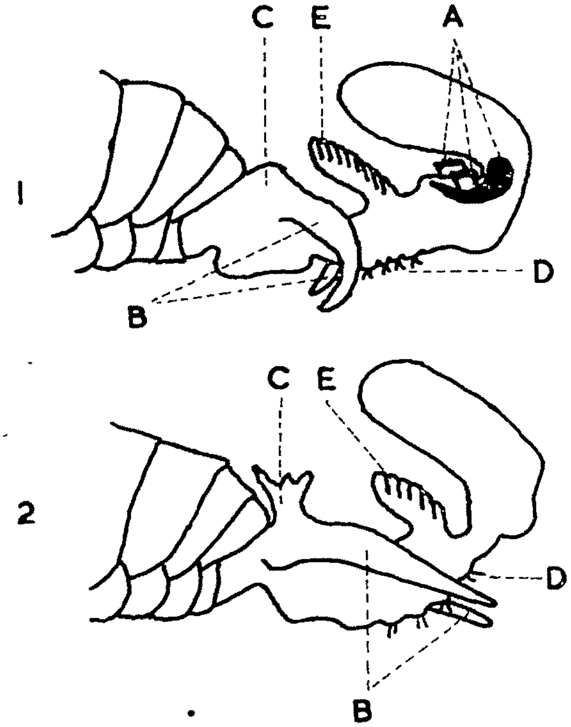

Fig. 1. Male genitalia. 1, *A. mellifera*; 2, *A. indica*. *A*, Hard plates; *B*, sticky horns; *C*, basal projection and homologous trilobed structure; *D*, four hairy projections; *E*, fimbriate lobe

Homocatechol in an Insect Cuticle

During the course of an investigation into the hardening of the cuticle of the desert locust *Schistocerca gregaria*, 4-methyl-catechol, a substance not previously recorded from insect cuticles, was identified chromatographically in abundant amounts from fully hardened cuticles after acid hydrolysis as well as after alkaline hydrolysis under reducing conditions. This substance, although absent from the soft cuticles newly exposed on moulting, is readily detected after they have been artificially tanned with *B*-(3 : 4-dihydroxyphenyl)acetic acid, indicating decarboxylation of the tanning agent. If *B*-(3 : 4-dihydroxyphenyl)propionic acid is used in place of the acetic derivative to tan the cuticles a compound with similar properties is recovered from the cuticles. This latter compound, which is also present in aqueous extracts of naturally tanned cuticles, has an R_F value, in benzene/acetic acid/water, slightly higher than that of 4-methyl-catechol. It can only be presumed to be 4-ethyl-catechol similarly formed by decarboxylation. *B*-(3 : 4-dihydroxyphenyl)acetic acid and 4-methyl-catechol have also been detected after tanning cuticles with *B*-(3 : 4-dihydroxyphenyl)-propionic acid, and the formation of these compounds seems a clear indication that degradation of *ortho*-diphenolic compounds in an insect cuticle[1] to compounds having shorter side-chains may be accompanied by decarboxylation. Hackman and Todd[2] have already demonstrated the decarboxylation *in vitro* of 3 : 4-dihydroxybenzoic acid in the presence of a plant phenolase.

In the course of this work, it was found that *B*-(3 : 4-dihydroxyphenyl)propionic acid is present in the soft cuticle of *Schistocerca*. This is important, for Hackman[3] has suggested that the degradation of *B*-(3 : 4-dihydroxyphenyl)alanine may not proceed through the propionic derivative.

In the full account of this work, to be published elsewhere, it will be shown that the exocuticle of *Schistocerca*, which differs markedly from the amber exocuticle of other insects[4], is not tanned by *para*-quinones[5,6] but by *ortho*-benzoquinone derived from catechol.

This work was made possible by a grant from Unesco and carried out in the Zoology Department of the University of Manchester. I wish to thank Prof. R. Dennell for the hospitality of his laboratory.

BACTERIOLOGY

Influence of Cobalt and Zinc Ions on the Growth and Porphyrin Production of *Mycobacterium tuberculosis avium*

It was shown by Baisden[1] that the addition of traces of bacillary ash to a synthetic medium prepared from chemically pure constituents was a very effective stimulant for the growth of *Mycobacteria*, and similar results could be obtained with a mixture of fourteen pure inorganic salts. Various other workers have demonstrated the growth-promoting effect of metal ions, especially zinc[2-4] and manganese[5]. A simpler mixture of pure inorganic salts than that used by Baisden has been described recently by Paterson *et al.*[6]. This is as effective an addition to Dorset's[7] medium for growing large quantities of human type bacilli for the production of tuberculin as is Baisden's.

A substantial stimulation of the growth of *Myco. tuberculosis avium* (strain D_4R) has now been observed, using this trace-element supplement of calcium, cobalt, copper and zinc ions. At the same time, organisms grown on the supplemented medium were usually found to be reddish-brown in colour, and a red pigment which fluoresced strongly in ultra-violet light was readily extracted into cold acetone. Following the procedure used by Todd[8] for the extraction of coproporphyrin III from *Myco. karlinski*, hydrochloric acid solutions of the pigment were obtained having very similar light-absorption characteristics in the range 380–630 mμ to those of coproporphyrin. The porphyrin content of a given mass of organisms was assessed by measuring the optical density at 402·5 mμ of the pigment extracted finally into 10 ml. of 20 per cent hydrochloric acid (v/v concentrated acid). The absorption maximum of the Soret band shifted from 402·5 mμ to 401 mμ on dilution of the extract to 0·15 *N* in hydrochloric acid. This is in agreement with the absorption data of Todd[8] and Jope and O'Brien[9].

In these experiments the organisms were grown on the basic Dorset's medium and on the same medium containing the complete trace element supplement of Paterson *et al.*[6]. Three additional groups of flasks were also prepared in which the supplements simply consisted of either 0·27 p.p.m. cobalt or 1·07 p.p.m. copper or 6·04 p.p.m. zinc. After periods of 33–53 days after inoculation, the organisms were harvested, the yields were determined (expressed as bacillary dry weight) and the porphyrin contents of the bacilli estimated (Table 1).

The results of the experiments show that after 45 days incubation a supplement of calcium, copper, cobalt and zinc stimulated the growth of *Myco. tuberculosis avium* three-fold and at the same time the production of porphyrin (which was maximal after 45 days) was increased about 62 times. The effect of adding the same amount of zinc or cobalt to the medium separately was also to stimulate growth and porphyrin production, but in either case the effect was only about half as great as that induced by the full supplement. Copper alone had no effect either on the yield of organisms obtained or on the amount of porphyrin produced. Thus, the stimulating effect of the trace element supplement of Paterson *et al.*[6] on the growth and free porphyrin production of *Mycobacteria* is largely if not solely due to zinc and cobalt.

Table 1. EFFECT OF COBALT, COPPER AND ZINC IONS ON GROWTH AND PORPHYRIN PRODUCTION OF *Myco. tuberculosis avium* (STRAIN D_4R)

Incubation period. (Days at 37° C.)	Additions* to medium	Yield of organisms (gm.)	Amount of porphyrin extracted. Optical density of 10 ml. hydrogen chloride solution at 402·5 mμ
33	Basic medium	10·0	1·100
38		9·3†	0·915
45		7·9†	0·609
48		8·2†	0·273
33	Full supplement of calcium, cobalt, copper and zinc (ref. 6)	16·0	8·70

Antigens of Spheroplast Membrane Preparations from *Escherichia coli* B

Vennes and Gerhardt[1] demonstrated quite conclusively by serological means that no trace of cell-wall antigens remained attached to the protoplast membranes prepared by lysozyme treatment of *Bacillus megaterium*. Because of the differences in the chemical composition of walls of Gram-positive and Gram-negative bacteria it has been suggested that the osmotically fragile, spherical bodies produced from Gram-negative bacteria by lysozyme treatment or induced by penicillin action have only partially lost their cell-wall material[2]. Salton and Shafa[3] have shown that some cell-wall components remain in spheroplasts prepared by the penicillin method from two Gram-negative species. Their results indicated that the lipo-protein components remained attached to the spheroplasts. The wall preparations from the spheroplasts were also agglutinated by a cell-wall antiserum.

In the present investigation spheroplasts of *Escherichia coli* B were produced by the lysozyme–

versene treatment of Repaske[4]. With the aid of serological techniques it has been shown that (*a*) cell-wall antigens remain in carefully washed membrane preparations from the spheroplasts and (*b*) there are specific antigens of the spheroplast membrane which are not present in detectable amounts in cell-wall preparations.

The bacteria were grown in a glucose-salts medium[5] and harvested by centrifugation in the cold at the end of the logarithmic phase of growth. Cell walls were obtained by differential centrifugation following disintegration of the cells in a Hughes's press[6] at −20° C. The disintegrate was centrifuged for 15 min. at 25,000*g*. Gentle removal of the surface layer yielded wall preparations that could be purified with ease.

Spheroplasts were prepared by lysozyme–versene treatment according to Repaske[4]. The spheroplasts were centrifuged in the cold and the pellet suspended in 0·01 *M* phosphate buffer at *p*H 7 to lyse the spheroplasts. Deoxyribonuclease (0 05 mgm./ml.) was added to facilitate homogenization.

The resulting preparations of walls and spheroplast ghosts were washed twice in *M* sodium chloride and twice in 0·1 *M* phosphate buffer at *p*H 7, with intervening centrifugations at 25,000*g* for 15 min. The homogeneity of the preparations was controlled by phase contrast microscopic examination.

Immune sera against the cell wall and spheroplast membrane preparations were obtained by immunizing two white rabbits for each of the antigen preparations. The animals were inoculated intravenously twice a week over a period of nine weeks. The initial dosage of 2 mgm. was increased threefold during this nine-week period. Following one week of rest from antigen inoculations the animals were killed by bleeding. The 50 per cent end-point method of complement fixation[7] was used in assaying the immunological reactions. The readings were made visually to 10 per cent accuracy.

Cell walls, spheroplast membranes and whole cells were used as antigens in the reactions and each immune serum was tested against all three in the complement fixation test. The two antisera had the same titre against the spheroplast membrane antigen, and the same titre was obtained when antiserum to spheroplast membranes was tested against cell-wall antigen. The reaction between cell walls and homologous antiserum was slightly weaker. The results are indicated in Table 1.

Table 1. TITRES IN THE COMPLEMENT FIXATION TEST OF WHOLE CELLS AND ISOLATED STRUCTURES OF *Escherichia coli* B

Antigen	Antiserum to	
	Spheroplast membranes	Cell walls
Spheroplast membranes	3,840	3,840
Cell walls	3,840	1,920
Whole cells	1,920	1,920

The antiserum to the spheroplast membrane preparation was absorbed with an excess of whole-cell antigen, prepared by heating a cell suspension to 100° C. for 2 hr. The method of absorption followed the conventional procedure. After each absorption the serum was tested against cell wall and spheroplast membrane preparations. The process was repeated until one of the antigens failed to give an inhibition of the hæmolysis.

As can be seen in Table 2, it was possible to remove the antibodies against cell-wall antigens by absorption with whole cells, as indicated by the complement fixation test. However, the antiserum still showed a positive reaction after nine absorptions, when tested against the spheroplast membrane preparation. This means that there are antigenic materials, specific for the spheroplast membranes, which are not present in cell-wall preparations.

Table 2. REACTIONS OF AN ANTISERUM AGAINST A SPHEROPLAST MEMBRANE PREPARATION ABSORBED WITH HEAT-TREATED WHOLE CELLS

The figures in the left-hand column indicate the number of absorptions

Absorption number	Absorbed antiserum tested against	
	Spheroplast membranes	Cell walls
0	3,840	3,840
1	1,920	1,920
2	960	480
4	240	60
6	120	15
8	120	0
9	120	0

Elongation of a Leprosy Bacillus (*Mycobacterium lepraemurium*) in a Cell-free Medium

THE bacillus of human leprosy (*Mycobacterium leprae*) was one of the first bacteria to be identified as the causative organism of a disease; but it remains to this day among the very few that have failed to grow in any type of culture medium. There is indeed doubt as to whether it has ever even been transmitted to an experimental animal. Much of the laboratory work on leprosy has therefore been concerned with the only other closely related organism, the rat leprosy bacillus (*Mycobacterium lepraemurium*), which infects rats and mice, causing disease having many of the characteristics of human leprosy; in common with *M. leprae* it is unusually slow-growing in the body, with at least 10 days elapsing between each generation.

An important advance is the recent observation of limited multiplication of *M. lepraemurium* in tissue culture[1–3], but the organism, like *M. leprae*, has remained uncultivated so far in any cell-free medium, despite a vast, painstaking effort by many workers, using the most varied media[4,5]. Moreover, studies on the respiratory metabolism of *M. lepraemurium* have shown an almost complete lack of response to the many substances tested; even albumin and yeast and liver extracts, which do stimulate respiration, are apparently not themselves oxidized, nor do they promote utilization of other substrates[5].

For some time, workers in these laboratories have found it possible with the electron microscope to distinguish, under certain conditions, a completely

Table 1. MEAN LENGTHS AND PERCENTAGE DEGENERATION OF *Mycobacterium lepraemurium* AFTER INCUBATION AT 37° C. IN VARIOUS MEDIA
Mean length of bacilli after up to 24 hr. incubation (base line) = 1·64 ± 0·01μ, with 5 per cent degenerate

	Medium	Days incubated							
		7		14		28		63	
		Mean length (μ)	Degenerate (per cent)	Mean length (μ)	Degenerate (per cent)	Mean length (μ)	Degenerate (per cent)	Mean length (μ)	Degenerate (per cent)
A	Water	—	—	1·58	(*50*)	1·57	(*50*)	—	—
B	Phosphate buffer	—	—	1·55	(*50*)	1·59	(*80*)	—	—
C	As *B* + 20 per cent sucrose	—	—	—	—	1·64	(*90*)	—	—
D	Nutrient	1·75	(*10*)	1·91*	(*10*)	2·14*	(*80*)	2·24*	(*80*)
E	As *D* + sugar:								
*E*1	+ 10 per cent sucrose	—	—	2·85*	(*10*)	3·12*	(*20*)	3·44*	(*95*)
*E*2	+ 20 per cent sucrose	1·79	(*10*)	2·21*	(*10*)	2·42*	(*30*)	3·12*	(*95*)
*E*3	+ 8 per cent glucose	—	—	2·44*	(*5*)	2·70*	(*10*)	2·88*	(*80*)
F	As *E*1 + isoniazid	—	—	1·70†	(*20*)	1·64†	(*40*)	—	—

The table gives the summated results derived from all experiments performed.

* The difference between these figures and the base line length (1·64μ), as well as between the figures for *D* and all *E*, far exceed any possible chance fluctuation ($P \ll 0·0001$).

† These figures are not significantly above the base line length of 1·64μ ($P > 0·3$); they are lower than the lengths of *E*1 by an amount far exceeding any possible chance fluctuation ($P \ll 0·0001$).

degenerate form of *M. lepraemurium* that is no longer able to produce disease[6]. In this way we have found that in the conventional culture media the bacilli not only fail to multiply but also are degenerate after a few weeks of incubation at 37° C. In one of our experiments, however, involving a liquid nutrient medium of the type used for culturing tubercle bacilli, with 20 per cent sucrose added in the hope of achieving a beneficial stabilizing effect, electron microscopy at 2 months revealed that, although the bacilli had degenerated, a number looked unusually long. It seemed possible that before death some actual, if limited, growth might have occurred in this medium. We therefore followed up this observation by investigating the frequency distributions of the lengths of rat leprosy bacilli after varying times of incubation in different media.

Bacilli of *M. lepraemurium*, partly freed from tissue components, were provided by our colleague Dr. R. J. W. Rees from the homogenized livers of intravenously infected mice. The bacilli were added to the following liquid media, contained in 5-ml. amounts in 25-mm. diameter test-tubes, to make final concentrations of about 5×10^7 bacilli/ml.: (*A*) distilled water; (*B*) phosphate buffer 0·01 *M*, *p*H 7·0; (*C*) phosphate buffer plus sucrose 20 per cent (w/v); (*D*) a basal nutrient medium composed of Difco 'Casamino' acids, 2·5 gm.; asparagine, 0·3 gm.; anhydrous disodium hydrogen phosphate, 2·5 gm.; potassium dihydrogen phosphate, 1·0 gm.; sodium citrate, 1·5 gm.; crystalline magnesium sulphate, 0·6 gm.; glycerol, 25 ml.; distilled water to 1,000 ml. To this basal medium, sterilized by autoclaving, bovine plasma albumin (fraction V), sterilized by filtration, was added to make 0·25 per cent; (*E*) as (*D*), plus sucrose or glucose (sterilized by autoclaving in high concentrations) to give a range from 1 to 20 per cent (w/v), or 0·5–8 per cent (w/v), respectively; (*F*) as (*E*) (with 10 per cent sucrose), plus isoniazid 5 μgm./ml.

The bacillary suspensions in these media were incubated at 37° C. Some were fixed within 24 hr. (base line) by adding formaldehyde to make 2 per cent, while others were incubated for various periods and then similarly fixed. Samples were examined in the electron microscope, set at a magnification of 10,000 by means of standard 0·26-μ diameter spheres of polystyrene latex. A series of concentric circles, the circumferences of which were spaced by 0·5 cm., drawn on the fluorescent screen on which the final image was seen, allowed the lengths of the bacilli to be grouped in intervals of 0·5μ. The lengths of 100 or more bacilli from each sample were measured in this way, and the frequency distributions of lengths and their means were calculated. At the same time the proportion of these bacilli appearing completely degenerate was estimated, giving a rough minimum value for a non-viable count. Of 1,700 bacilli from six samples fixed within 24 hr., the lengths of 74 per cent lay between 1·0 and 2·0μ, and 92 per cent between 1·0 and 2·5μ; the mean was 1·64 ± 0·01μ—a figure very similar to that already reported from the more difficult measurements made with the light microscope[7]. The average proportion degenerate in these base-line samples was 5 per cent.

The mean lengths after incubation (Table 1) indicate no elongation in the three non-nutrient media (*A*, *B* and *C*), compared with the base line at 24 hr.; and degeneration was rapid. On the other hand, a small amount of lengthening could occur even in the ordinary nutrient culture medium (*D*), though again degeneration was fairly rapid. However, in the same medium with 10 per cent sucrose or 8 per cent glucose (*E*), the mean length nearly doubled, and the proportion of bacilli longer than 2·5μ rose from 6 to 67 per cent (sucrose) and to 51 per cent (glucose) in a month (the greater part of the increase being in the first 2 weeks). Moreover, the appearances of degeneration were distinctly delayed, though occurring ultimately and presumably terminating the lengthening process. The contrast in increased length and slowed degeneration between the sugar-containing medium and the same medium alone was evident through the whole range of concentrations of sucrose from 1 to 20 per cent (optimal at 10 per cent), and with 4 and 8 per cent glucose.

The effect of the anti-leprosy drug isoniazid (medium *F*) in preventing the lengthening excludes the possibility that we are witnessing only a passive stretching. Moreover, the electron density (and therefore the weight density) of the bacilli was unchanged in the long bacilli with, if anything, a slight increase in width. This again points to a real increase in bacterial protoplasm in the cultures. We now, therefore, regard the failure to obtain multiplication of the rat leprosy bacillus in culture medium as being due to a failure of the bacilli to divide, and not to their complete inability to metabolize and grow. If means could be found to encourage division, the culture of leprosy bacilli in cell-free media might at last become possible.

We are indebted to Dr. R. J. W. Rees for providing the *M. lepraemurium* and for his interest and advice; and to Miss B. Cooling for undertaking many of the length determinations.

GENETICS

Conditioned Lines of Flax

IT was reported[1] that when different combinations of nitrogen, phosphorus and potassium fertilizer treatments were applied to plants of a single inbred variety of flax the large differences in plant size produced by the treatments were transmitted unchanged to their offspring and to the second and third generations. When a small type so obtained was crossed reciprocally with a large type the effect was transmitted through the male parent almost to the same extent as through the female. When the two types were reciprocally grafted, both types were identifiable in the stock and scion. It was concluded from this that the environment had induced at least semi-permanent changes in the nucleus or cytoplasm or in both. The following summarizes some of the results from further experiments, carried out in 1958, on the second, third and fourth generations of two extreme types, *NK* and *NPK*. *NK* refers to the descendants of plants treated in 1954 with nitrogen and potassium, and *NPK* to the descendants of plants treated in 1954 with nitrogen, phosphorus and potassium.

In the fourth generation the *NPK* plants were still several times the size of the *NK* plants and there was no evidence over all four generations that the difference between them was diminishing. Seed taken from the stock and scion of the reciprocal grafts of *NPK* and *NK* made in the previous year again produced plants of these two distinct types, and they were identical with plants grown from seed from ungrafted plants, or from plants with scions grafted on to like stocks. In all cases the plants were highly uniform, and the two types would appear therefore to be very stable.

Further reciprocal crossings of the two types show the transmission to be equilinear. It seems that the small deviation towards the female parent previously reported was a maternal effect due to those crosses being made between types growing in their respective environments in which they were conditioned. The F_2 showed more variability than the F_1 though no significant increase was obtained with the somewhat limited number of plants grown. A more extensive study is proceeding.

The F_1's may show dominance depending on the environment in which they are grown, but heterosis occurred only in the F_1 seed weight. These departures from the mid-parent value do not necessarily mean that the primary effect of the environmental conditioning has been the induction of chemical changes on the chromosomes giving rise to genes with dominance relations. Purely quantitative cytoplasmic differences, for example, if transmitted equally through the male and female gametes, could produce an F_1 which differed from the mean of the parents in certain environments, and this may be more marked in some characters due to the interplay of physiological processes. Even so, whether the primary differences have arisen in the cytoplasm or in the nucleus they, together with the external factors, form the genic environment and it is the interaction between them all that must be resolved in a final analysis.

There was a significant difference between the log growth-rates of the two types but not between the log growth-rates of plants having the different fertilizers applied directly to them, although the final weight difference was of the same order in both sets. There are, therefore, fundamental metabolic differences between the two conditioned types, such as might be found between two different genotypes.

The first generation of a diallel cross between *NK* and *NPK* conditioned types and four other varieties, two of which were flax and two linseed, was analysed for a number of characters. They included plant weight, side-shoot weight, centre-shoot weight, height and length of side shoots. The most revealing picture was given by the array covariance/variance graphs using the method of genetic analysis of diallel tables of Jinks[2] and Hayman[3]. With each character, the points for the *NK* and *NPK* types on the graph were close together, although the points representing the other varieties changed their positions with the different characters analysed. It would appear from this that the *NK* and *NPK* types are identical in having similar dominant genes. They were also found to be identical in showing the same non-allelic interaction with one of the linseed varieties in side-shoot weight. Interpreted in another way, suppose the variety which was conditioned were entered twice in the diallel table, then a constant amount added to all the cells of the male and female arrays of one of the entries, to represent the larger (*NPK*) type, would give just such a result, for the addition of a constant amount would make no difference to the array variance or covariance. The similarity between the two types in showing no dominance or interaction differences might be taken as further evidence for the absence of residual genetic variability in the conditioned variety, but complete additiveness in effect of the factors responsible for the difference need not necessarily be expected in all environments for the reasons given above.

Finally, the range of types produced by the different combinations of fertilizer treatments of which the *NK* and *NPK* types are the extremes, resembles the continuous range of variation that might be expected from a genetically determined quantitative character, but the relationship between the two systems involved is as yet unknown.

Antiquarian Horological Society (at the Science Museum, South Kensington, London, S.W.7), at 7 p.m.—Mr. Douglas Hughes "Bells and Bellfounding".

Friday, January 8—Saturday, January 9

Association of Applied Biologists (joint meeting with the British Mycological Society, at the London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, London, W.C.1), at 10.15 a.m. daily—Meeting on "The Nature and Exploitation of Crop Plant Resistance to Disease".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Lecturers/Senior Lecturers (with a first- or second-class honours degree in mathematics or engineering, or at least a second-class general honours degree including mathematics) in Mathematics at the Royal Military Academy, Sandhurst—The Ministry of Labour, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting Ref. A.568/9A (January 10).

Senior Lecturers or Lecturers (with a good honours degree and relevant teaching experience) in Mathematics and Physics at the Nigerian College of Arts, Science and Technology—The Council for Overseas Colleges, 12 Lincoln's Inn Fields, London, W.C.2 (January 11).

Lecturer/Senior Lecturer in Nutrition, to undertake teaching and research in livestock nutrition in the Department of Nutrition and Chemical Pathology, Faculty of Rural Science, University of New England, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, January 20).

Babcock and Wilcox Fellow in Nuclear Engineering—The Registrar, Queen Mary College (University of London), Mile End Road, London, E.1 (January 30).

Plant Breeder and Geneticist (honours graduate in science or agricultural science (or with equivalent qualifications) with two or more years of postgraduate research experience) at the Tobacco Research Institute, Commonwealth Scientific and Industrial Organization, Mareeba, North Queensland, to take charge of a programme of plant breeding and genetical investigations which has been in progress at Mareeba for three seasons—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W.C.2, quoting Appointment No. 815/21 (January 30).

Senior Tutor-Demonstrator in Physics at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, January 30).

Chair of Physiology in the London Hospital Medical College—The Academic Registrar, University of London, Senate House, London, W.C.1 (February 1).

Director (experienced administrator with good scientific attainments, a sound knowledge of arable farming and previous experience in agricultural experimental work)—The Secretary, Norfolk Agricultural Station, Sprowston, Norwich, Norfolk (February 1).

Lecturer (with a good university degree and experienced in the teaching of physics and/or mathematics in schools) in Education—The Secretary and Registrar, The University, Southampton (February 1).

Assistant Trials Officer (preferably with practical experience in crop production), to work at Leeds University Farm, Headley Hall, Yorks—The Secretary, National Institute of Agricultural Botany, Huntingdon Road, Cambridge.

Cell Biologist (with a degree and research experience (preferably a Ph D.) in biology, microbiology or biochemistry), to take part in a research project on the fundamental biology of fibroblasts—Dr J. M Mitchison, Department of Zoology, West Mains Road, Edinburgh 9.

Reader or Consultant in Nuclear Physics—The Principal, Bradford Institute of Technology, Bradford.

Research Assistant (preferably with biochemical, biophysical or physiology training), to join a team engaged in research on the problem of intervertebral disk, herniation and degeneration—The Secretary, Royal Infirmary, Bradford.

Senior Research Assistant (postdoctorate physicist), to undertake research using rockets and satellites; a Senior Research Assistant (post-M.Sc. or Ph.D. mathematician or physicist), to undertake research and to set up and supervise arrangements for data handling (including the use of automatic computers); Junior Assistants (female, with advanced level mathematics, G.C.E.); an Electronic Technician (with initiative, and able to undertake accurate assembly of rocket and satellite electronic systems, and to take part in experiment and testing); and a Draughtsman (with initiative and ability for detail, and willing to take part in practical development work) in the Space Research Group in the Physics Department—The Secretary, University College, Gower Street, London, W.C.1, marking envelope "For the attention of Dr. R L. F. Boyd".

INDUSTRIAL RESEARCH ASSOCIATIONS: SOME TAXATION PROBLEMS

IN discussing recently the report of the Pritchard Committee on the 'rates' charged by local government authorities against charities and kindred bodies in Britain, passing reference was made to the position of the industrial research associations (*Nature*, 184, 1343; 1959). It was stated that the Committee had heard oral evidence from the Parliamentary and Scientific Committee urging that a new statutory relief of 75 per cent should be allowed to industrial research associations. The report notes that under section 449 of the Income Tax Act, 1952, industrial research associations enjoy the same reliefs from income tax as do charities, but the Pritchard Committee submits that the research associations are much more akin to the research establishments of individual firms in industry than to charities. Accordingly, the Committee recommended that the relief considered appropriate for research establishments conducted by individual firms within the curtilage of their industrial hereditaments should be extended to premises of industrial research associations.

The Pritchard Committee, which rightly points out that the treatment for rating of separate hereditaments occupied by individual firms for industrial research is outside its terms of reference, claimed that its view in this matter corresponds to that expressed in evidence by the Department of Scientific and Industrial Research. The report, however, does not indicate the nature of the argument submitted for a new statutory relief of 75 per cent, and in particular, Lieut.-Commander Christopher Powell, secretary of the Parliamentary and Scientific Committee, has pointed out to the Editors that research associations do not at present enjoy the benefit of industrial de-rating. In the view of the Parliamentary and Scientific Committee they should enjoy that benefit, and the figure of 75 per cent recommended was chosen because, when the evidence was submitted, industrial de-rating amounted to 75 per cent.

The memorandum submitted in evidence by the Parliamentary and Scientific Committee points out that research associations do not at present enjoy this benefit of industrial de-rating, because their premises do not fall within the definition of the class of industrial hereditaments comprising 'factories' and 'workshops' in that they are not conducted "by way of trade or for purpose of gain". There is the additional doubt whether 'manual labour' is exercised as required by the definition, when regard is had to the nature of the duties of laboratory workers and research assistants. The research associations might have taken up the matter when legislation affording rating relief to industry was under review, but at the time and until 1948 they were under the impression that they would continue to enjoy the benefits of the Scientific Societies Act.

While it is true that the research associations, which at present enjoy no rating relief of any kind, will obtain 50 per cent relief from rates if the proposals of the Pritchard Report are implemented, so long as that is the percentage of relief accorded to industry, the undoubted anomaly will remain that premises of a commercial concern on which research and development work is carried on may obtain partial exemption from rates, while those of a scientific research association as such obtain none. Associated with this anomaly is the fact that if industrial research and development work by a commercial concern is carried out in a factory hereditament where the predominant activity is production, it can come under the umbrella of industrial de-rating relief afforded to the factory as a whole, but if it is carried out in a separate hereditament full rates have to be borne on that hereditament. The Parliamentary and Scientific Committee submitted that the correct action is to put all premises of the commercial concern in which industrial research and development work proceeds on the same footing regardless of whether or not they form part of the factory.

This is so obviously the logical policy that there can be little doubt that it expresses the general view of the scientist and technologist, and it should be pressed again when the proposals of the Pritchard Committee come before Parliament. Indeed, it is reasonable to claim that research associations have an even stronger claim to rating relief than premises on which a commercial concern conducts research and development work. As the Parliamentary and Scientific Committee urged in its evidence, the research associations do not make profits and cannot pass on the increased cost of their work to the public as can a commercial concern which sells its products. They have educational functions in connexion with training schemes, and their activities educate their member firms in science and technology, sometimes also incidentally, it might be noted, assisting the supply of technically trained staff. Much of the outcome of their work is published in the scientific Press, and their services to technological education should not be overlooked. Notwithstanding that their primary duty is to serve the industries which contribute to their support, their fundamental aim is to see that newly won scientific and technological knowledge is applied throughout British industry.

These public benefits, the extent of which depends on the magnitude of the financial support the associations receive, are every whit as worthy of consideration as their contribution to keeping their industries in the forefront of scientific achievement, which is the fundamental reason why relief from rates is claimed for them. The Parliamentary and Scientific Committee recognizes that privately owned commercial concerns benefit substantially from the work of the research associations, and for that reason does not claim full exemption in the way that it is claimed for scientific societies and institutions. It makes instead the sound claim that the public benefit arising from the work of the research associations justifies relief of 75 per cent from rates, and this relief should stand, independent of whether or not industrial de-rating generally is continued. To that extent, and apart from the specific figure recommended, the Parliamentary and Scientific Committee goes appreciably further than the Pritchard Committee, the report of which does not indicate the full considerations on which the claim is based.

WHITE WILDERNESS

Arctic Wild

By Lois Crisler. Pp. xii+274+60 photographs. (London: Martin Secker and Warburg, Ltd., 1959.) 25*s*. net.

LOIS CRISLER, courageous wife of a professional camera-man engaged in filming arctic wild life for a well-known film company, lived with her husband for two summers and one winter, in tent or flimsy hut, almost entirely alone in the barren wilderness of the Brooks Range in north-western Alaska. During most of this time the two saw no human beings other than the bush pilot who supplied them with the essentials of life at long and irregular intervals, when the weather or the landing conditions did not make his hazardous flights too risky. But they shared a mutual sympathy with, and a dedicated understanding of, the wild life around them. To these two, the tundra, mountains and rivers, in all their changing aspects through the seasons, meant an opportunity to know life much nearer to the primitive than most educated, civilized human beings could ever hope to experience.

To enable them to work unhindered by interference from the occasional Eskimo hunter, and to study and film the undisturbed caribou and wolves, the area in which they lived and worked was made a temporary sanctuary. They themselves carried no firearms. One result of their sojourn in the wilderness, and perhaps the most important one, is this book. It is the work of a writer dedicated to the cause of the conservation of the wild places of the Earth and of the wild animals without the presence of which the face of the Earth remains empty and dead. The picture presented here, in terse but vivid language, is of the wild life of a region that modern man, with his craze for killing and destruction, has still scarcely scratched—the last wilderness of North America. But the frightening hint we are given of what the future holds for this land is depressing enough. As the Crislers flew south from Alaska, their work finished, the mass invasion of the Far North by the military and other personnel engaged in the creation of the *DEW*-Line for the radar defence of the continent was bringing into the wilderness thousands of outsiders to whom any living thing was a target and nothing more, to be killed or wounded indifferently.

To the naturalist, and particularly to the animal behaviourist, this book is a revelation. The main objective of the Crislers was to observe and film, in all possible aspects, the interwoven lives of the caribou in their great migrating herds, and of their attendant predators, the wolves. These are the two most important large mammals of the north. The observations of the writer and her husband form the first clear-cut account of the relationship of the two species. They found that the fit and healthy caribou, even the quite young fawns, were able to outdistance the hunting wolves with comparative ease. In almost all cases investigated it was found that the caribou killed were those hampered by disease, old age, or injury of some kind. The natural role of the wolf, in fact, is as the culler of the unfit, Nature's method of limiting the undue multiplication of the herds. How delicate the balance, and how disastrous the effects of interference with it, is shown by the quoted instance of the effect of wolf 'control' on the Nelchina herd of Alaskan caribou a few years earlier. From an estimated total of 4,000 animals, in ten years the figure, without the limiting factor of wolf predation, had risen to the startling total of about 10,000. The available winter range was no longer sufficient, and the consequent trampling and over-grazing threatened the livelihood of the excessive caribou population. Yielding to wiser counsels, the U.S. Fish and Wildlife Service reversed its former policy and gave complete protection to the wolves in that area. Elsewhere in Alaska a 50-dollar bounty on each wolf sets every man's hand against them and poisons men's minds against their continued existence.

The Crislers' attitude to wolves provides the meat for the most engrossing chapters of this book. They tell of the hand-rearing of wild wolf cubs, and the subsequent sharing of their lives. First two cubs were reared to maturity, and in the second season an entire litter of five, dug out of their den, were brought up by hand and allowed to develop their individual personalities as naturally as possible. In both cases the young wolves regarded the Crislers as their parents, learnt to accompany them on their daily outings on the tundra, to return home after a day's freedom to the pen which was their life's centre, to romp and play, roughly but without malice, with their human substitutes for wolf parents. Naturally this gave unequalled opportunities for detailed study of wolf psychology and behaviour patterns. The results, told with a complete and refreshing absence of the usual animal behaviourist's technical jargon, provide an enthralling story. The excellent photographs, showing adult wolves playing boisterously with their 'foster parents', indulging in communal howling practice with the humans joining in, or accompanying them on their caribou camera hunts, show that the text does not exaggerate the astonishing degree of trust and friendship between wolves and humans. There is rich material here for the student of animal behaviour, and particularly for the student of the origins of the domestication of the dog, to which the wolf is demonstrably so closely akin. The description of the male and female adult wolves, themselves not yet mated, adopting the litter of five young cubs and making it their business to provide all their food in the form of caribou meat carried home in the wolves' stomachs to be disgorged in front of the cubs, is a striking example of the inherent selflessness and gentleness of wolves towards young not even their own.

This is probably the most important study of wolf personality and reactions that has yet been made. I could only wonder at and admire the unafraid trust placed by the Crislers, alone, unarmed, and 90 miles from the nearest help, in these adult wolves, living a practically free and uncontrolled life, yet looking to these two humans for leadership, companionship and play. They admit, casually enough, that at times they had doubts about the reliability of their wolves, but the only moments of trouble and stress came when unfamiliar sights, sounds and persons troubled the animals. To them any break with the familiar pattern of their lives spelt insecurity and danger, and they reacted accordingly.

It will be a very long time before a book as sympathetic to wild life as this (yet without sentimentality or anthropomorphism), and at the same time so readable, is likely to appear. The only criticism I have to make is that the provision of a map would have helped readers to follow the Crislers' journeys and references to Alaskan place-names connected with their work. R. W. HAYMAN

PREHISTORY OF SOUTHERN RHODESIA

Inyanga

Prehistoric Settlements in Southern Rhodesia. By Roger Summers. With contributions by H. B. S. Cooke, P. V. Tobias, H. Wild, J. F. Schofield and K. R. Robinson. Pp. xviii + 336 + 22 plates. (Cambridge: At the University Press, 1958. Published for the Inyanga Research Fund.) 50s. net.

ROGER SUMMERS and his collaborators here describe the fruit of six months field-work under the auspices of the Inyanga Research Fund during 1949–51. Their object was to discover the age and purpose of the stone-walled ruins and terraces that cover between two and three thousand square miles on the Inyanga Highlands of Southern Rhodesia. Summers and his co-workers found that the walled settlements, now in ruin, were built by a prehistoric Iron Age community that displaced the Stone Age inhabitants of Inyanga apparently between the seventh and fourteenth centuries A.D. The reader may ask why we use terms like 'Stone Age' and 'prehistoric' for such recent times, but it must be remembered that, until the nineteenth century, most of Africa south of the Sahara either remained untouched by the great civilizing events that brought writing to the Mediterranean world, or reflected them in part only.

Our previous knowledge of the ruins depended on a few short papers. Now Roger Summers has given us a full monograph, while specialists contribute the latter half of the book on other aspects of the archæology, botany, surface geology, animal and human palæontology of the area. Their enthusiasm carried them beyond the limits of the Iron Age, down into Stone Age depths, for K. R. Robinson contributes a chapter on people who lived in Inyanga long before the Iron Age stone-wall builders arrived there.

Summers's account of the Iron Age at Inyanga is based on no less than thirty-six excavations within an area of 800 square miles. I congratulate him on achieving the aims of the sponsoring Fund, and presenting such an interesting account of the framework of the thriving population that based its way of life on the terraces, trackways, water furrows, stone buildings and pottery it left in this region. Here, too, is an account of the metal-producing techniques that supplied the spears, axes, hoes and knives necessary to the economy and its defence; and also the east coast trade that for centuries poured millions of glass beads and other objects into African Iron Age communities. These beads give some indication of absolute dating, as J. F. Schofield's valuable chapter suggests; but in general these things have an age-range too wide for any but the broadest dating.

P. V. Tobias interprets the two Iron Age skeletal remains as representing a Negro and a Boskopoid–Negro hybrid, anatomical characters found in the present-day Bantu-speaking population in Rhodesia. There may be little doubt that the Iron Age remains in Inyanga are due to their ancestors, and not to any exotic people.

Summers distinguishes two main Iron Age cultures in Inyanga. The earlier cultures may have flourished between the seventh and eighth centuries A.D., but could be as late as the fourteenth century A.D. The scarcity of foreign imports supports the earlier date; indeed, accurate radiocarbon age estimation may show it to be even earlier. Recent radiocarbon dates for Iron Age settlements in Northern Rhodesia suggest that metal-producing farmers may have arrived in the area centuries earlier than our previous conjectural dating based mainly on imported beads.

The later cultures produced the astonishing terraces, stone-lined pits, roadways and water-channels which are such striking features of the Inyanga landscape, as aerial photographs in the book show. These Iron Age people had a thorough grasp of soil conservation, for they made miles of contoured terraces for grain fields and built massive stone walls across gullies to stop soil erosion.

Summers gives a study of the environmental background to Iron Age life, but the reconstruction of climatic change on the basis of erosion and deposition is considered uncertain in view of recent South African research which, in my opinion, has done much to disprove the traditional hypotheses of this kind. Few specialists would accept a chronology based on the hypothetical climatic changes Summers proposes in his concluding chapters.

The archæological remains described in this book are as impressive as Zimbabwe, but it is unfortunate that Summers omits clear comparison with that well-known centre and its associated settlements. I hope he will give us a third book relating Inyanga and Zimbabwe to each other and to all other Iron Age remains in Rhodesia that interest both the archæologist and the general observer of African achievement in the past.

The book reaches the usual high standards of the Cambridge University Press; the line drawings are excellent, but the photographs could have been improved by 'bleeding' the blocks for reproduction.

REVIL MASON

EVOLUTION FOR THE GENERAL READER

Nature and Man's Fate

By Prof. Garrett Hardin. Pp. xii + 375. (New York: Rinehart and Company, Inc., 1959.) 6 dollars.

IN their introductory remarks the publishers of Prof. Hardin's book on evolutionary theory and the course of human evolution describe it as "challenging", "provocative" and "controversial". Even though words of this kind have been used so much that they have lost a great deal of their original force, there is little doubt that "Nature and Man's Fate" will bring pleasure to all those who prefer to see the truth set down in terms of black and white.

The plan of the book is on orthodox lines. The emergence of the theory of evolution as set out by Charles Darwin and A. R. Wallace is preceded by accounts of earlier theories and the intellectual and emotional atmosphere which existed when "The Origin of Species" was published. This is followed by the story of how evolutionary theory gathered momentum and support with the re-discovery of the Mendelian laws of heredity. The latter part of the book explores the significance of genetics in human life and development. In general, the historical and factual part of Hardin's book is remarkably good, mainly because of the interesting and often novel anecdotes and reminiscences which the author produces to support the theories and philosophies of the leading *personalia*.

When Hardin begins to speculate, however, he adopts the overbearing attitude so typical of those who see the world devoid of any shade of grey. Darwin is chided for his lack of mathematics, his support of pangenesis, and his inability "to discover genetics". All Lamarkists are banished from court. "Samuel Butler and St. George Mivart were intensely proud and personally ambitious far beyond their small abilities". It would be interesting to hear Hardin's assessment of a well-known English professor of zoology who advocates that more may be heard of the inheritance of acquired characteristics when the possibilities of cytoplasmic inheritance have been further explored. In his attack on the Soviet attitude to genetics—which is weakened when Hardin adopts the approach of a journalist rather than a man of science—Needham, Bernal and Haldane are accused of something almost verging on intellectual dishonesty. All this to support Hardin's strongly held view that what evolutionary theory and genetic laws have taught us is the essential need for competition if human life is to go on.

It is a pity that the author has spoilt what might have been a good book with over-protestation. "Nature and Man's Fate" should bring him much publicity but little credit. T. H. Hawkins

Heat Exchangers

Applications to Gas Turbines. By Dr. W. Hryniszak. Pp. xii+343. (London: Butterworths Scientific Publications; New York: Academic Press, Inc., 1958.) 63s.; 10 dollars.

THE second volume of the late Prof. M. Jakob's treatise on "Heat Transfer", completed under the guidance of his colleague, Prof. S. P. Kezios, maintains the very high standard set by the first. The first volume left over for consideration the solution of the equations for radiant heat transfer in non-absorbing and absorbing media, a topic which occupies the first quarter of this second volume. The greater part of the book deals with selected fields of application in heat-transfer engineering, discussing first the well-established topics by giving a mathematical treatment of recuperative and regenerative heat exchangers and cooling tower theory. There follows consideration of the newer branches of study in the science of heat transfer, including transpiration cooling and cooling by falling liquid films, heat transfer problems encountered at high fluid velocity through laminar and turbulent boundary layers, and concluding with chapters on heat transfer in liquid metals and in packed columns. A supplement brings up to date some of the material in Volume 1, though none of the many literature references given throughout the book is carried beyond 1953, and indeed those relating to regenerator theory do not go beyond 1940. Presentation of further material is held over to a later edition of the treatise. The two volumes together form an indispensable work of reference for the libraries of all heat transfer laboratories.

Prof. Kay's book is based directly on a university course of lectures in chemical engineering. Picking up this book after Prof. Jackob's two volumes, one wonders how the author has compressed into a modest volume an introduction both to heat transfer and fluid mechanics. This has been achieved by an admirably concise mathematical treatment of his material, but also by omitting entirely consideration of radiant heat transfer and any solution of the unsteady state conduction equations The particular strength of the book lies in the successful manner in which it inter-relates and interweaves the phenomena of fluid flow, mass transfer and heat transfer. The author makes use of vector notation to an extent which need not cause undue difficulty to one to whom it is unfamiliar, though it seems inappropriate to introduce the simple concept of thermal resistance via equations written in vector notation. While there are a few short chapters at the end of the book dealing very briefly with applications in process engineering, the absence of any worthwhile mention of two-phase flow problems is surprising in a book written for chemical engineers. One suspects that this is because their study lends itself less readily to the neat and tidy mathematical treatment which features so largely in this book.

The book by Dr. Hryniszak is in a different category from the two others. While Prof. Jakob's is likely to appeal most to the postgraduate student and research worker and Prof. Kay's to the more able undergraduate, Dr. Hryniszak's would make little appeal to either, for it is essentially a book for the specialist in gas-turbine heat exchangers. Although the non-specialist student might find some interest in the sections dealing with the mechanical aspects of recuperative and regenerative heat exchangers, he would find little attraction in the manner of presentation of the theoretical matter; for in an attempt to keep the mathematics as simple as possible, the theoretical relations are frequently presented as complicated formulæ with little in the way of derivation. Consequently, the contents of the book too often resemble extracts from a design manual, and such manuals seldom make exciting reading. Only the specialist will have the patience and inclination to dig deeper if he wants to compare the author's methods with his own. The volume deals not only with the heat exchanger but also, in optimization procedures, treats it as an integral part of the gas-turbine plant. R. W. Haywood

Pictorial History of Philosophy

By Dagobert D. Runes. Pp. x+406. (New York: Philosophical Library, 1959.) 15 dollars.

THIS handsome volume includes approximately 1,000 portraits, photographs, facsimiles, archæological illustrations and other pictorial material connected in one way or another with philosophy. The net is cast very widely; Goethe, Hitler, Buddha, massacres of the Jews by the Crusaders, photographs of practices by adherents of Yoga, compete for attention with the more conventional practitioners of the craft, such as Aristotle, Cicero, Duns Scotus, Husserl, Wittgenstein and Dewey. Although the principles of exclusion are not obvious, the effect is to have here a collection of philosophical portraits of a range which it would be hard to find elsewhere. Title-pages from important classics are liberally spread throughout the volume, as well as dramatic scenes from the general history of thought and religion, for example, Calvin arguing with Farel, alchemical laboratories, the dying Seneca, Pericles addressing the Athenians. There is less to be said for the literary entries that accompany the illustrations. They vary from a sixth to a third of one page, Kant getting rather less than, say, Carlisle, Croce or Russell, and too frequently mention what is trivial and biographical at the expense of an accurate appraisal of a person's thought. The page facing Russell's portrait shows Stalin, and that with Heidegger has Hitler's portrait: the author makes no bones where his sympathies lie; deeply pro-Jewish, with a full page for "Lincoln, Sage and Seer", and a penchant for the wisdom of the East. Perhaps, though this may introduce an amateurish note, the feelings that emerge are none the worse for it; and if one would not want to learn one's philosophy from it, one must be grateful for the very many rare photographs such as a daguerreotype of Schopenhauer or others of Lloyd Morgan, Alexander, Bradley, Bosanquet; all reproduced with magnificent quality.

GERD BUCHDAHL

Theory and Applications of Nuclear Induction

By Prof. Ajit Kumar Saha and Tara Prasad Das. Pp. x+516. (Calcutta: Saha Institute of Nuclear Physics, 1957.) Rs. 25; 40s.; 6 dollars.

BY and large, there is only one thing wrong with this book—its date of publication. The reviewer's natural sympathy is with Prof. Saha, who completed the task interrupted by his father's death in 1956. But a manuscript completed in 1953 and only slightly revised before receipt in 1959 (although dated 1957). is not in keeping with the pace of physics to-day. The book is written primarily with the experimental scientist in mind; it covers relaxation time and moment measurements, quadrupole effects and chemical shifts in detail. Some mathematical ability and a knowledge of the language of quantum mechanics is assumed, but the arguments are presented in such detail that it should be easy for those learning the subject to follow them. In the authors' own words, "the attitude has been to discuss elaborately the phenomenological theory and the experimental techniques". They have achieved this aim, but it is of course the weakness of phenomenological theory that it covers only the cases discussed; extension and generalization are hazardous. The notable example of this difficulty is in the absence of a treatment of negative-spin temperatures.

The book is well printed, well indexed, and an errata sheet bound into the volume has corrected a good many minor slips. The bibliography is excellent up to 1956, and the book will save a good deal of searching of the literature before that date.

W. M. LOMER

The World is Round

The Story of Man and Maps. By Prof. Frank Debenham. Pp. 100. (London: Macdonald and Co. (Publishers), Ltd., in association with Rathbone Books, 1959.) 50s. net.

"THE World is Round," by Prof. F. Debenham, is "a far cry from those primitive attempts to the drawing of actual maps". The evolution of man's cartographical skill has been achieved by the use of vivid colour reproductions of imaginary world maps and ancient charts. Having traced man's global knowledge to the present day, the author uses specially designed colour relief maps to show the world as we know it to-day. Many unfamiliar sectors of the Earth are revealed and each continent is shown in relation to its neighbour, thus bringing out many points of comparison hitherto unrealized. Prof. Debenham avoids stress on one country more than another, and points out a sociological moral through a geographical fact; the Earth is indeed round, but its centre is not the place where we live.

The pages dealing with the historical background of each country are, in my opinion, out of place in a book of this kind, and tend to detract from its main purpose. From a concise section dealing with map-making instruments through the ages the reader is led to a review of man's latest inventions in mapping under the sea, under the land, and in outer space. This is a beautifully presented book that would not only provide a most useful aid in the school library but also would grace the shelf of any home.

M. CARADINE

La Vie des Colibris

Les Trochilidés. Par Ariane Martin et Anne Musy. (Les Beautés de la Nature—Série Exotique.) Pp. 246+32 planches. (Neuchatel: Éditions Delachaux et Niestlé, 1959.) n.p.

HUMMINGBIRDS, like butterflies and birds' eggs, are natural objects which interest the collector as well as the scientist; they are, as described in this book, "living precious stones" showing a fascinating variety of colour and form within the limits of their distinctive and homogeneous group. Although the object of the series to which this volume belongs is to extol the beauties of Nature, it is the biology rather than the art of hummingbirds which is the theme.

The text consists of a short historical note and chapters on geographical distribution, structure and morphology, temperature regulation, locomotion, food, reproduction and behaviour. These subjects are, of necessity, very briefly summarized. It is not widely known that hummingbirds have a temperature-control mechanism, so that in certain circumstances they can become torpid. Hibernation, in fact, was described in hummingbirds a long time ago.

To those who know little or nothing of these fascinating creatures this book conveys a fair summary of the facts of their biology. The text provides informative reading for the interested layman who, if he understands art, might also appreciate the colour plates.

J. D. MACDONALD

GEOMETRY OF THE STRUCTURE OF MONATOMIC LIQUIDS

By PROF. J. D. BERNAL, F.R.S.
Birkbeck College, University of London

SINCE the work referred to in my communication to *Nature* early in 1959 [1], it has been possible to approach the problem in a more quantitative way by the use of computers and geometrical models. Following up the concept of a liquid as an essentially irregular assembly, I have been able to realize a mathematical model of such an assembly, thanks to the help of Dr. A. D. and Mrs. Booth at Birkbeck College, and of the University of London Computer Unit through the work of my son, Dr. M. J. M. Bernal. A method was devised for computing the co-ordinates of centres of random assemblies of hard spheres with the one condition that no two centres should approach at less than a minimum distance. It proved possible to arrange these in systems with varying densities, the chief interest being, however, in the arrangements of highest density. Later it was possible to build up such arrangements with as many as seventy-five spheres in various ways, to compute from these their mutual energies on the simple Lennard-Jones $-A/r^6 + B/r^{12}$ potential rule and also to determine their effective volumes.

The general picture which emerged was that each particular random arrangement could be altered in absolute scale so as to get a minimum energy for each mutual relative metric position of the points. It could further be modified without preserving these metrical relations but yet maintaining the same topological neighbourhood relations so as to get even lower energy values.

From these minimum energy arrangements it is possible to calculate mean radial distribution functions (Fig. 1). These resembled roughly those obtained experimentally by X-ray and neutron diffraction from monatomic liquids. Dr. Furukawa has shown[2] that nearly all metals show the same distribution function if these are calculated from their observed diffraction curves in the same way. The distribution functions derived from the random arrangement described are similar to this with the significant difference that the first or principal maximum is considerably broader in the model. Now this is exactly what should be expected from the way the model was derived by emphasizing minimum rather than most probable distances of neighbours, for it proved impracticable at this stage to devise a programme which ensured arrangements with a maximum of molecular contact.

To overcome this difficulty, I used a semi-empirical device by building an actual physical model corresponding to the machine-calculated distances. Then, after joining neighbouring points by links of variable length, devised by my technical assistant, Mr. J. Mason, I was able, by a process of manipulation, to reduce most, but by no means all, of the distances between neighbouring points to approximately identical minimal values. This gave a new kind of distribution function (Fig. 1) with much sharper peaks, sharper actually than those given by metallic or molecular liquids (Fig. 1) but more closely approximating to them than in the first model. It also gave a density of packing of 0·61, approaching the value of 0·63 determined by G. D. Scott, (private communication) for irregularly close-packed spheres.

It is evident that this model, by an intermediate degree of equalization of the shorter bonds, could be made to provide radial distribution functions approximating, within experimental limits, to those calculated from diffraction curves. This agreement provides strong support for the principles of construction of the geometrical model proposed for liquid structure. Although, on account of the inherent phase ambiguity of diffraction studies, it is impossible to *prove* the correctness of the model by these means, it equally cannot be disproved, and it must correspond more closely to the real distribution than any model hitherto proposed. Its closest affinity is, in principle, to that of Furukawa[2], who was the first to explain the location of the second peak of the distribution function.

A contemplation of the bond-equalized model led me to the radically new conception of the ***ideal structure of a liquid***, ideal in the sense that in such a structure all the distances between closest neighbours are equal. This ideal corresponds to the ideal structures in crystallography by which, for example, Pauling worked out the structures of the silicates. Actual structures, however, differ, and it is certain that no actual liquid structure can be an ideal one, though it may be close to it.

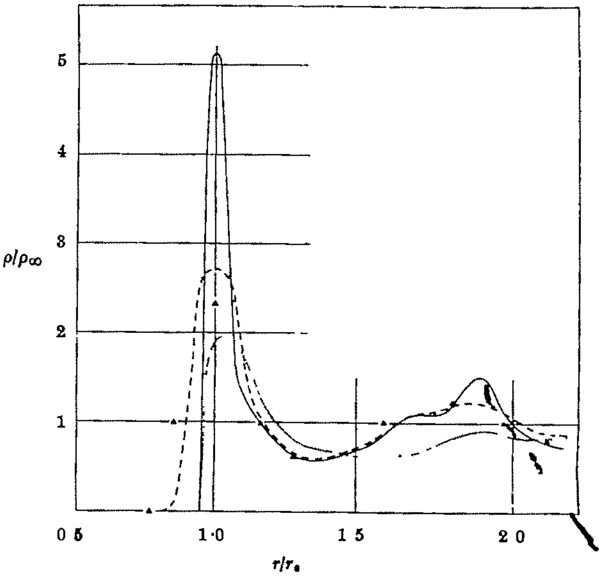

Fig. 1. Density distribution function: ρ/ρ_∞ variation of mean particle density as a function of r/r_0

. . , Derived from calculated random model; ——, derived from squeezed random model; - - - -, calculated for lead by Furukawa (ref. 2); ▲▲▲▲, calculated for liquid argon by neutron diffraction (Henshaw, D. G., *Phys. Rev.*, 105, 976; 1957)

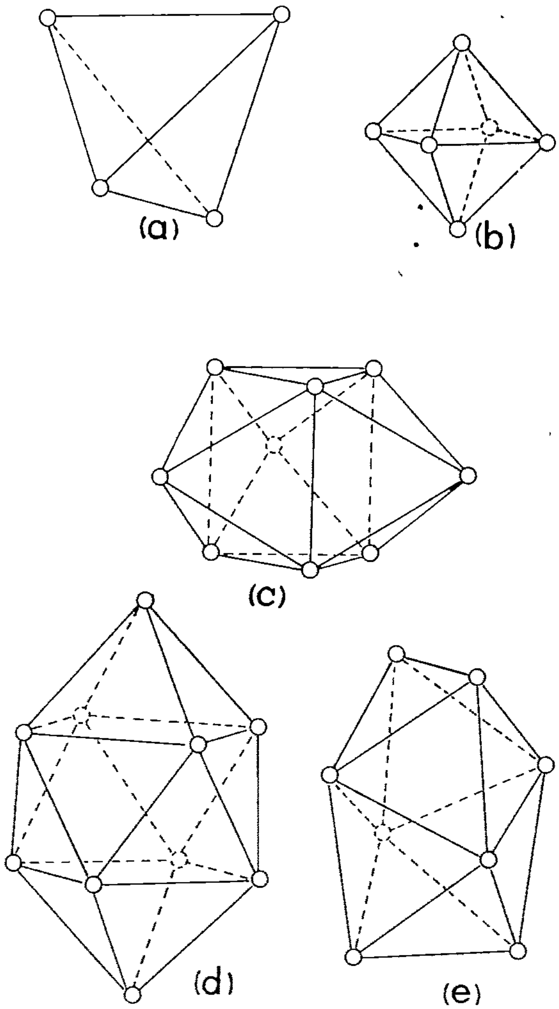

Fig. 2. Forms of holes in ideal equidistant molecule model of a liquid. *a*, Tetrahedron; *b*, octahedron; *c*, trigonal prism capped with three half octahedra; *d*, archimedean antiprism capped with two half octahedra; *e*, tetragonal dodecahedron. (Note prevalence of five-fold surface co-ordination in *c*, *d* and *e*)

Examination of the model showed that it could be considered most profitably as broken down into a set of *polyhedral* holes between molecules. These polyhedra are necessarily small because, by definition, in any coherent *close-packed* liquid there are no holes large enough for another molecule to be inserted. All have in common faces composed of equilateral triangles, or, in other words, *all their edges are equal.* They can, in fact, be derived from five ideal basic shapes: two platonic, two regular archimedean polyhedra, and one of lower symmetry. These are the tetrahedron, the octahedron, the trigonal prism, the archimedean antiprism, and another eight-cornered form, the tetragonal dodecahedron (Fig. 2). These forms can be combined in an unlimited number of ways through the sharing of triangular or square faces (here the half octahedron can appear as a pyramid on a square base). There are no other forms with equal edges, though a relaxation of this rule allows a few other kinds of holes to occur. However, *in general,* such packing cannot fill space without breaking, though to a degree limited to some 15 per cent, the condition of the equality of nearest neighbour distances. The introduction of archimedean polyhedra prevents any long-range order and also prevents a realization of the ideal structure precisely; for the sums of the dihedral angles of the polyhedra can never (except in the case mentioned below) be made exactly to amount to four right angles. In one particular case, that where only tetrahedra and octahedra occur, the packing can be regular, giving rise to varieties of cubic or hexagonal close-packed crystals.

It is possible, therefore, to formulate the geometrical hypothesis of the structure of liquids as follows:

In an *ideal* liquid structure, the molecular centres lie at the apices of a set of empty polyhedra (holes) with equal edges (r_0), or a combination of them. These polyhedra are: platonic regular (1) tetrahedra; (2) octahedra; archimedean (3) trigonal prisms; (4) archimedean antiprisms; and (5) tetragonal dodecahedra. The presence of the three latter forms prevents any long-range order and thus permits fluidity appropriate to temperature, while their proportion determines the configurational volume of the structure at different temperatures. For any temperature the structure is characterized only by the mean value $\overline{N}$ of molecular neighbours, varying from 11 to 3 as the temperature rises, and by the variance (λ) of the intermolecular distance (r_0), which increases with temperature.

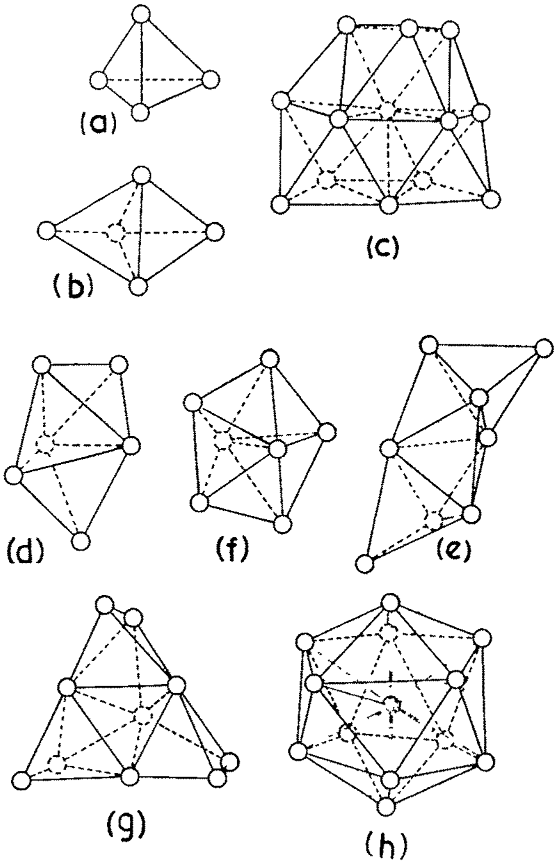

Fig. 3. Crystal nuclei and pseudo-nuclei built from equidistant or quasi-equidistant molecules. Crystal nuclei. *a*, single; *b*, double tetrahedra; *c*, close-packed layers, four tetrahedra and three octahedra. Pseudo nuclei: *d*, three; *e*, four tetrahedral elements of super close-packed spiral chain; *f*, five tetrahedra in pentagonal bipyramid; *g*, seven tetrahedra with elements of three spiral chains; *h*, twenty tetrahedra as fitted in an icosahedron. (In *f* and *h* all the intermolecular distances cannot be precisely equal)

This concept of the ideal structure also opens the way to a real statistic of liquid structure, the relative numbers of the platonic and archimedean polyhedra, depending on the temperature, giving the possibility of determining a mixing entropy to account for the large entropy of the liquid state. This would seem to provide a geometrical basis for Eyring's[3] partition function in his new thermodynamic theory of liquid structure. It can be seen that this geometric view contains the essential features of many earlier theories of liquids, including that of Born and Green[4] based on gas laws, the hole theory of Kirkwood[5] and Frenkel[6] and the crystallite theory of Eyring and others, and points to their eventual reconciliation.

With regard to the last of these, it is apparent from the model that even the most irregular structure contains regions composed of a number of tetrahedra sharing faces. Even though their density may be greater than close packing, as Boerdijk[7] has shown, they are not in general crystalline, but are asymmetric or have forbidden symmetries, such as pentagonal (Fig. 3). They cannot lead to three-dimensional repeat structures and consequently cannot function during the time of their stability as nuclei of crystallization. This may indeed provide the explanation of the phenomena of nucleation and crystal growth in super-cooled liquids. The character of these pseudo-nuclei near their melting point may well be dependent on whether they are formed from the melting of a crystal or from the cooling of a liquid heated to a high temperature. This may also explain some observed hysteresis phenomena in liquids near the melting point. It also implies that with poly-atomic molecules there may be several degrees of melting or break-up of such non-crystallographic aggregates which may help to account for viscosity anomalies with temperature which will appear not as discontinuities but changes of higher order. Further, the existence of such condensations indicates the necessity of fluctuations in density in normal liquids of the dimensions of several interatomic distances as postulated by Furth[8].

A fuller account of this work will be published elsewhere.

SALTS AND RESPIRATION

By PROF. H. LUNDEGÅRDH

Penningby, Sweden

ANIONS and cations of inorganic salts are non-metabolically absorbed by the protoplasm, a process obeying common principles of ion exchange and Donnan equilibrium[1], but metabolic energy is always needed for accumulation of these salts in the vacuoles[2,3]. Even if the initial salt absorption of the protoplasm is a spontaneous process, it is important to realize that the power of salt absorption of the protoplasm, namely, the amount of ion carriers (symbolized as R^- and R^+), is also metabolically regulated[4]. Little is known about the chemical nature of the carriers. They behave as large organic ions and reflect the ionic activity of the protoplasm itself. Normal aerobic respiration is needed for maintenance of the structural qualities of the protoplasm. The activity of the ion carriers is concommittantly more or less abolished if the cells are poisoned by cyanide[4].

From a biochemical point of view the pronounced sensitivity to cyanide points to co-operation of the cytochrome system in the absorption and accumulation of salts. This conclusion had been drawn in 1935[2a]. Later on, direct observations of the response of the respiratory enzymes to presence or absence of salts were made[5]. Rapid measurements of the height of absorption bands of reduced cytochromes a_3, a, c and b of a bundle of wheat roots showed that the bands are high if the roots are 'desalted', that is, thoroughly washed in distilled water, and decrease in height upon addition of 0·001–0·005 M solutions of neutral salts or dissociated salts of organic acids (see Fig. 2). Recent results show a similar response of diphosphopyridine nucleotide and flavoprotein, which are also participating in the respiratory chain. The response to salts is thus confined to the *total* respiratory system, not only to single enzymes.

Discussions of the mechanism of salt accumulation are frequently hampered by ignorance of this distinction between 'initial absorption' and 'continued accumulation'[4,6]. A large number of cells, among them most animal cells and meristematic cells of plants, have much less 'free water' than fully grown cells of plants, in which the sap space may occupy more than 95 per cent of the total volume. The process of continued accumulation is consequently much more dominating in the latter. A question of considerable theoretical interest was raised by recent observations of a sudden stimulation of aerobic respiration upon addition of salts, namely, stimulation occurring in the initial period before the full start of continued accumulation[4]. Because in plant tissues the two phases of absorption are fairly close together in time (the phase of accumulation starts about 15 min. later than the initial absorption), a closer study of the problem required an organism in which salt accumulation takes a subordinate role. Baker's yeast is such an organism. Most inorganic salts pass into the yeast cell, but no significant accumulation above the level in the medium was observed. Yeast is provided with a complete cytochrome system which, in co-operation with pyridine nucleotide and flavoprotein, maintains a fairly intensive aerobic respiration.

The Salt Effect on Baker's Yeast

Suspensions (5–15 per cent) of washed baker's yeast were investigated in the Barcroft–Warburg

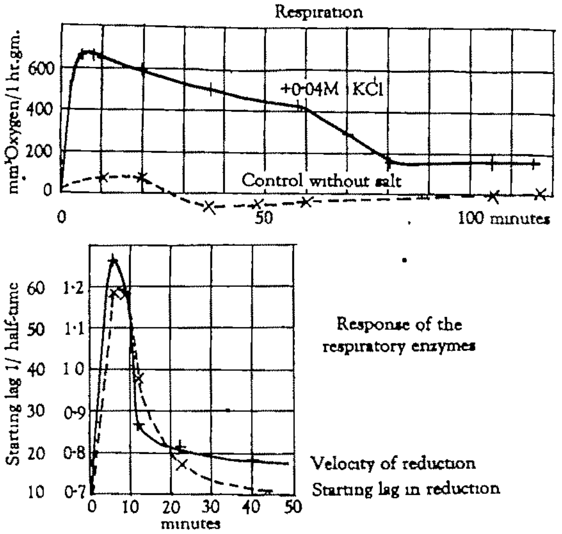

Fig. 1. Response of oxygen consumption (above) and activity of the respiratory enzymes to an addition of 0 04 *M* potassium chloride to a suspension of washed baker's yeast. Identical vessels were investigated, one set without and one with salt. The initial rapid burst of respiration is recognized both in oxygen consumption and reaction of the enzymes

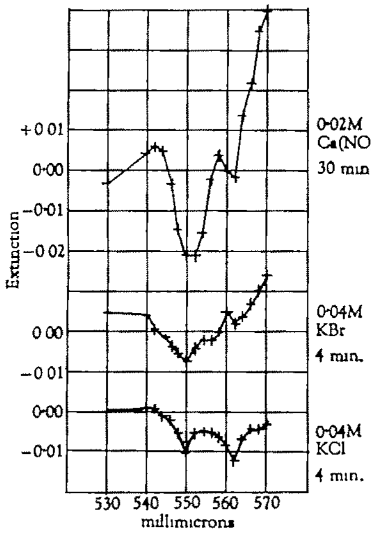

Fig. 2. Response of the cytochromes *c* (550 mμ) and *b* (562 mμ) to an addition of salts Difference spectra were recorded, one quartz vessel (see ref. 7) containing yeast without salt, the other with salt. 1 per cent glucose was added to both vessels in order to obtain 90 per cent reduction from the start. The response on salts implies lowering of the reduced peaks

respirometer and simultaneously in recording spectrophotometers of my own construction[7]. The spectrophotometric observations were carried out according to the procedure developed in my laboratory for studies of the kinetics of the respiratory enzymes, namely, difference spectra were recorded between control (in water) and sample (with salt). Records were made during consecutive time-intervals. For the determination of start lags and apparent reaction velocities of reduction and oxidation, intermittent gassing with nitrogen or air respectively was used, according to a previously elaborated technique[8]. The spectra were in this case recorded by means of a rapid-scanning spectrophotometer.

The response of the oxygen consumption to addition of salts is shown in Table 1 and Fig. 1. Figs. 2, 3 and 4 show the corresponding response of the enzymes.

IV. Addition of sulphate						
Cation.		K		Mg		
		126		123		

Table 1 shows that salts increase the respiration 20–30 per cent both in distilled water and in 1 per cent glucose, and that this stimulation is fairly unspecific, primarily with respect to different anions. The response to cations is comparatively unspecific, too, with the exception of magnesium and calcium, which are known to interfere with biochemical processes.

As shown by Figs. 1, 3 and 4, the sudden burst of respiration, starting 1–2 min. after the addition of salt (concentrations of 0·01 up to 0 2 *M* were tested), depends upon a corresponding increase in the activity of the enzyme system. Cytochrome *c* as well as diphosphopyridine nucleotide show a sudden increase of the velocity of reduction in nitrogen and re-oxidation in air (measured as the reciprocal of half-time). Similar observations were made regarding cytochromes a_3, *a* and *b*, of which a_3 responds very rapidly. The lag at starting, that is, the time elapsing from switching on nitrogen to the start of

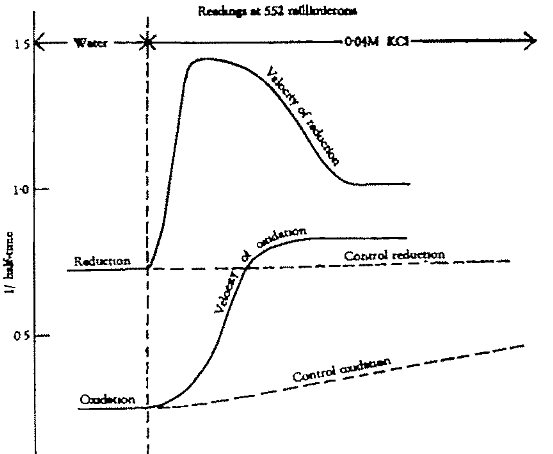

Fig. 3. Response of the velocities of reduction and re-oxidation to the addition of salt. Control and sample were both exposed to alternate gassing with nitrogen and air at constant intervals (see ref. 8) and the response at 552 mμ (cytochromes *c* + c_1) continuously recorded

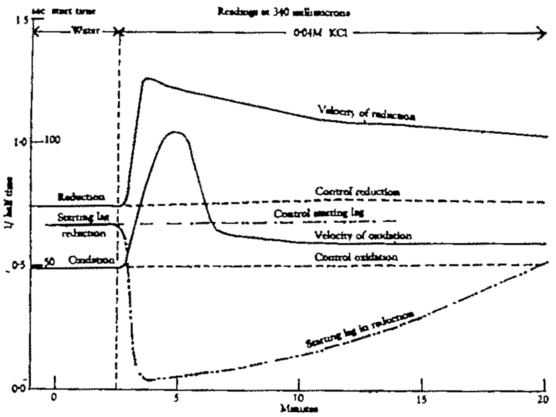

Fig. 4. Response of the velocities of reduction and re-oxidation and of the starting lag in reduction to an addition of salt. As in Fig. 3, but diphosphopyridine nucleotide at 340 mμ recorded

reduction (see ref. 8), drops considerably, too, a fact reflecting the rise in oxygen consumption; the dissolved oxygen disappears more rapidly if the cytochromes are activated.

It will be seen from Figs. 1, 3 and 4 that the sudden activation of the respiratory system attains an optimum a few minutes from the start and then slowly declines, even if the values still remain higher than in the controls. This fact may be explained as follows: the salt effect implies an acceleration of electrons through the respiratory system; this means a sudden over-consumption of substrate until a new balance between internal supply of substrate and oxygen consumption is attained.

Principle of Anion Respiration

The new experiments corroborate earlier results as to a non-specific salt (anion) effect[2-4]. This fact, as well as the observation that all enzymes in the respiratory chain are equally affected, is evidence against a closer combination between salt ions and enzymes. The new results are in full agreement with the principle of electrolytic regulation of the velocity of electron transference in the respiratory chain[2b]. It was originally assumed that electrons and anions are exchanged between single enzyme molecules (see below). This idea is still valid, but more recent results point to the existence of a spatially organized respiratory unit displaying electro-chemical properties similar to those of a galvanic cell.

Biochemical investigations are mostly confined to more or less purified and 'dissolved' enzymes, the reactions of which are proceeding in Newtonian media and obeying simple thermodynamic principles. It is, however, very unlikely that enzymes in the live protoplasm are behaving similarly to 'dissolved' enzymes. The regulated co-operation of numerous enzymes in the protoplasm points to the existence of a complicated spatial organization, in which the single enzymes occupy distinct areas. The activity of such enzymes will be guided by the spatial orientation of the molecules. It may be justified to speak of spatial biochemistry. The frequently used term 'multi-enzymes'[9] does not quite cover the conception of spatial organization, because important building stones of an enzyme system are 'factors' such as lipides, quinones, certain vitamins, etc. These factors serve as pathways or switchboards regulating the passage of electrons and intermediates between the reaction centres.

Little is known yet of reactions going on in organized enzyme systems, but it is possible to trace indirectly the existence of a spatial organization.

Observations of rhythmical pulsations in the stream of electrons through the respiratory system may be interpreted as a reflexion of its spatial organization[8,10]. Observations on homogenates of tissues point in the same direction. It was shown that even a high degree of mechanical disintegration of plant protoplasts does not change the quantitative relations between cytochromes a_3 and b. Spatially organized 'respiratory units' apparently compose the sub-micro-skeleton of the protoplasm, and it is reasonable to assume that these units are joined to microscopic structures, for example, surface layers of 'mitochondria'[12,4], the tonoplast of vacuolized cells, etc. We are now prepared to discuss the main problem, namely, the electrochemical properties of the respiratory unit.

According to recent observations[8,10], the respiratory system is composed of three spatially arranged groups of enzymes, namely: (1) enzymes linked with diphosphopyridine nucleotide; (2) flavoproteins and cytochrome b; and (3) cytochromes c and a_3. A number of accessory cytochromes (a, c_1, b_3, etc.) and 'factors' are additional elements of which some probably trap energy as high-energy phosphates. We know that diphosphopyridine receives electrons and protons from metabolites (*via* the tricarboxylic acid cycle) and transfers the electrons to the group flavoproteins + cytochrome b, which in its turn shuffles electrons to the group cytochromes $c + a_3$. From cytochrome a_3 the electrons leave the system with oxygen as the final acceptor.

The extremely rapid re-oxidation of a reduced respiratory unit indicates a location of the 'pole of oxidation' (o), namely cytochrome a_3, close to the surface of respiratory particles or membranes, whereas the 'pole of reduction' (i) namely, diphosphopyridine nucleotide, etc., is probably turned in a more or less opposite direction. As shown by Fig. 5, a stream of electrons moving from the pole of oxidation to the pole of reduction will then act as the internal circuit of a galvanic battery.

In the absence of an outer circuit, no electrons flow through a galvanic cell. A current starts, however, if the cell is surrounded by a salt solution, because the electrophoretic movement of ions in the outer circuit is a measure of the velocity of internal flux of electrons. The intensity of the current is regulated by the concentration (activity) of the salt ions.

This scheme may be applied to the conditions prevailing in the living cell. In the absence of salts, the stream of electrons from cytochrome a_3 to the dissolved oxygen molecules is slowed down to a minimum and the level of reduction of the respiratory enzymes rises. Because hydrogen ions and hydroxyl ions, together with anions of organic acids, are produced by the activity of the system itself, some 'respiratory idling' still proceeds; but observations on plant tissues and yeast show that lack of salts cuts down respiration to at least 50–75 per cent. Renewed supply of salts rapidly speeds up the stream of electrons. Because the capacity of dehydrogenation at the pole of reduction (Fig. 5) is less susceptible to changes, the immediate effect is a rising oxidation of the respiratory enzymes.

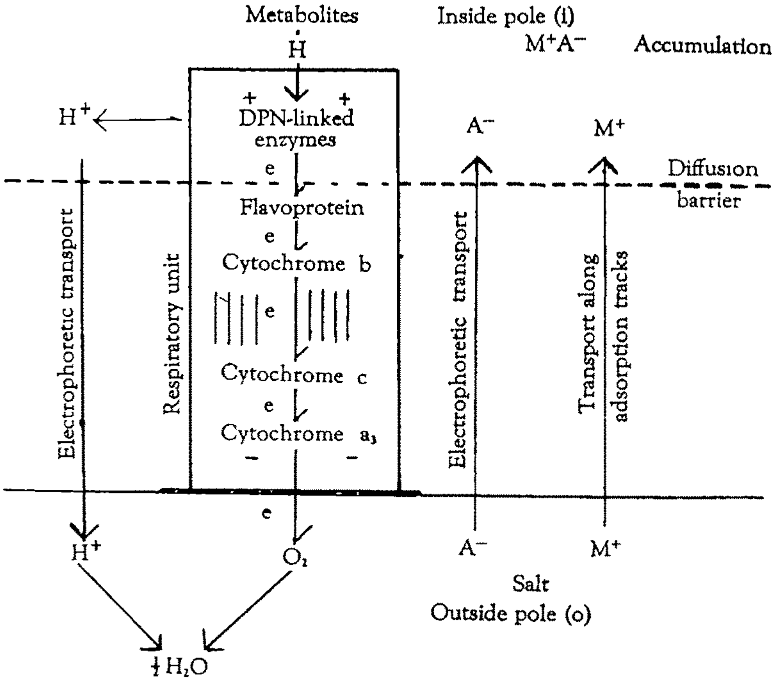

Fig. 5. Scheme of the principle of salt respiration. The respiratory unit is shown operating between surroundings containing free salts and an internal space behind a barrier which slows down the passive flow back of accumulated salts. The scheme may be applied to salt accumulation in the vacuoles of plant cells or in the interior of mitochondria. The initial salt absorption to carriers is omitted in this scheme (see text)

Biological Importance of Anion Respiration

The principle of anion respiration sheds light on a number of biological phenomena. It is a well-known fact that organisms produce electricity, even if only few of them, for example, the electric ray, store high-voltage static electricity. A circuit may be closed between the leaves and the roots of a plant and currents are also produced by root tips 1–2 cm. long[2b]. The respiratory character of the current is shown by the fact that the respiration rises or falls if the normal current is increased or diminished by means of an external supply of electricity. It may be expected that electric shocks directly affect the power of respiration, even if severe disturbances in the assembly of cations, which are adsorbed to cell structures, may be responsible for more 'explosive' effects.

Cytochrome respiration is a common condition for normal life and reproduction of cells, a thesis valid for almost all organisms—animals, plants and micro-organisms. A reflexion of the synthetic activity is the regulation of the amount of ion carriers referred to above. Malignant cells, for example, in cancer tumours, on the other hand, show a pronounced increase of glycolytic systems at the expense of cytochrome respiration[18]. Owing to stimulation of the cytochrome respiration, salts would perhaps help in curing tumours or mitigate deleterious effects of irradiation and/or to some extent protect normal cells from being affected by cancerogenous substances or irradiation. These are still unsolved problems. Deficiency in salts is a well-known cause of pronounced disturbances in the normal function of the animal organism.

Because transference of electrons occurs also outside of the scope of the 'respiratory unit' and because cytochromes may turn over electrons to acceptors other than oxygen, for example, in certain bacteria and in photosynthesis[15], salts may be able to display non-specific effects on many processes. An example of switching over glycolytic processes to a more efficient anaerobic utilization of glucose is given by wheat roots. In absence of oxygen, desalted roots show a 'glucose co-efficient' (consumed glucose/carbon dioxide produced) of 0·5. Addition of salt lowers the coefficient to values of about 0·33 or less.

The unspecific salt effect refers primarily to organized enzyme systems which are transferring electrons. It is, however, evident that a transference of electrons between two 'dissolved' compounds is also facilitated by salts. Salt anions will in this case probably be directly shuffled against electrons according to the scheme:

$$\text{reduced substance} + A^- \rightarrow (\text{oxidized substance}).A^- + e$$

provided that e is caught by an acceptor. Such a salt stimulation has been observed with regard to oxidation of cytochrome c (ref. 14).

According to Fig. 5 organized systems induce streaming of anions from the negative (o) to the positive (i) pole and of cations in the reversed direction. Because cations (H^+) are produced by the respiratory unit itself, but not anions, the regulating factor is primarily the supply of anions, hence the conception 'anion respiration'. If no semipermeable boundaries interfere, diffusion and mass streaming will perpetually counteract any appreciable accumulation of ions at the poles. The response of the respiratory units to salts will thus induce stirring in the surroundings and an indirect acceleration of the mixing of substances.

The synthesis of ion carriers is probably linked to the trapping of respiratory energy in products of phosphorylation[4], but very little is known about the chemical nature of these processes. The fact that cytochrome respiration maintains and reinforces the ability of the protoplasm to attract and retain salts is obviously of fundamental importance to the life of the cell.

The accumulation of free, that is, non-adsorbed, salts in the sap spaces of plant cells must be regarded as a special process implying the active transference of initially absorbed salts to the vacuoles. The retention of free salts is obviously caused by the operation of a barrier which precludes the rapid back flow of ions once accumulated. Fig. 5 illustrates the effect of a diffusion barrier placed between the poles of the respiratory unit. A monolayer of respiratory units will thus be able to accumulate anions. These anions will combine spontaneously with cations which are adsorbed to the protoplasm, as a consequence of which free salts are accumulated (see Fig. 5). It is feasible to assume that the vacuole membrance (tonoplast) acts in some such way. The fairly constant values of anion/oxygen observed in plant tissues point in this direction[3,4]. Accumulation of free salts would, of course, also occur in 'mitochondria' if the respiratory units are arranged in a monolayer coating the particles. Little is known, however, of true accumulation of salts in the 'free water' of protoplasts which do not contain vacuoles.

The investigations have been supported financially by the Swedish Research Councils of Natural Science and Agriculture.

NEWS and VIEWS

New Year Honours List

THE following names of scientists and others associated with scientific work appear in the New Year Honours list:

Baron: Sir George Nelson, chairman of the English Electric Co., Ltd.

Baronet: Sir James Paterson Ross, president of the Royal College of Surgeons of England.

K.C.M.G.: Sir Charles Blackburn, chancellor of the University of Sydney, for services to education and medicine; Dr. George A. Currie, vice-chancellor of the University of New Zealand; Sir Philip Morris, lately chairman of the Commonwealth Education Conference, vice-chancellor of the University of Bristol; Geoffrey W. Nye, adviser on agriculture to the Secretary of State for the Colonies

Knights: Prof. Edward Ford, director of the School of Public Health and Tropical Medicine, University of Sydney; Dr. William H. Glanville, director of the Road Research Laboratory (Department of Scientific and Industrial Research); Dr John Hammond, formerly reader in agricultural physiology in the University of Cambridge; William W. S. Johnston, of the State of Victoria, for his work for postgraduate education in medicine; Prof. Harrie S. W. Massey, Quain professor of physics, University College, London.

C.B.: M. I. Michaels, under-secretary, Office of the Minister for Science; R. N. Quirk, under-secretary, Office of the Minister for Science; R. H. Weir, director-general of engine research and development, Ministry of Aviation; Dr. H. F. Willis, chief of the Royal Naval Scientific Service.

C.M.G.: A. W. Knight, chief commissioner of the Hydro-Electric Commission, State of Tasmania; R. E. Stedman, under-secretary, Ministry of Agriculture, Fisheries and Food; C. W. Michie, permanent secretary, Ministry of Agriculture, Northern Region, Nigeria; S. E. Morris, secretary for native affairs and chief native commissioner, Southern Rhodesia; Dr. E. W. Russell, director of the East African Agriculture and Forestry Research Organization.

C.B.E.: Prof. S. Alstead, regius professor of materia medica and therapeutics, University of Glasgow; H. E. Bannister, assistant secretary, Ministry of Agriculture, Fisheries and Food; J. D. Clark, director of the Rhodes–Livingstone Museum, Northern Rhodesia; C. E. Clarke, principal actuary, Government Actuary's Department; Dr. T F Davey, senior specialist (leprologist), Eastern Region, Nigeria; L. J. Davies, director of research and education, British Thomson–Houston Co., Ltd.; J. Edwards, head of Production Division and scientific adviser, Milk Marketing Board; Dr. A. J. P. Martin, for services in the development of chromatographic analysis; Dr. D. C Martin, assistant secretary of the Royal Society; Dr. A. T. R. Mattick, lately deputy chief scientific officer, National Institute for Research in Dairying, Shinfield, Reading; T. B. Nicol, engineer-in-chief, Metropolitan Water, Sewerage and Drainage Board, New South Wales; H. T. Pledge, keeper in the Science Museum, South Kensington; W. T. Price, principal of Harper Adams Agricultural College, Newport, Shropshire; H. T. Ramsay, director of the Safety in Mines Research Establishment, Ministry of Power; J. B. Randall, director of Veterinary Services and Animal Industry, Uganda; F. I. G. Rawlins, deputy keeper and scientific adviser, National Gallery; G. B. Ryle, director of forestry for England, Forestry Commission; Prof. R. W. Scarff, professor of pathology, University of London; V. C. Williams, of Griffith, New South Wales, for services to irrigation research.

From January 1960, issues of *NATURE* will be grouped into four volumes a year, instead of two as heretofore

Royal Society Vice-Presidents

THE president of the Royal Society, Sir Cyril Hinshelwood, has appointed the following vice-presidents for the year ending November 30, 1960: Sir William Penney, treasurer of the Royal Society, member for scientific research, United Kingdom

Atomic Energy Authority; Sir Lindor Brown, biological secretary of the Royal Society, Jodrell professor of physiology at University College, London; Sir William Hodge, physical secretary of the Royal Society, Lowndean professor of astronomy and geometry in the University of Cambridge; Dr. H. G. Thornton, foreign secretary of the Royal Society, lately head of the Department of Soil Microbiology at Rothamsted Experimental Station; Sir Patrick Linstead, rector of the Imperial College of Science and Technology; and Prof. Wilson Smith, professor of bacteriology at University College Hospital Medical School in the University of London.

Biology at Middlesex Hospital Medical School:

Prof. J. H. Woodger

PROF. J. H. WOODGER has just retired from the Middlesex Hospital Medical School after thirty-seven years as head of the Department of Biology. He graduated at University College, London, in 1914 and returned as assistant in zoology after four years active service, mainly in Mesopotamia, before accepting an appointment in the Middlesex Hospital Medical School at the age of twenty-eight. At a very early stage in his career, Woodger discerned that much of what passed for 'zoological philosophy' was a hotch-potch of confused thinking based upon an inattentive or insufficiently analytical use of words. In his "Biological Principles" of 1929 he did his utmost to dissect some of the stock antitheses of biology—for example, the antithesis between preformation and epigenesis—with the resources of ordinary language; but ordinary language proved too clumsy and imprecise, and Woodger's thoughts accordingly turned to the logical symbolism of Russell and Whitehead's "Principia Mathematica", enriched by the addition of many empirical constants for ideas which (unlike number or similarity) cannot be defined by logical concepts alone. His "Axiomatic Method in Biology" of 1937 was the first attempt to 'axiomatize' biology, that is, to cast it in the form of theorems logically deducible from a small number of axioms or postulates. Woodger has an international reputation as a logician; his "Technique of Theory Construction" of 1939 is a splendid exposition of the modern ideas on scientific methodology that arose mainly from the work of Karl Popper. Woodger's fine analytical work was continued in his Tarner Lectures of 1949–50 and is still actively in progress. His attempts at axiomatization have been thought premature by some who are competent to express an opinion; but the attempt to import rigour and precision into biological thinking was very much overdue, and Woodger's writing and thinking have had a quiet but deep and pervasive influence over a great deal of modern biological thought. Woodger stands in the mainstream of the great tradition of British empiricism; and his work marks the final repudiation of the metaphysical elements in *Naturphilosophie.*

Prof. D. R. Newth

PROF. WOODGER'S successor, Dr. D. R. Newth, is also a graduate of University College, London; and, like Woodger, he spent four years on active service between graduating in zoology in 1942 and returning to postgraduate work in 1946. Prof. Newth is an embryologist and the son of an embryologist; but narrow sectarian classifications are no longer appropriate in biology, and he is best described as a biologist of unusually wide knowledge and sympathies whose main concern has been with the biological problems raised by embryogenesis. His first work was on the normal development of amphibian embryos. He then turned to the largely neglected problems raised by the evolutionary history of the neural crest, and undertook an experimental analysis of its behaviour and fate in lampreys. After an interlude in which he worked upon the reactions of hagfishes to light, he returned to morphogenetic problems. His was the first rigorous attempt to answer the question: Can an animal 'regenerate' a part which it never possessed? In certain circumstances, he found, it can do so: by interfering with the primary embryogenesis of structures which are capable of regeneration in later life, they may develop abnormally; but these abnormalities can be partially made good if the abnormal part is amputated and so caused to grow anew. His analysis provides one possible approach to the problem of the persistence of post-embryonic life of the available genetic information in somatic cells Newth's appointment will give particular pleasure not only to biologists in Great Britain but also to his many colleagues on the editorial board of the international *Journal of Embryology and Experimental Morphology,* in the foundation of which he was one of the prime movers.

Forest Products Research Laboratory

THE Council for Scientific and Industrial Research has reviewed the operation of the arrangements made early in 1958, under which it asked the Timber Development Association to assume responsibility for certain aspects of timber research previously discharged by the Forest Products Research Laboratory. The Steering Committee for the Laboratory had become convinced that the new arrangements did not allow sufficient latitude to the Laboratory in the discharge of its essential duties, and that the division of functions between the Laboratory and any other research organization must be more flexible. It was sure, therefore, of the need for a new approach to the problem of securing industrial support of work done for the immediate benefit of the timber trade (which was the aim of the earlier arrangements) and also to provide for the needs of the users—the home producer (including the Forestry Commission), the merchant and the manufacturer. At the same time it was regarded as essential to maintain an adequate and well-balanced research team at the Forest Products Research Laboratory. The Research Council has therefore re-stated its general policy for the Forest Products Research Laboratory in the following terms: "There is a continuing need in the national interest, both for research of a fundamental character on timber (but with ultimate practical applications) and for work of immediate benefit to the Forestry Commission and timber users. This work is best done at the Forest Products Research Laboratory with financial support from industry wherever possible. The Laboratory's programme should be co-ordinated with that of the Timber Development Association Research and Development Committee and/or of any Research Association which may be set up, but should primarily be devised to ensure that the interests of Government and the whole timber industry (producers and users, as well as merchants) are served to the best advantage".

Graphite Blocks for the Dounreay Reactor

The Morgan Crucible Co., Ltd., of Battersea, London, S.W.11, has now been permitted to reveal that for the first time special borated graphite blocks were used by the United Kingdom Atomic Energy Authority in the assembly of the shield which surrounds the reactor vessel at the Authority's experimental station at Dounreay. The blocks were made and machined by the Morgan Crucible Co., at its works at Norton, near Worcester. This factory is not engaged in the production of nuclear pure material and was therefore chosen as one suitable for handling large quantities of boron compounds. Most of the borated graphite contained 0·3 per cent boron, but some contained 5 per cent—in both cases very uniformly distributed throughout the graphite. The blocks themselves were machined to five hundred different patterns, some of which were so intricate that wooden dummies were made to ensure that it was practicable to machine them in graphite. As a final check, the layers of finished graphite blocks were assembled at Norton. The blocks, painted with distinguishing coloured bands to avoid any risk of confusion with nuclear pure material, were then packed into cartons for the journey. Transport to Dounreay was by heavy lorry, which made one round trip of 1,500 miles per week, taking the whole dry season of one year—some eight months in all.

World Meteorological Organization Conferences and Symposia, 1960

The World Meteorological Organization has issued a provisional schedule of conferences and symposia to be organized in 1960: *January*, Meeting on Atomic Transport and Removal of Radioactive Debris from Nuclear Tests (New York); *March*, Facsimile Broadcasts of the Working Group on Telecommunications, established by Regional Association VI (Offenbach–Frankfurt); *April*, Eastern Caribbean Committee of Regional Association IV of North and Central America (Curaçao); *June* 27–*July* 15, Executive Committee—twelfth session; *August*, Working Group on Telecommunications of the Commission for Synoptic Meteorology; *August* 16–*September* 3, Commission for Maritime Meteorology—third session (Utrecht); *September–October*, Regional Association VI, Europe—third session (Lisbon or Madrid); South American Regional Seminar on Tropical Agrometeorology (Venezuela); Working Group on the Guide to Climatological Practice established by the Commission for Climatology (Geneva); *November* 21–26, Working Group on Telecommunications—established by Regional Association I, Africa—fifth session (Cairo); *November* 28–*December* 16, Regional Association I, Africa—third session (Cairo); *December* 1–16, Commission for Climatology—third session (London).

Recent Geophysical Work in Great Britain

The meeting of the Geological Society of London on January 27 will take the form of a symposium on "Geological Implications of Recent Geophysical Work in the British Isles". The afternoon session will discuss "The Study of Igneous Rock Masses". The principal speakers will be Dr. M. H. P. Bott (University of Durham), who will speak on granites, crustal structure and isostasy, and Dr. D. J. Blundell (University of Birmingham), whose subject will be the use of rock magnetism in studies of igneous geology. Other contributors will be Prof. T. Murphy (School of Cosmic Physics, Dublin) and Mr. S. H. U. Bowie (chief geologist, Atomic Energy Division, Geological Survey). The evening session will consider "The Study of Sedimentary Basins". The principal speakers at this session will be Mr. N. G. O'Halloran and Mr. R. G. W. Brunstrom (British Petroleum Co.), on the use of seismic reflexion methods in geophysical surveying, and Dr. W. Bullerwell (Geological Survey), on aeromagnetic surveys over central, eastern and southern England. Prof. W. B. R. King and Mr. G. Armstrong (chief geologist, National Coal Board) will also speak. At the close of the evening session the discussions at both sessions will be summarized and reviewed by Prof. J. H. Taylor (King's College, London).

"Inadequacy of Scatter Mechanisms in Tropospheric Radio Propagation"

In a communication under this title in *Nature* of November 14, p. 1558, it was stated that "the lenses have an average size of a few kilometres diameter" Mr. P. C. M. de Belatini states that this should read "a few metres". The toroids themselves are believed to be on average about 600 metres in diameter with an 'eye' that acts as the lens of about 15 metres diameter. These dimensions, of course, vary with time.

Announcements

Mr. B. A. Worswick, recently chief engineer of Fischer and Porter, Ltd., has been appointed technical director with a seat on the Board of Elcontrol, Ltd. He was previously chief development engineer of Bailey Meters and Controls, Ltd., after having served for some years with Imperial Chemical Industries, Ltd.

The International Sericultural Commission has announced that the second International Technical Sericultural Conference will be held in Murcia, Spain, during April 2–5. Further information can be obtained from A. Schank, General Secretary-founder, Commission Séricicole Internationale, Station de Recherches Séricicoles, 28 Quai Boissier de Sauvages, Alès, France.

The Brighton Technical College School of Pharmacy has announced that a course of eight evening lectures on Spectroscopic Methods of Pharmaceutical Analysis will be held during the period February 9–March 29, at the Main Hall of the College, Richmond Terrace, Brighton 7. Further details can be obtained from Dr. J. C. Parkinson, School of Pharmacy, Technical College, Brighton 7.

A conference on the Actinomycins and their Importance in the Treatment of Tumours in Animals and Man will be held under the auspices of the New York Academy of Sciences at the Barbizon-Plaza Hotel in New York City during March 31–April 1. Further information can be obtained from the Executive Director, New York Academy of Sciences, 2 East 63rd Street, New York 21, N.Y.

Errata. In the communication entitled "A Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the Cristæ of the Elasmobranch *Raja clavata* in Terms of Directional Sensitivity" in *Nature* of December 5, p. 1807, Prof. O. Lowenstein points out that there are two mistakes: par. 3, line 1, for "when" read "why"; a grant acknowledged in the penultimate paragraph was from the Swedish Medical Research Council, not the Karolinska Institutet as printed.

CORNELL UNIVERSITY CENTER FOR RADIOPHYSICS AND SPACE RESEARCH

A NEW research centre is to be set up by Cornell University, Ithaca, New York, for the purpose of conducting research, and training research workers, in the subjects of radiophysics and space research. The centre will operate a high-powered radar equipment in Puerto Rico, financed by the Department of Defense. This equipment will make use of a fixed parabolic mirror with a diameter of 1,000 ft. built into a natural hollow in the mountains. It will have a peak power of 2·5 MW. In addition, it is proposed that there should be a radio-astronomy receiver near Ithaca, and a transmitter on the campus of Cornell.

The director of the new Centre will be Prof. T. Gold, who will be assisted by Prof. H. G. Booker as associate director. Both Gold and Booker went to the United States from Great Britain. Both worked on radar in England during the Second World War, Gold at the Admiralty Research Establishment, and Booker at the Telecommunications Research Establishment of the Ministry of Aircraft Production. After the War, Gold became a Fellow of Trinity College, Cambridge, and a demonstrator in the Cavendish Laboratory. Later he joined the Royal Observatory, Greenwich, as a chief assistant, and in 1957 he left for America, where he became professor of astronomy at Harvard. He is noted for the originality of his researches in astronomy, geophysics and the theory of hearing.

Booker took the Mathematical Tripos at Cambridge in 1933 and afterwards worked on the theory of electromagnetic waves in close collaboration with the radio section of the Cavendish Laboratory. He became a Fellow of Christ's College and a University lecturer in mathematics. During the War he led the theoretical division at the Telecommunications Research Establishment and was responsible for originating the 'duct' theory of super-refraction of radio waves. He returned to Cambridge after the War and played an important part in developing the theory of the scattering of radio waves from ionospheric irregularities. He left Cambridge for the United States in 1948, and became professor of electrical engineering at Cornell University. There he extended the theory of scattering to include the effect of irregularities in the troposphere, and he was one of the leaders in the team which turned this scattering to practical use in commercial 'forward scatter' radio links. He will retain his present position at Cornell in addition to becoming associate director of the new Center.

Both Booker and Gold are noted as mathematicians who can not only talk the language of the physicists but appear also to think in that language. They seem to have an intuitive grasp of fundamental principles which enables them to see at once what a piece of mathematics really implies. Together with the physicists, engineers and mathematicians at Cornell, all of whom will be called upon to help them from time to time, they will form a powerful team.

In one set of investigations the high-power radar equipment will be used to observe radio-echoes from the planets. In another it will be used for the observations of incoherent back-scatter from the electrons in the terrestrial ionosphere. Its use for the latter purpose will follow a suggestion by Gordon, which has already been tried out successfully by Bowles, that incoherent scattering might be used to investigate the upper side of the ionosphere. Gordon is to be a member of the Cornell team at the new Centre.

All radio- and space-physicists will look forward to valuable results from the new Center.

J. A. RATCLIFFE

RESEARCH BY McGILL UNIVERSITY IN BARBADOS

Bellairs Research Institute

THE Bellairs Research Institute of McGill University was founded in 1954 by the late Commander C. W. Bellairs, R.N., for the purpose of providing the University with research facilities in tropical biology. The first laboratory was put into operation in the seaside residence of Commander Bellairs in 1955. An increasing interest in the Caribbean area on the part of McGill soon made it apparent that the original quarters were not adequate for an expanding research programme. Plans were drawn up for a new building which was completed early in 1959.

While the present Institute quarters were designed primarily for the pursuit of studies in marine biology, the needs of workers in other fields of biology have not been overlooked in the construction of the building. The laboratory consists of three bright and airy work rooms with water tables and running fresh water and sea-water. There are a large concrete aquarium and outdoor tubs for the storage of freshly caught material. There are also an office, store-rooms, photographic room and microscope room. Outlets for bottled gas have been installed and the electric supply is 110 volts, 50 cycles. Accommodation, consisting of single and double bedrooms, lounge and kitchen, is available for a limited number of visiting investigators.

There are several small boats with outboard motors for collecting in shallow water and a 30-ft. diesel launch for work at sea. The launch is equipped with a winch and gear for oceanographic and plankton collections. Diving equipment, including aqualungs, an underwater camera and a variety of nets, dredges and other collecting gear, is available.

The Institute is situated on the western coast of Barbados, some seven miles from the capital, Bridgetown. A well-developed coral reef lies directly in front of the laboratory and extensive reefs lie along most of the western side. Around the rest of the island there is a wide variety of marine environments, including rocky shores and shallow-water flats of sand, mud or grass. Along the southern coast there are extensive shallow banks of corals and gorgonids, and many deep-water forms such as crinoids and antipatharians are found in 30–40 ft. of water. Deep oceanic water comes to within a mile or two of shore and the island lies close to the convergence of the North and South Equatorial currents.

Tropical Research Laboratory

Operating now in its second year is the McGill University Tropical Research Laboratory, located at Waterford, Barbados. The laboratory, which is administered through the departments of Geography and Meteorology of McGill University, has undertaken, in its initial stage, investigations into climatology and agricultural meteorology in the Caribbean and plans later to expand into a meteorological station as well as a graduate centre in the tropics for geographical research.

Among its immediate activities is the measurement of potential and latent evaporation at a tropical station. These results, with the usual meteorological data, will be published at regular intervals each year for the information of interested research workers in the field of climatology. Results of these investigations will also be used locally in experiments planned to aid the Department of Agriculture in the expansion of irrigation and land-use schemes.

PEST INFESTATION RESEARCH, 1958

THE report of the Pest Infestation Research Board of the Department of Scientific and Industrial Research for 1958* reflects the increased concern with problems of food storage and handling in overseas territories and on board ships, and with the problems that may arise when grain is stored for very long periods under different conditions of temperature and of oxygen concentration. Two long-term experiments have been set going, in which the effect of low temperature (4·5 ± 0·5 °C.) and low oxygen concentration (between 1 and 2 per cent), singly or in combination, on the keeping quality of dry wheat, will be investigated. A hard Canadian and a soft English wheat are being used. Chemical analyses, milling tests and bread-making tests were made initially and will be repeated at intervals over a period of ten or twelve years. Since it is quite inexpensive to maintain large stores of grain in these conditions the outcome of this investigation will be of considerable practical importance.

Films of insecticidal lacquers containing dieldrin and endrin have proved very effective in killing adult flour beetles (*Tribolium confusum*). It has now been shown that flour up to at least 2 in. deep becomes toxic to the beetles after being in contact with the lacquer for two weeks and retains this toxicity for many months. Until the amount of contamination that might occur in practice has been established, caution in the use of these particular insecticidal preparations is advocated. Whereas much is known about the susceptibility to insecticides of the insects of stored products, very little is known about the mites. An investigation of the flour mite (*Acarus siro*) is now being undertaken to make good this deficiency.

The use of gas-proof sheets for covering produce during fumigation has been increasing greatly in recent years. But users have been unable to obtain guidance on the selection of the material best suited to this purpose. Some have proved unsuitable because of lack of durability of the coating, others are highly permeable to methyl bromide and yet others become stiff after contact with liquid methyl bromide. A systematic study has now been carried out in co-operation with manufacturers, and the Laboratory should soon be in a position to put forward agreed specifications.

In addition to these problems of immediate practical importance the Laboratory has continued to produce a large amount of basic information on the insects and other organisms affecting stored products. This has consisted in detailed life-history studies in controlled physical environments, the systematics of insect pests, the response of insects to fumigants and other insecticides. In the Biochemistry Section work of even wider interest has been carried out. The physiological and toxicological studies on the mode of action of insecticides and the biochemical nature of acquired resistance to insecticides being carried out in that section is fundamental to applied entomology of every kind.

X-RAY MEASUREMENT OF THERMAL EXPANSION PERPENDICULAR TO THE LAYER PLANES OF ARTIFICIAL AND NATURAL GRAPHITES

By E. G. STEWARD and B. P. COOK
Research Laboratories, The General Electric Co., Ltd., Wembley

THERE are apparently conflicting data in the literature concerning X-ray diffraction measurements of (*a*) the thermal expansion of graphitic carbons and (*b*) the possible variation of the expansion coefficient with the proportion (p) of disordered (turbostratic) stacking of the layer planes.

For natural (Ceylon) graphite (p almost zero) over the range 15–800° C., the variation of the interlayer spacing d (A.) with temperature t (deg. C.) is given by Nelson and Riley[1] as $d = 3 \cdot 3525 + 90 \cdot 54 \times 10^{-6}\, t + 6 \cdot 33 \times 10^{-9}\, t^2$ (giving an average expansion coefficient (α) defined as $\frac{d_2 - d_1}{d_1 \Delta t}$, of 28·5 ± 0·1° C.$^{-1}$) and by Matuyama[2] as $d = 3 \cdot 3535 + 82 \cdot 41 \times 10^{-6}\, t + 10 \cdot 30 \times 10^{-9}\, t^2$ ($\alpha = 27 \cdot 0 \pm c.\ 0 \cdot 1°$ C.$^{-1}$) (Fig. 1). If in either determination the experimental errors have been so under-estimated that the difference in the resulting values of the average expansion coefficient is not in fact significant, then the inclusion in the appropriate

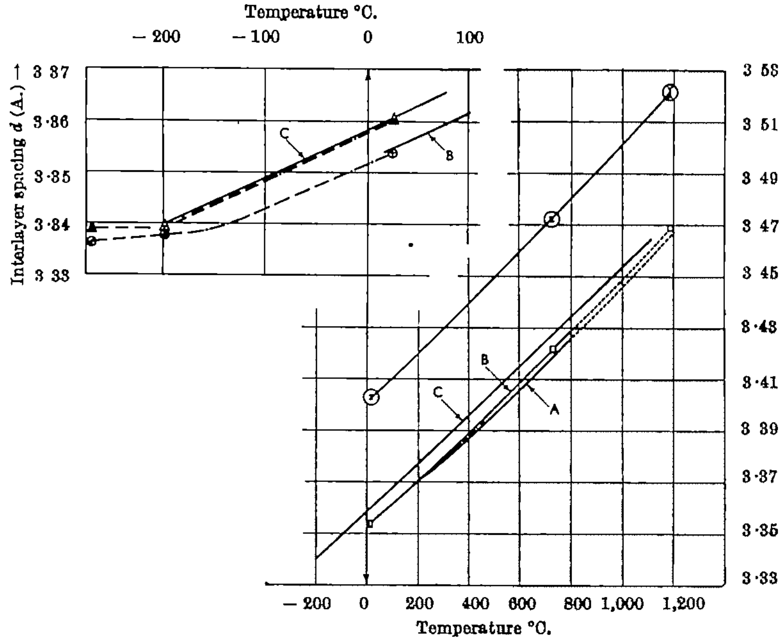

Fig. 1. Interlayer spacings of graphitic carbons as a function of temperature. *A*, $p \simeq 0$ (Matuyama); *B*, $p \simeq 0$ (Nelson and Riley); *C*, $p \simeq 0{\cdot}2$ (Walker, McKinstry and Wright); ⊕, $p \simeq 0$ (Baskin and Meyer); ▲, $p \simeq 0{\cdot}2$ (Baskin and Meyer); – – –, extrapolations to 1,200° C. from given equations; □, denotes present results and error limits for $p \simeq 0$; I, denotes present results and error limits for $p \simeq 0{\cdot}75$; – · – · –, see text

equation of the small term in t^3 would not be justifiable.

For an artificial graphite with about 20 per cent disordered stacking ($p \simeq 0{\cdot}2$) over the range –196–1,118° C., Walker, McKinstry and Wright[3] obtain $d = 3{\cdot}358 + 95{\cdot}2 \times 10^{-6}\, t$ (Fig. 1) with a standard deviation from linearity significantly smaller than the above βt^3 terms at high temperature. From their results Walker *et al.* calculate a decrease of 13 per cent in interlayer binding-energy between room temperature and 1,118° C. From a comparison of their results with those of Nelson *et al.* for the more perfect graphite, they conclude that the increase in d for a given rise in temperature is independent of p. By using the known[4] relationship between d and p one could then deduce that the expansion is independent of d—as found experimentally by Walker for their own artificial graphite.

Some recent qualitative work by Matuyama[5] on a range of essentially non-graphitic carbons is inconclusive on the issues under discussion.

Baskin and Meyer[6] report considerable differences in the amounts of crystal structure contraction of artificial ($p \simeq 0{\cdot}2$) and natural ($p \simeq 0$) graphite on cooling from room temperature to 4·2° K. (Fig. 1). Their 'average' expansion coefficient (based on two points 78° K. and 297° K.) for the artificial graphite agrees well with Walker's value but for natural graphite is lower than Nelson and Riley's value over 15–800° C. They suggest that the smaller changes they observe in cooling from 78° K. to 4·2° K. result from anisotropic contraction of crystallites producing mutually restraining stresses; these would be greater for artificial graphites having smaller crystals than for natural graphite.

To minimize dependence on absolute accuracy in making comparisons between different types of graphite, we have made measurements in the same apparatus under the same conditions, on both a natural graphite ($p \simeq 0$) and on a coke. To enhance any differences dependent on crystal structure stacking disorder, a coke with a large proportion ($p \simeq 0{\cdot}75$) of turbostratic structure was chosen. Results for room temperature, 728° C. and 1,188° C. (actual values (± 6° C.) determined by platinum lattice expansion calibration), are shown in Fig. 1. For the natural graphite where all reflexions arise from ordered structure, $000l$ and $11\bar{2}l$ reflexions were used and correction was made in the conventional way for absorption, etc. For the less graphitic material, although full correction to put the results on an accurate absolute scale was not possible, relative changes in 0004 reflexion angles were measured with sufficient precision for this initial survey. Thus, while the gradient for $p \simeq 0{\cdot}75$ has an accuracy limited only by the relative errors (indicated in Fig. 1) for the individual points, the numerical values for any temperature probably have a slightly greater error (± 0·005 A.). In the range 15–728° C. for $p \simeq 0$, $\alpha = 28{\cdot}4 \pm 0{\cdot}7°\ \text{C.}^{-1}$ and for $p \simeq 0{\cdot}75$, $\alpha = 29{\cdot}2 \pm 0{\cdot}7°\ \text{C.}^{-1}$.

Several significant features may be noted from the present results and survey.

The new measurements on the natural graphite closely follow the earlier findings of Nelson and Riley and give an indication at 1,188° C. of slight departure from linearity. For our less-graphitic material ($p \simeq 0{\cdot}75$) there is again approximate linearity and the expansion coefficient over the range 15–1,188° C. is the same within present limits of accuracy as that for the fully graphitic carbon. Thus in the range of interlayer spacings involved and over this temperature-range the coefficient of expansion perpendicular to the layer planes appears to be largely independent of d and p. The evidence of some curvature for the most perfect graphites supports the view that the coefficient of expansion must, however, be a function of temperature: further investigation at higher temperatures is clearly desirable.

For fully ordered graphite at 78° K. and 4·2° K., rather than deduce with Baskin and Meyer that the expansion coefficient is "distinctly lower", it is suggested that the variation of d with t is following the course shown thus –·–·– in Fig. 1; at these lower temperatures contraction is eventually limited by the repulsion forces between adjacent layer planes. Supporting this view is the observation that for the artificial graphite with $p \simeq 0{\cdot}2$ and correspondingly larger d, Walker's results show uninterrupted and essentially linear contraction from higher temperatures down to 78° K. At the lowest temperatures, where for either material the interlayer spacing is becoming critical, thermal contraction becomes smaller. Presence of imperfections in the structure also becomes important, and this may well explain the different ultimate behaviour reported by Baskin and Meyer between their materials: in particular, it would be expected that turbostratic stacking would have a larger limiting *d*, since the random atomic arrangement between adjacent layers will hinder their close approach.

It is hoped to report and discuss these results in more detail elsewhere and when further investigations at high and low temperature have been made.

PLANT THIOGLYCOSIDES AND THE PROBLEM OF ENDEMIC GOITRE IN AUSTRALIA

By H. S. BACHELARD and PROF. V. M. TRIKOJUS
Department of Biochemistry, University of Melbourne

CLEMENTS and Wishart[1] have suggested that an appreciable amount of endemic goitre in certain areas of Tasmania may be due to a goitrogen present in the milk of cows fed 'chou moellier'. Apart from other evidence, milk and extracts of skim milk from chou moellier-fed cows were found to depress the uptake of iodine-131 by the thyroid glands of experimental animals and human volunteers. Samples of milk from the goitrous area of Warwick (Queensland), where in spring and early summer the pastures are heavily contaminated with turnip weed (*Rapistrum rugosum*), were also shown to be goitrogenic[2]. By implication, other cruciferous weeds might be considered suspect in relationship to the general hypothesis of an association between plant thioglycosides and endemic goitre in certain circumstances.

Greene, Farran and Glascock[3], in comparing milk from cows fed hay, chou moellier or pastures lightly contaminated with cruciferous weeds, found the latter to have the highest goitrogenic activity. Factors complicating the comparison of the results of investigators in different parts of the world could be alterations in the content of thioglycosides in the plant due to differences in variety, soil and climatic conditions, or modifications of the rumen flora. On the other hand, Virtanen, Kreula and Kiesvaara[4] examined the milk of a cow 12 hr. after it had been fed moistened rape seeds (equivalent to 4·5 gm. (–)-5-vinyl-2-oxazolidinethione (goitrin[5])) and could detect only a small amount of a substance showing a similar spectral absorption curve to goitrin but with an absorption maximum at 255 mμ instead of 240 mμ.

In association with the Goitre Sub-Committee of the National Health and Medical Research Council, we have been engaged on a systematic investigation of the thioglycosides—and their aglycones—of chou moellier and of those cruciferous weeds which are prevalent as contaminants of pastures in goitrous areas of Tasmania and southern Queensland. We wish to report here some of the results which we have obtained in a study of *Rapistrum rugosum*.

The seeds of this plant yielded unexpectedly only traces of thioglycosides, whereas chromatographic examination of extracts of the mature fruit, including seeds, revealed the presence of one major and one minor component. From such extracts, after treatment with myrosin, we were able to separate the major aglycone in crystalline form (m.p. 45° C.; 1·2 gm. per kgm. dry weight) and to establish its identity as γ-methylsulphonyl-propyl-*iso*thiocyanate, a substance previously isolated from wallflower seeds (*Cheiranthus cheiri*) by Schneider[6] and named by him 'cheiroline'. Schneider was able to confirm the structure of cheiroline by synthesis (see also Kjaer, Marcus and Conti[7]. We are indebted to Prof. Kjaer for an authentic sample of cheiroline).

Cheiroline was also isolated from the tissues of *Rapistrum rugosum*—in the case of extracts of fresh leaves, 0·4 gm. crystalline aglycone per kgm. wet weight. The yields of pure aglycone from fruit and leaves, which must be regarded as minimum values, would indicate a potentially high daily intake by a cow grazing on heavily contaminated pastures.

The results of experiments to compare the action of cheiroline with that of known goitrogens are summarized in Table 1.

Table 1. COMPARISON OF EFFECTS OF CHEIROLINE, THIOURACIL AND GOITRIN ON IODINE-131 UPTAKE (1 μC.) BY THE THYROIDS OF 100 GM. MALE RATS

Expt. No.	Mean net counts per min.				Per cent control group		
	Control	Cheiroline	Thiouracil	Goitrin	Cheiroline	Thiouracil	Goitrin
1*	23,710	3,700	2,178	—	16	10	—
2*	14,893	4,339	1,710	—	29	11	—
3†	10,313	5,474	—	885	55	—	9
4†	13,369	5,071	—	1,170	40	—	9·5

Dosage: cheiroline, 5 mgm.; goitrin, 5 mgm.; thiouracil, 1 mgm.; each in 1 ml. saline. Control, 1 ml. saline. Four animals per group.
* Mixed strain, Wistar and *Rattus norvegicus*.
† Wistar strain.

The substances were injected subcutaneously 1 hr. prior to the intraperitoneal injection of iodine-131, the animals killed 3 hr. later and the thyroids dissected, weighed and digested overnight and then counted in a scintillation counter (compare ref. 8). On the basis of this test, cheiroline is goitrogenic, although the degree of response varied, with the differences most marked between the two strains of animals used. It was considered unlikely that variation in iodine intake was a factor, as the dietary pattern in our colony (Wistar strain) was very similar to that of the mixed strain obtained from another source in Melbourne, but that possibly the *iso*thiocyanate group had been modified *in vivo*, thereby introducing another variable. By contrast, the activities of goitrin and thiouracil, although measured in different strains, had approximately the same ratio (1 : 6) as that recorded by Astwood, Greer and Ettlinger[5]. According to Kjaer[9], *iso*thiocyanates are inactive or only weakly active as goitrogenic agents (see also Wagner-Jauregg and Koch[10]).

Since we have a prime interest in the behaviour, in the rumen, of cheiroline (and other thioglycoside aglycones), we examined its stability in this medium. Cheiroline was incubated with freshly taken rumen liquor, after filtration through butter muslin, as set out in Table 2.

Table 2. INCUBATION OF CHEIROLINE WITH RUMEN LIQUOR

* *p*H 6·4.
† Initial *p*H assumed in all cases as for blank (6·35).
‡ As volatilized from NaOH-treated samples.

Urea was added to produce levels of ammonium ion comparable to those attained in animals grazing during the flush spring growth. At the conclusion of the incubation period, the contents of the bottles were brought to 85° C., centrifuged, and the supernatants dried in the frozen state. When samples of chloroform extracts of the residues were applied to paper and run in chloroform/water and then sprayed with Grote's reagent[11] or ammoniacal silver nitrate solution, the control chromatograms were negative, whereas, on those corresponding to the flasks to which cheiroline had been added, this substance was absent, but there was a strong spot at R_F 0·12, with a minor spot which ran at the same R_F as cheiroline monothiourea (close to the origin). There was no difference between the chromatograms corresponding to the 2- and 5-hr. incubation periods. The combined chloroform extracts were passed twice through an alumina column with 80 per cent ethanol used each time to elute a slightly coloured upper band. The oily residue from the second eluate was washed several times with small amounts of ether and chloroform, and it was then obtained crystalline from methanol (yield about 12 mgm.). The substance slowly developed a permanent bluish green colour in dilute acetic acid with the addition of potassium ferrocyanide[12], as did also cheiroline monothiourea but not cheiroline itself. It was recrystallized from methanol (m.p. 117–119° C.), analysed (found: S = 30·5 per cent) and identified as *sym.* di-cheiroline thiourea ($(CH_3SO_2CH_2CH_2CH_2NH)_2C{=}S$), when compared with a synthetic sample, on the basis of R_F values—in chloroform/water (Fig. 1) and *n*-butanol/ethanol/water, 4 : 1 : 4—analysis (calc.: S = 30·3 per cent) and mixed melting point (which was undepressed). This compound separated rapidly in high yield when equimolecular proportions of cheiroline and γ-methylsulphonyl-propylamine hydrochloride were mixed in ethanolic solution in the presence of triethylamine. The synthetic material was recrystallized from methanol (m.p. 121–122° C.; Schneider[6] reported 125–126° C. (from water)).

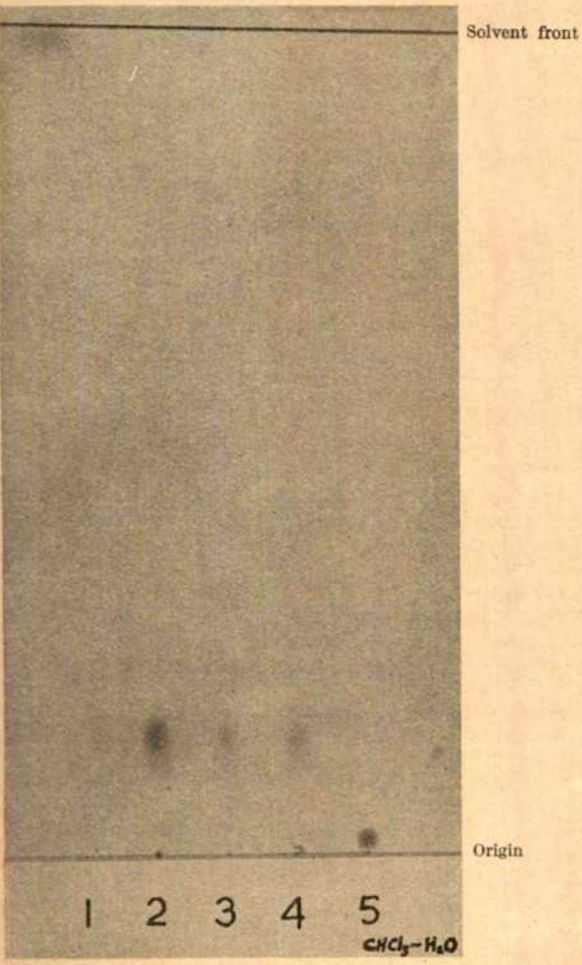

Fig. 1. (1) Cheiroline; (2) crude chloroform extract; (3) synthetic di-cheiroline thiourea; (4) crystalline substance from chloroform extract; (5) cheiroline monothiourea. Cheiroline running with solvent front. Chromatogram sprayed with ammoniacal silver nitrate

A few disubstituted thioureas have been shown to be goitrogenic in the rat[13,14] and, in the case of dibenzylthiourea, in the rabbit[15] (by mouth but not when injected). Diethyl thiourea by mouth was found by Astwood[13] to be a more active goitrogen in the rat than thiourea. Ethyl *iso*thiocyanate is one of the numerous aglycones of this type recorded as occurring in Nature[16,17], very few of which possess a hydroxyl group in the appropriate position for spontaneous cyclization to derivatives of 2-oxazolidinethione related to goitrin. It may be noted that, although we have isolated crystalline goitrin from chou moellier seeds in amount equivalent to 2 gm. per kgm., this substance corresponds to but one of four major thioglycoside fractions present in the seed extracts.

In preliminary tests using the above-mentioned rat assay method, di-cheiroline thiourea proved to be only weakly goitrogenic (iodine-131 uptake 70 per cent of the control (dose 5 mgm.) compared with cheiroline 30 per cent (5 mgm.) and thiouracil 12 per cent (1 mgm.)). The results following other routes of administration may well be different, since the thiourea, when pure, is practically insoluble in ether and chloroform, sparingly so in methanol and appreciably soluble in water, properties which are largely the reverse of those shown by cheiroline. There are, moreover, several cases where the rat assay has been shown to be an unreliable index of goitrogenic potency in man, for example, of 1-methyl-2-mercaptoimidazole[18].

We are at present more interested in the questions as to whether the transformation of *iso*thiocyanates in rumen liquor is a general reaction, whether it occurs in the rumen *in vivo*, and, if so, whether the products can be absorbed and transferred to milk.

There are thus certain obvious extensions of the experiments reported here—and several of these are in progress—before a general concept of the transformation in the rumen of *iso*thiocyanates into goitrogenic disubstituted thioureas can be added to the hypothesis stated at the beginning of this article.

We are indebted to Dr. F. W. Clements for organizing the supply of suspected plants and their seeds; to Dr. M. T. McQuillan for her co-operation in the rat assays; to Dr. F. J. R. Hird for the ammonia values; and to the National Health and Medical Research Council for a personal grant (H. S. B.) and financial assistance towards the costs of the investigation.

OCCURRENCE OF AN ORGAN-SPECIFIC ANTIGEN ASSOCIATED WITH THE MICROSOME FRACTION OF PLANT CELLS AND ITS POSSIBLE SIGNIFICANCE IN THE PROCESS OF CELLULAR DIFFERENTIATION

By Dr. S. T. C. WRIGHT*

Department of Experimental Pathology, Medical School, University of Birmingham

THE microsome particles of cells have received considerable attention from biologists because they are widely believed to play a major part in protein synthesis. However, little has been done to determine their role in cellular differentiation, although several workers have postulated their probable importance in this fundamental process (most recently by Bonner[1]). New light has been thrown on this aspect of microsome physiology while employing the Ouchterlony serum–agar technique[2] to study the changes which occur in the antigens of the wheat coleoptile during growth and differentiation and the distribution of these antigens in the other organs of the wheat plant (*Triticum vulgare*).

The wheat coleoptile during growth undergoes a period of cell division followed by one of differentiation. Cell counts using the method of Brown and Rickless[3] established that cell division was completed when the coleoptile had been growing for 54 hr. after sowing at 25° C. (var. King II) and thereafter, until 96 hr., growth was associated with cellular differentiation which in the coleoptile is largely a process of cell elongation.

Using an adjuvant technique[4], an antiserum was raised in a rabbit against a phosphate buffered protein extract (M/50; *p*H 7·6) of three thousand coleoptiles, containing samples of both early and late phases of growth and differentiation. A phosphate-buffered agar plate was set up as shown in Fig. 1 with this antiserum added to the centre cup. Approximately 1 per cent protein extracts of coleoptiles of different ages from 18 to 96 hr. were pipetted in the outer ring of cups. The antigen mixtures and antibodies were allowed to diffuse towards each other in an incubator at 37° C. for 20 hr. Precipitin bands formed, and where they joined one another it was assumed that they corresponded to the same antigen.

From a study of the frequency and distribution of mitotic figures in histological sections, together with information obtained from the change in cell number during growth, it was estimated that at 18 hr. and 24 hr. after sowing about 85 per cent of the cells of the coleoptile were either potentially able to divide or were dividing, the remainder being mainly in the early stages of differentiation. At 30 hr. about 70 per cent were dividing or potentially able to divide, at 42 hr. 30 per cent, and at 72 hr. 0 per cent, when all were differentiating or had differentiated. In the extracts representing the high percentage of dividing or pre-dividing cells three precipitin bands predominated (Fig. 1), and as the proportion of differentiating cells increased so other bands assumed dominance. Thus it appears that as differentiation proceeds the

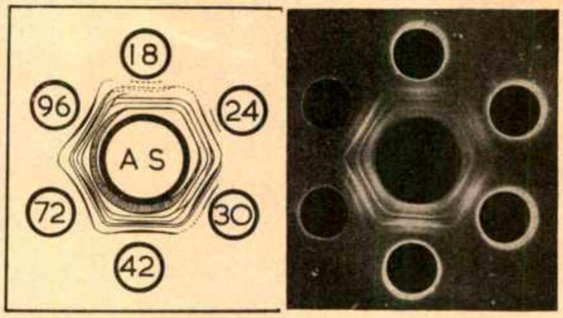

Fig. 1. Serological analyses of protein extracts representing different stages in the growth and differentiation of the wheat coleoptile. The figures in the outer ring of cups refer to the age of the coleoptile in hours from which the particular protein extract was made. The centre cup contained coleoptile antiserum possessing antibodies to all stages

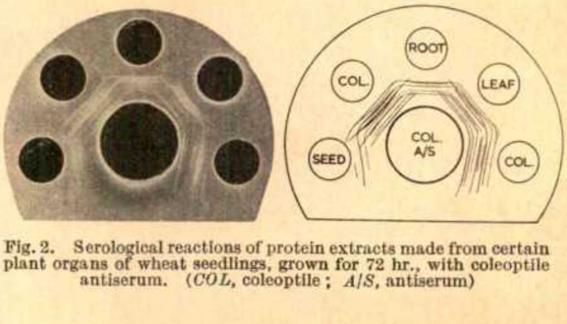

Fig. 2. Serological reactions of protein extracts made from certain plant organs of wheat seedlings, grown for 72 hr., with coleoptile antiserum. (*COL*, coleoptile; *A/S*, antiserum)

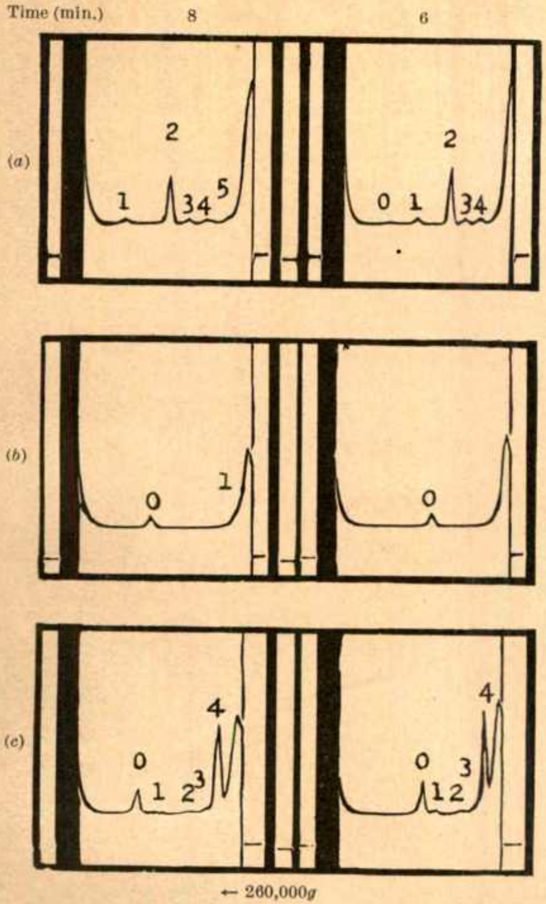

Fig. 3. Sedimentation diagrams of coleoptile, root and leaf extracts of wheat seedlings in 0·25 *M* sucrose, *M*/100 phosphate buffer *p*H 6·8. *a*, Dark-grown coleoptiles (48 hr. after sowing) ($S_{20,w} \times 10^{-13}$ values: peak 1 = 105; peak 2 = 69; peak 3 = 50; peak 4 = 33; peak 5 = 20). *b*, Roots (3 days after sowing) ($S_{20,w} \times 10^{-13}$ value: peak 0 = 73). *c*, Light-grown leaves (7 days after sowing) ($S_{20,w} \times 10^{-13}$ values: peak 0 = 74; peak 4 = 18)

principal differences in the cellular antigens are quantitative rather than qualitative. Nevertheless, it must be borne in mind that there could be qualitative antigenic differences existing between dividing and differentiating cells which were not apparent in these experiments because of the presence of a small proportion of differentiating cells in the extracts representing dividing cells.

To study the distribution of the coleoptile antigens throughout the plant, three-day-old wheat seedlings were dissected into coleoptiles, leaves, roots and seeds. These were extracted in phosphate buffer (*M*/20, *p*H 7·6) and, after centrifugation at 1,200*g* for 10 min., the extracts were pipetted into cups cut in a phosphate-buffered agar plate as shown in Fig. 2. The coleoptile antiserum was placed in the centre cup and the plate was incubated as described above. The coleoptile shared many of its precipitin lines with the leaf extract, as would be expected, since the coleoptile is in the nature of a modified leaf. The root and seed shared only a few precipitin lines with the coleoptile, although, doubtless, they possess their own specific antigens which were not detected with this antiserum.

Concurrently with these investigations an analytical ultracentrifugal study was carried out on coleoptile, leaf and root extracts. These extracts were made in phosphate-buffered (*M*/100; *p*H 6·8) 0·25 *M* sucrose and the results of the runs in the analytical ultracentrifuge are shown in Fig 3, *a*, *b* and *c*. All the extracts were found to contain a heavy component with a sedimentation constant within the range 69–74*S* (coleoptile = 69*S*; leaf = 74*S*; and root = 73*S*). Ts'o, Bonner and Vinograd[5] have reported that extracts of pea seedlings, after removal of the very large particles, contain a major component of 74*S*, which on analysis was found to contain 30–37 per cent ribonucleic acid, 55 per cent protein and 4·5 per cent phospholipids. They concluded that in size, chemical composition and morphology the particles resemble the nucleoproteins of the microsomes from animal tissues. Moreover, the 74*S* particle was found to dissociate at a *p*H of 8·5 into two particles of 58*S* and 38*S*, thereby forming a polymeric series[6]. Extracts were therefore made of coleoptiles (48 hr. after sowing) in 0·25 *M* sucrose at *p*H 6·8 and 8·4 (*M*/100 phosphate buffer) and it was found that the 69*S* component similarly dissociated at the higher *p*H and that the resulting $S_{20,w} \times 10^{-13}$ values of 69,50 and 33 corresponded to a polymeric series related as trimer, dimer and monomer, respectively (Fig. 4).

In order to determine whether any of the precipitin lines were associated with a 'microsome' antigen, the heavy components (mitochondria, nuclei, etc.) were first removed by a preliminary centrifugation at 10,000*g* for 30 min. from a 0·25*M* sucrose *M*/100 phosphate buffer *p*H 6·8 extract of coleoptiles grown for 48 hr. After 3 hr. dialysis against the extracting solvent, using narrow gauge dialysis tubing, the supernatant was transferred to an analytical ultracentrifuge cell and centrifuged at 260,000*g* until the 33*S* component had sedimented to the bottom of the cell. In order to clarify the serological pattern the supernatant (which should be free of the heavy components) was used to absorb out of the antiserum the antibodies specific to the relatively low molecular weight antigens, thereby producing, provided the absorption has been taken to completeness, an antiserum specific to any 'microsome' antigens. The microsome pellet was suspended in phosphate buffer

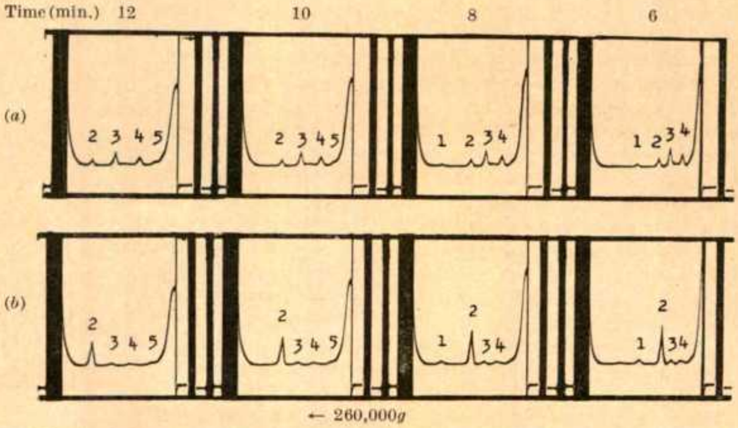

Fig. 4. Sedimentation diagrams illustrating the dissociation of the 69*S* component with *p*H change. Coleoptiles extracted in 0·25 *M* sucrose, *M*/100 phosphate buffer. *a*, *p*H 8·4; *b*, *p*H 6·8 ($S_{20,w} \times 10^{-13}$ values: peak 2 = 69; peak 3 = 50; peak 4 = 33)

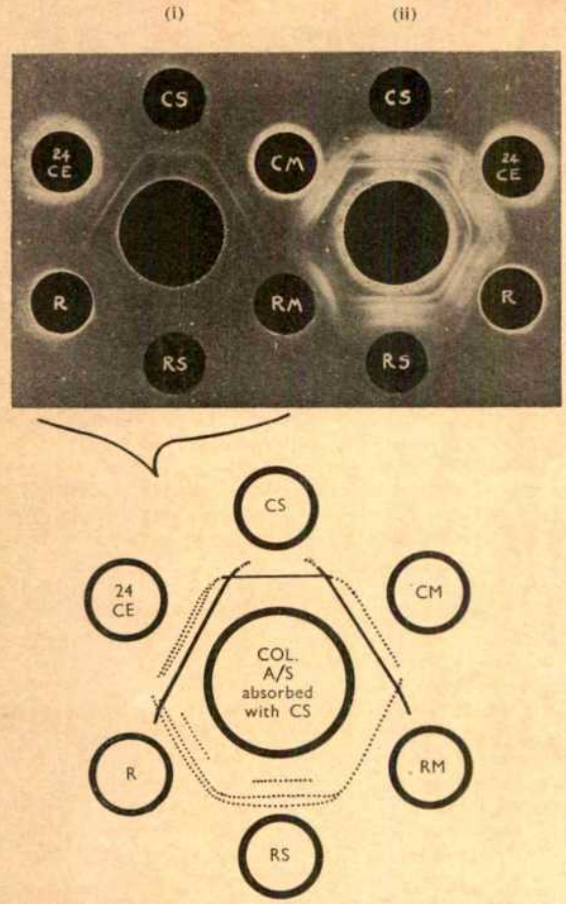

Fig. 5. Serological analyses of microsome fractions of wheat coleoptile, root and other extracts. The centre cup contained coleoptile antiserum: (i) absorbed with coleoptile extract from which the microsomes had been removed by centrifugation, and (ii) unabsorbed coleoptile antiserum. *CS*, supernatant remaining after removal of microsome particles from coleoptile protein extract by centrifugation; *CM*, coleoptile microsome fraction; *RM*, root microsome fraction; *RS*, supernatant remaining after removal of microsome particles from root protein extract; *R*, total root protein extract (that is, *RM* + *RS*); 24 *CE*, extract of coleoptiles (24 hr. after sowing) representing meristematic phase of growth

M/20, *p*H 7·6—the higher *p*H was chosen to facilitate dissociation—and the extract stored at 2° C. until required for testing.

This antiserum was afterwards tested against the microsome suspension and also a similar preparation of root microsomes. These reactions are shown with others in Fig. 5, the absorbed antiserum series on the left and the unabsorbed antiserum series on the right. To ensure that any precipitin line found to be associated with the microsome fraction was not due to incomplete absorption, a cup containing the supernatant used for absorption (*CS*) was included. The results revealed that the coleoptile microsome extract (Fig. 5i) contained two antigens when tested against the absorbed antiserum. One of these was present in the coleoptile supernatant (*CS*) and was therefore due to incomplete absorption, while the other antigen originated from the microsome fraction. In later experiments complete absorption of the antiserum was accomplished by absorbing with a larger volume of supernatant (*CS*) (Fig. 6). The position of the precipitin line associated with the microsome fraction relative to the antigen and antibody cups suggested that it was a molecule with a molecular weight of the order of thousands rather than millions. Even the monomer form of the microsome particle has a sedimentation constant in the region of 33*S*, which would imply a larger molecular weight. It would therefore appear that the 33*S* monomer must have broken down into even smaller units.

The question arises as to whether the antigenic activity resides in the typical microsome particle (69*S* + 50*S* + 33*S*) or in one or both of the 'heavy' microsome particles (peaks 0 and 1, Fig. 3*a*), or in the slower component (peak 5, Fig 3*a*). Two lines of evidence favoured the 69*S* (peak 2, Fig. 3*a*) component and its two dissociation components 50*S* (peak 3, Fig. 3*a*) and 33*S* (peak 4, Fig 3*a*) as the seat of antigenic activity; these were: (1) differential centrifugation followed by quantitative estimation[7] of the

A/S*) absorbed with the supernatant (*CS*) remaining after the microsome particles have been centrifuged from a coleoptile protein extract). *CM*, coleoptile microsome fraction; *LM*, leaf microsome fraction

distribution of the antigen component; (2) the fact that the antigen still remained in the supernatant under conditions when particles of 100*S* and above (that is, including peaks 0 and 1, Fig. 3*a*) would have centrifuged down. It is quite possible that peaks 0 and 1 are higher polymers of the 69*S* particle, but in these experiments the centrifuge speed was too high to determine the $S_{20,w}$ values accurately for these two peaks. Petermann *et al.*[8] have suggested a similar hypothesis for the 'heavy' microsomes of liver extracts.

The precipitin band associated with the microsome fraction of the coleoptile extract was absent from microsome fractions of root (Fig. 5i) and leaf (Fig. 7). With the coleoptile antiserum used in these experiments any organ-specific antigens associated with root and leaf microsomes would not be detected; but it seems probable that such antigens exist.

A further point of interest was the fact that an extract made from coleoptile cells during their meristematic phase of growth (24 *CE*, Fig. 5, ii) shared nearly all its precipitin lines with the root extract (*R*, Fig. 5, ii). The exceptions were those associated with the high molecular weight components. Thus it appears, with these exceptions, that a non-organ specific meristematic pattern of antigens has superimposed upon it, during differentiation, a combination of proteins characteristic of differentiated cells.

In conclusion, it is possible to visualize the primordial cells of an organ as containing their own characteristic microsome particles as well as many antigens possessed in common with other organs. Possibly also, organ-specific microsomes synthesize organ-specific proteins or a particular combination of non-organ-specific proteins, which would either, by their incorporation into the primordial cytoplasm, or by their enzymatic activity, lead to greater cellular specialization and thereby forward the process of cellular differentiation.

I wish to express thanks to Dr. P. G. H. Gell for his many valuable suggestions throughout the course of this work, to Dr. D. R. Stanworth and Miss P. Ratcliff for carrying out the analytical ultracentrifuge determinations and to Miss A. Hudson for technical assistance demanding much patience.

These results will be reported in detail elsewhere. The work was carried out under a grant from the Nuffield Foundation

SPECTROPHOTOMETRIC MEASUREMENT OF CYTOCHROMES IN THE RED AND THE WHITE MUSCLES OF THE AMERICAN COCKROACH, *PERIPLANETA AMERICANA* L.

By TSUTOMU NAKATSUGAWA

Second Laboratory of Insect Control, Division of Entomology, National Institute of Agricultural Sciences, Tokyo

SINCE the early report by Sacktor and Bodenstein[1], the red muscle of the male and the white one of the female American cockroach, *Periplaneta americana* L., have long been a subject of investigation, and parallelism between the coloration and the activity of oxidative enzymes of the muscles has been reported[2]. However, ordinary spectrophotometric measurement of the coloration was precluded by the turbidity of muscle. In the present experiment, the opal glass transmission method of Shibata[3] was adopted, instead of the usual spectroscopic method, which is subject to rather large errors, in an attempt to obtain quantitative or at least semi-quantitative data on the suspected difference in the content of cytochromes between the red and the white muscles of the American cockroach.

For observation of the muscle, red thoracic trochantinal and coxal muscles were collected from meso- and meta-thoraces of male adult insects; only the 'pink' muscles[4], which are identical with the red muscles of the male, were collected from the female thoraces. The muscles were soaked in 0·01 *M* diethyldithiocarbamate solution to prevent formation of melanin, which might occur. 30 mgm. of the solution was used for 100 mgm. of fresh muscle. The sample was kept in a Petri dish with a sheet of wet filter paper to avoid drying during the dissection. Then the sample was lightly ground with a small glass rod and a small amount of hydrosulphite was added.

For observation of the mitochrondria, muscles collected as above were homogenized in a glass homogenizer as a 2 per cent suspension in a solution of *p*H 7·4, containing 0·25 *M* sucrose, 0·05 *M* phosphate buffer and 0·01 *M* sodium ethylenediaminetetraacetate. On centrifuging the homogenate at 600*g* for 5 min., the precipitate was homogenized in a smaller quantity of the solution and the process was repeated five times. At the fifth extraction very few mitochondria were obtained. The resultant supernatant solution was centrifuged at 10,000*g* for 10 min. and the precipitate was washed twice by re-suspending and re-centrifuging. The procedures described above were carried out at about 4° C. The final suspension was shown microscopically to contain almost pure mitochondria, which were stained with janus green *B*. Mitochondria thus obtained show oxidative activity with α-glycerophosphate, succinate, L-glutamate, fumarate, L-malate, α-keto-glutarate and oxalacetate as substrates (un-

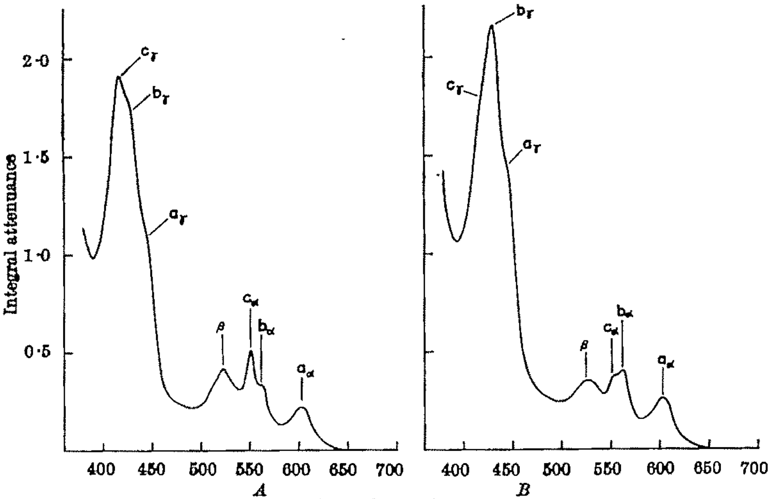

Fig. 1. Integral attenuance spectrum of (*A*) reduced red muscle of male adult American cockroach and (*B*) reduced mitochondria extracted from red muscle of male adult American cockroach, showing absorption maxima of $\alpha(a_\alpha, b_\alpha, c_\alpha)$, $\beta(\beta)$ and Soret $(a_\gamma, b_\gamma, c_\gamma)$ bands of cytochromes

published results). The final precipitate was left to drain for 1 min. with the centrifuging tube upside down. A few crystals of sodium hydrosulphite were added to the precipitate and thoroughly mixed with it.

Although muscle and mitochondria diffused light considerably to give clear absorption spectra, opal glass was used to make sure. A brass plate, 0·6 mm. thick, with a hole a little larger than the section of the incident beam of the spectrophotometer, was placed on a plate of opal glass. The sample was put in the hole of the brass plate and a plate of transparent glass was pressed on to the sample to form an optical cell containing the sample of a definite thickness. This was mounted on an opal glass attachment and the spectrum was taken in the region 380–700 mμ. From 380 to 500 mμ black tape was applied on the reference side to lower the base-line height of the spectrum.

Since spectra of semi-integral attenuance thus obtained were lowest and constant beyond 660 mμ, this constant base-line height was subtracted to obtain integral attenuance[3], assuming that the ratio of reflectance to transmittance was approximately constant in the wave-length range observed. The spectra showed the presence of cytochromes *a*, *b* and *c* both in the muscle and in the mitochondria. Typical spectra of the muscle and the mitochondria of the male cockroach are shown in Fig. 1. Spectra of the female preparations were qualitatively much the same as those of the male.

Table 1. INTEGRAL ATTENUANCE OF REDUCED MUSCLE AND MITOCHONDRIA AT ABSORPTION MAXIMA OF THE α-BANDS OF CYTOCHROMES

	Absorption maximum (mμ)	Integral attenuance		Male/Female
		Male	Female	
Muscle				
Cytochrome *a*	603	0·278	0·065	4·28
Cytochrome *b*	562	0·422	0·122	3·47
Cytochrome *c*	551	0·587	0·164	3·58
Mitochondria				
Cytochrome *a*	603	0·259	0·181	1·43
Cytochrome *b*	562	0·399	0·305	1·31
Cytochrome *c**	551	0·357	0·297	1·20
Dry matter of mitochondria (per cent)		19·5	18·6	

* Values for cytochrome *c* were reduced by washings

Though the absorption maximum of cytochrome *b* at about 562 mμ was obscured by the distinct absorption band of cytochrome *c*, which has its maximum at about 551 mμ, the attenuance at 562 mμ is considered to represent roughly the amount of cytochrome *b*, since cytochrome *c* absorbs light very little at this wave-length. For example, absorption at 562 mμ is about 10 per cent of that at 550 mμ in the case of the cytochrome *c* extracted from the thoracic muscle of the horn beetle, *Xylotrupes dichotomus* L. (unpublished results). In the case of mitochondria, however, cytochrome *c* was considerably washed out and the peaks of cytochrome *b* became rather clear both in the α region and in the Soret region; and cytochrome *b* was seen to remain in the mitochondria as well as cytochrome *a*. Experimental results are given in Table 1.

In all cases with muscle, the attenuance ratio of male to female was higher for cytochrome *a* than for cytochrome *c* or *b*. Though the values vary somewhat, probably with age of cockroaches, it is apparent that red muscle contains a much greater quantity of cytochromes than white muscle. On the other hand, there was no great difference in the concentration of cytochromes in mitochondria between male and female, both on a wet- and a dry-weight basis. As for the nature of mitochondria, it is not yet determined whether the mitochondrial fraction sedimented by the procedure employed is the only fraction that contains cytochromes, especially *a* and *b*. However, it seems likely that the difference in the content of cytochromes between the red and the white muscles is largely due to a greater amount of mitochondria in red muscle than in white muscle, and not so much to the difference in the concentration of cytochromes in mitochondria. In fact, red muscle yielded more than three times as much mitochondria as white muscle, both on a wet- and a dry-weight basis.

Though further experiment must be carried out to determine what substances contribute to the reddish coloration of the muscle of the American cockroach, I believe that cytochromes *a*, *b* and *c* are largely responsible. So far, I have not been able to detect any other substance in the intact and reduced muscles from their spectra.

Experiments are now in progress by this method to compare the content of cytochromes in muscles of various species of insects, and the results will be published elsewhere.

I thank Dr. J. Fukami, of this Laboratory, Mr. S Matsunaka of the Section of Physiology and Genetics, for advice, and Dr. H. Ishikura, chief of this Laboratory, for his interest and encouragement.

LETTERS TO THE EDITORS

COSMOLOGY

Pasteur and Cosmic Asymmetry

Yang and Lee's[1] discovery of the non-conservation of parity in certain interactions of "fundamental particles" has led to a general acceptance of the notion that the structure of the universe is asymmetrical. So far as I know this was first enunciated by Pasteur[2]. The following are his exact words :

"Il faut de toute nécessité que des actions dissymétriques président pendant la vie à l'élaboration des vrais principes immédiats naturels dissymétriques.

"Quelle peut être la nature de ces actions dissymétriques ? Je pense, quant à moi, qu'elles sont d'ordre cosmique. L'univers est un ensemble dissymétrique et je suis persuadé que la vie, telle qu'elle se manifeste à nous, est fonction de la dissymétrie de l'univers ou des conséquences qu'elle entraîne. *L'univers est dissymétrique.*"

The first sentence is, I think, the first enunciation of the principle that an asymmetrical phenomenon must have an asymmetrical cause. It would be of great interest to know why Pasteur, who believed that there was a sharp gap between vital and non-living processes, attributed the asymmetry to the universe, and not to a 'vital force' or some such agency acting in parts of it. Pasteur's conjecture may of course be disproved in either or both of two ways, namely by the discovery on other planets of living beings composed mainly of sugars and amino-acids of the D series, or by the synthesis of such beings by men. But until such disproof is forthcoming he deserves full credit for his formulation.

I have to thank Prof. Jacques Monod, of the Institut Pasteur, for most kindly furnishing me with Pasteur's exact wording, and for a valuable comment.

GEOPHYSICS

Effect of Latitude on the Diurnal Maximum of 'Dawn Chorus'

IT is known that chorus, or 'dawn chorus', exhibits a pronounced diurnal variation in its occurrence and that different stations show different local times for the diurnal maxima. These maxima have been shown to be a function of geomagnetic latitude by Allcock[1] and independently by Pope[2].

The observations used were samples taken at 3-hr. intervals, with a consequent limitation in time resolution (excepting those obtained by the College station). The availability of observations from a large number of stations with a time resolution of 1 hr. during the International Geophysical Year makes it desirable to reconsider the latitude effect.

The data were obtained in various ways. The Geophysical Institute operated field-stations at College and Kotzebue. The data for Dunedin, Wellington, Stanford, Boulder, Seattle, Anchorage and part of those from Unalaska were supplied by IGY Whistlers-West. The data from Bermuda, Washington, D.C., Norwich, Mont Joli, Knob Lake and part of those for Unalaska were supplied by IGY Whistlers-East. The Cambridge point was obtained from Storey's doctoral dissertation[3]. The time of maximum at Saskatoon was supplied by G. M. Allcock, of New Zealand. The Macquarie result was communicated directly by radio from that station.

With the exception of the last three stations, which used the occurrence of chorus, the diurnal curves were determined from hourly chorus indices. These indices are derived through a subjective estimate of the strength of the phenomenon. Using the strengths can be considered a weighting of the occurrences in favour of those close to the station. The difference between these two techniques of obtaining the diurnal maximum is probably small.

Table 1 gives the various 'whistler' stations used in this work along with the parameters involved.

Fig. 1 is a plot relating the local time of the diurnal maximum to geomagnetic latitude. The arrows attached to the data points indicate the extent and direction of correction for magnetic time. Observations from the eastern stations are plotted with solid points while those from the western stations are plotted as open points. It is apparent that the eastern stations tend to the left of the plot whereas the western tend to the right side. Thus there appears to be an 'east–west effect' in the time of diurnal maximum, which is probably a spurious effect.

Maeda[4] has considered the effect of a distortion of the Earth's magnetic field by rotation to explain the westward shift of the cosmic-ray equator noted by Simpson[5]. This westward shift would tend to reduce the east–west effect in the northern hemisphere. The Knob Lake station, being closer to the magnetic equator, would have a lower latitude, while the

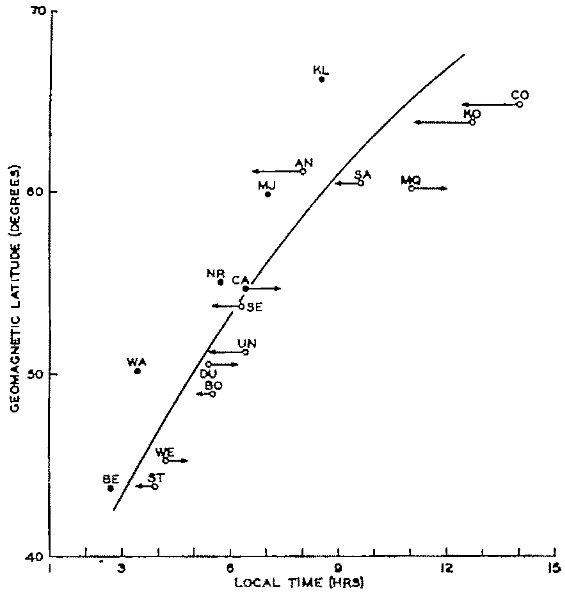

Fig. 1. Time of diurnal maximum versus geomagnetic latitude

College station, being farther from the equator, would have a higher latitude. This qualitative explanation, however, is not successful if the three southern hemisphere stations are considered, since they are all increased in latitude. Therefore, accepting the validity of the observations from the southern hemisphere stations, this westward shift of the geomagnetic equator fails to resolve the discrepancy without introducing others.

The use of geomagnetic latitudes derived from dip angles also fails to remove the discrepancy.

More success can be had by use of an eccentric dipole field. Parkinson and Cleary[6] have computed the position of the eccentric dipole-field poles for the epoch 1955. They are 81·0° N., 84·7° W. and 75·0° S., 120·4° E. Since these poles are not antipodal, the problem of computing effective geomagnetic latitudes is complicated. A simple approximation can be obtained, however, by computing the latitudes in each hemisphere separately as if the dipole were centred, using the appropriate pole. This approximation will, of course, produce a discontinuity at the equator. The latitudes using this approximation are tabulated and the results plotted in Fig. 2. The magnetic time corrections are plotted in the same manner as in Fig. 1. It is clear that while some scatter remains, the east–west effect has disappeared. In particular, the Knob Lake point is brought into reasonable agreement with the rest of the observations.

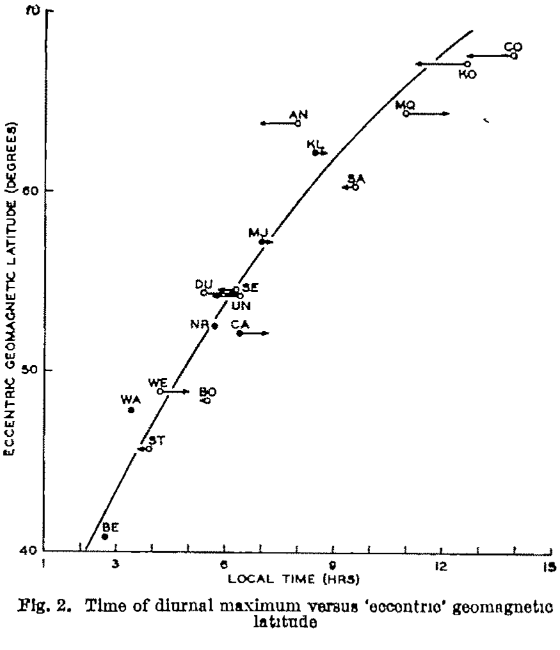

Fig. 2. Time of diurnal maximum versus 'eccentric' geomagnetic latitude

These results indicate that it is desirable to consider the use of the eccentric dipole field in connexion with theories of chorus. Also, the paths of whistler propagation may be affected by the eccentric field rather than the centred field, which may be an important consideration from the point of view of conjugate point experiments and electron density computations.

This work was supported by the U.S. Air Force Cambridge Research Center under Contract No. *AF* 19(604)–5574. The observations from College and Kotzebue during the International Geophysical Year were obtained under a National Science Foundation Grant (*IGY* 6.10). The comments of Dr. L. Owren are gratefully acknowledged.

Calculation of Cosmic-ray Ages in the Iron Meteorites 'Carbo' and 'Treysa'

In a recent communication[1], Dr. R. R. Marshall estimates the cosmic-ray age of the iron meteorite 'Carbo' to be 0·69 × 10^9 yr. His calculation was based upon the following experimental results of ours[2] and Barr's[3]. We showed that the relative isotopic abundances of potassium from a sample of the iron meteorite 'Carbo' were markedly different from those of terrestrial potassium. Considerable enrichment of the isotopes of masses 40 and 41 was found ($^{39}K_m$ = 79·5 per cent, $^{40}K_m$ = 4·8 per cent, and $^{41}K_m$ = 15·7 per cent as compared to 93·08, 0·012 and 6·91 per cent respectively for ordinary terrestrial potassium). Evidence was given that a considerable amount of this meteoritic potassium—nearly all the potassium-40 and more than half the potassium-41—is of cosmogenic origin, that is, it is a reaction product of the spallation of mainly iron nuclides, induced by high-energy particles from cosmic radiation. Barr[3] measured the cross-sections for the production of fifty-nine radioactive isotopes formed by 5·7-BeV. proton bombardment of copper. From his summary of measured and interpolated independent cross-sections, Marshall calculated the total cross-sections for the production of the potassium isotopes to be σ_{39} = 14·8 mb., σ_{40} = 9·4 mb., and σ_{41} = 14·7 mb.

The method of determining the cosmic-radiation age of meteorites is based on the fact that a stable and a radioactive isotope (potassium-41 and potassium-40) are formed at the same time. During the time the meteorite is exposed to cosmic radiation, the ratio of potassium-41 to potassium-40 increases with time due to the radioactive decay of potassium-40. Besides the difficulty of measurement of isotopic abundance on the small amounts of meteoritic potassium available, the exact determination of such a potassium-41/potassium-40 age for a given meteorite is mainly a question of knowing the ratio σ_{41}/σ_{40} of the production cross-section for potassium by cosmic-ray bombardment of iron meteorites. The use of observations from a 5·7-BeV. proton bombardment of copper for the age determination of iron meteorites can only be considered as an approximate solution of the problem.

In a re-calculation of the cosmic-radiation age from the preceding values for the relative isotopic abundances and the production cross-sections, and with a value of λ taken as $0{\cdot}54 \times 10^{-9}$ yr.$^{-1}$, we found the cosmic-ray age of 'Carbo' to be $T = 1{\cdot}36 \times 10^9$ yr., instead of $0{\cdot}69 \times 10^9$ yr. as calculated by Marshall. We both used the same formula and practically the same numerical constants, with the exception that we defined R as the ratio potassium-39/potassium-41 in ordinary potassium instead of potassium-39/potassium-40 as is defined in Marshall's paper. As this difference alone cannot explain the discrepancy in the two results of age calculation, there appears to be another error in Marshall's work which we are not quite able to understand.

As the results of our isotopic abundance measurements on the extremely small potassium samples available for measurements still show rather large statistical fluctuations[4], the uncertainties in the cosmic-radiation ages are relatively large. We calculate the radiation age T from the equation (see equation (3) in our paper[4]):

$$\frac{\lambda T}{1-\exp.(-\lambda T)} = \frac{({}^{41}\mathrm{K}_m - a\,{}^{39}\mathrm{K}_m)/{}^{40}\mathrm{K}_m}{\dfrac{\sigma_{41}}{\sigma_{40}}\left(1 - a\,\dfrac{\sigma_{39}}{\sigma_{41}}\right)} \tag{1}$$

where a is ${}^{41}\mathrm{K}/{}^{39}\mathrm{K}$ in ordinary potassium (this corresponds to Marshall's equation if $R = 1/a = {}^{39}\mathrm{K}/{}^{41}\mathrm{K}$ and not ${}^{39}\mathrm{K}/{}^{40}\mathrm{K}$). From the scattering in the experimental results for $({}^{44}\mathrm{K}_m - a\,{}^{39}\mathrm{K}_m)/{}^{40}\mathrm{K}_m$ (1·90 ... 2·05 for potassium from 'Carbo' and 1·65 ... 1·72 for potassium from 'Treysa'), we obtain the following limits for the radiation ages of the iron meteorites 'Carbo' and 'Treysa', using the cross-sections as given above:

$$\begin{aligned} &\text{'Carbo'}: \quad T_C = (1{\cdot}05 \ldots 1{\cdot}40) \times 10^9 \text{ yr.} \\ &\text{'Treysa'}: \quad T_T = (0{\cdot}50 \ldots 0{\cdot}67) \times 10^9 \text{ yr.} \end{aligned} \tag{2}$$

The uncertainty in the assumptions upon which the age determination is based and particularly the adoption of a relatively uncertain value for the ratio of σ_{41}/σ_{40} still require a very reserved interpretation of these ages. This is the reason why, in our own treatment of the potassium-41/potassium-40 age problem[4], we eliminated the production cross-sections. In that way we obtained the following relation for the difference of the cosmic-ray age of 'Carbo' and 'Treysa' only:

$$0{\cdot}35 \times 10^9 \text{ yr.} < T_C - T_T < 1{\cdot}25 \times 10^9 \text{ yr.} \tag{3}$$

The rather wide range for this difference depends upon the scattering of experimental results and on the possibility that the absolute radiation age of 'Carbo' may have any value between several times 10^8 and $4{\cdot}5 \times 10^9$ yr. so long as no special assumptions are made regarding the production cross-sections. The value of the upper limit of the difference holds if the radiation age of 'Carbo' should be as high as $4{\cdot}5 \times 10^9$ yr., as is theoretically possible (although very unlikely). The estimate (3) is consistent with the preceding results (2) on the radiation ages themselves, but has a much higher degree of certainty since the statement is completely independent of the ratio σ_{41}/σ_{40}. The existence of such a difference of several hundred millions of years for the radiation ages of iron meteorites is in itself a remarkable fact.

We wish to thank Dr. F. Begemann of this Institute for valuable discussions.

[2] Voshage, H., and Hintenberger, H., *Z. Naturforsch.*, **14a**, 194 (1959).

[3] Barr, D. W., thesis, University of California, Radiation Laboratory Report 3793 (1957).

[4] Voshage, H., and Hintenberger, H., *Z. Naturforsch.*, **14a**, 828 (1959).

IN the last sentence of the second paragraph of my original, ${}^{40}\mathrm{K}$ was misread for ${}^{41}\mathrm{K}$; the definition should read: R is the ratio of ${}^{39}\mathrm{K}/{}^{41}\mathrm{K}$. Similarly, at the end of par. 4, σ_{29} should read σ_{39}, and in par. 5, line 17, σ_{40} should read σ_{39}. An error in the numerical evaluation of the radiation age led to a figure exactly half that of the correct value. Therefore, in both par. 5, line 2, and in par. 7, line 6, $0{\cdot}6_9$ should read $1{\cdot}3_8 \times 10^9$ years. Fortunately, these corrections do not affect either the principle of the calculation or, in general, the comparisons drawn in this letter.

I am grateful to Dr. H. Voshage and Dr. H. Hintenberger for directing attention to these discrepancies.

RADIOPHYSICS

Solar Radio Bursts and Low-energy Cosmic-rays

THE recent discovery, by equipment carried in satellites and balloons, that the terrestrial atmosphere is frequently bombarded by solar protons of energies 30–300 MeV.[1,2], has given rise to much speculation concerning the origin of these low-energy cosmic rays, and their relation to solar radio bursts, flares, and terrestrial disturbances. In this communication we seek to elucidate these problems from a consideration of radio spectral observations of the Sun. The radio data were obtained at the Harvard Radio Astronomy Station, Fort Davis, Texas, with sweep-frequency receivers[3] covering the range 25–580 Mc./s. The equipment scans the entire frequency-range three times per second, and a continuous record of solar radio bursts has been obtained from sunrise to sunset for the past three years.

The observations show that the radio bursts which are associated with the ejection of low-energy cosmic rays from the Sun take the form of an intense continuum, sometimes known as spectral Type IV. This radiation characteristically covers several octaves of the radio spectrum, shows only gradual changes in intensity and frequency-range, and often lasts for many hours. It probably originates in a synchrotron mechanism[4], in which electrons with relativistic velocities are trapped in orbital motion in a magnetic field. About 15 such bursts have been recorded at Fort Davis each year during the solar maximum.

The continuum radiation is related to the ejection of low-energy cosmic rays from the Sun by a sequence of events which commences with a solar flare, usually of class 3 or 3+ (ref. 5). The flare is followed, with an average delay of 12 min., by an outburst of continuum radiation, and approximately 1 hr. later an enhanced flux of protons arrives at the Earth. Their energies, as measured by Geiger and scintillation counters carried in balloons and satellites, lie in the range 30–300 MeV., which corresponds to particle velocities of 0·2–0·7 c. Because of their low rigidity, the protons can penetrate the terrestrial atmosphere only in the vicinity of the magnetic poles, where they give rise to ionospheric absorption of very-high-frequency radio waves over the polar cap[6,7]. These polar blackouts, resulting from enhanced ionization in the *D* region of the ionosphere, at present constitute the best parameter for measuring the arrival time of the solar particles at the Earth. The minimum time delay between the onset of the solar continuum radiation and the polar blackouts is 0·7 hr.

It may be suggested that at the time the optical flare is observed, a stream of protons and electrons is ejected violently outwards from the flare region, at a velocity of approximately 0·5 c. The electrons in this stream are afterwards trapped in orbital motion in a magnetic field in the coronal levels above the active area, and generate energy in the radio band of electromagnetic spectrum. (The strength of the magnetic field, as indicated by the splitting of slow-drift radio bursts, is of the order 1–10 gauss.) The protons are not captured by the magnetic field and continue to travel outwards at high velocity, spiralling along elongated lines of force that stream from the Sun into the interplanetary plasma[8]. A travel time of 0·7 hr. over a direct path between the Sun and the Earth corresponds to a particle velocity of 0·2 c. For spiral paths the velocities will be proportionately higher. Such velocities are in accord with those deduced from direct measurements of the particle energies.

The heliographic distribution of the flares associated with continuum radiation is given in Fig. 1, and their importance distribution in Table 1. It will be seen that there is a highly significant western excess of flares associated with the ejection of low-energy cosmic rays that afterwards reached the Earth, and that most of these flares were of importance 3. The western excess has also been noted by Reid and Leinbach[7], who surmise that the connective magnetic lines of force between the Sun and the Earth emanate mainly from the western hemisphere of the Sun. These are possibly the remnants of earlier auroral corpuscular streams which have followed the well-known curved path described in the early literature by Chapman[9].

The solar protons have now been detected directly by satellite and balloon equipment on nine separate occasions. In all cases they were associated with ionospheric absorption phenomena in the polar regions. The available radio data also show that the emission of these solar protons is always preceded by outbursts of continuum radiation. In approximately 75 per cent of cases they have also been succeeded, within a few days, by a geomagnetic storm, and a Forbush decrease in extra-solar cosmic-ray intensity. There is at present some disagreement concerning the relation of magnetic storms to solar radio bursts, but a detailed analysis[10] of the phenomena suggests that the emission of auroral streams, that is, particles with velocities of 1,000 km./s. (0·003 c.), is not primarily associated with solar continuum radiation, but rather with the occurrence of slow drift (Type II) radio bursts. Further analysis also suggests that noise storm bursts (Type I) and fast drift bursts (Type III) are inconsequential with regard to the terrestrial disturbances considered in this communication.

Table 1. Importance Classification of Flares associated with Continuum (Type IV) Radio Bursts, May 1, 1957–July 31, 1959

Importance of associated flare	Number of continuum outbursts	
	Followed by polar blackouts	Not followed by polar blackouts
3, 3+	8	3
2, 2+	2	9
1, 1+	0	7

PHYSICS

Variation with Temperature of the Magnetic Susceptibility of Some Transition Elements

The dependence on temperature of the magnetic susceptibilities of the transition elements has been measured over various ranges of temperatures[1], and a series of experiments is now being carried out in this Department in an attempt to confirm some of the results and extend others in the temperature range 20°–1,800° C. Preliminary results have been obtained for the elements platinum, rhodium,

Table 1

Temp. (° C.)	Susceptibility (e.m.u. gm.$^{-1}$ × 10^{-6}) Ti	Zr	Nb	Ta	Rh	Pt
20	3·35	1·32	2·28	0·85	1·05	0·97
250	3·65	1·36	2·08	0·83	1·13	0·85
500	4·18	1·39	2·00	0·80	1·25	0·73
750	4·26	1·45	1·90	0·77	1·37	0·64
1,000	5·39	1·64	1·81	0·75	1·48	0·56
1,250	5·25		1·74	0·73	1·56	0·50
1,500			1·71	0·72	1·64	0·45
1,750			1·69	0·715		0·40

zirconium, titanium, tantalum and niobium. The room temperature values of the susceptibilities (measured by comparison with platinum at room temperatures) and the values at temperature intervals up to 1,750° C. are given in Table 1.

The elements used were Johnson–Matthey 'Specpure', and no appreciable dependence of susceptibility on field-strength was observed. The error in the room temperature values is estimated as $\pm 0{\cdot}05 \times 10^{-6}$ e.m.u. gm.$^{-1}$. The values given in Table 1 for titanium and zirconium are in quite good agreement with the results of Squire and Kauffmann[2] (the temperatures at which the discontinuities in the $\chi - T$ curves occur being 860° C. for titanium and 880° for zirconium). The values for niobium and tantalum are similar to those of Kriessman[3].

These results supplement the evidence cited by Kriessman and Callen[1] to show that the dependence on temperature of the susceptibility of the transition elements has the same general form for each element in a particular column of the Periodic Table.

Measurements are being made on other transition elements, and a fuller account will be submitted elsewhere.

Surface Characteristics of Fractured Poly(methyl methacrylate)

A study of fracture phenomena in poly(methyl methacrylate) has been undertaken, which involves the breaking, in tension, of strip samples, each containing a preformed crack which lies in a plane normal to the long axis (Fig. 1). The samples are extended at fixed rates of elongation until rupture ensues, invariably at the site of the initial crack. It appears by visual inspection that the fracture process occurs in two distinct stages. The crack starts to grow fairly slowly at a velocity which is of the order of 0·1 cm./sec., until a critical stage is reached when the velocity suddenly increases to a value of at least 10^4 cm./sec. It is not yet known what factor is critical in producing the transition. The final high velocity is possibly the theoretical maximum, limited by the velocity of a longitudinal wave in the medium[1], but no accurate measurements have yet been made. A sharp characteristic audible effect is associated with the rapid stage of crack growth.

On examination of the fracture surface, the regions corresponding to the above behaviour can be readily distinguished. Two matching fracture surfaces (that is, from the same sample) are shown in Fig. 2. In the region of slow crack growth, the surface is irregular, with deep lines of level differences, usually running in the direction of crack propagation. The increase in crack velocity is indicated by a change in the character of the surface. It becomes smoother and highly reflecting, with only shallow lines of level-differences. In this 'fast' region the degree of roughness increases, and the occurrence of the familiar parabolic figures[2] obtrudes as the distance from the initial crack increases, though this transition is gradual. The area occupied by these separate regions decreases as the length of the initial crack decreases; and in samples which do not contain deliberate cracks initially, the regions lie so close to the origin of the crack that they cannot readily be distinguished.

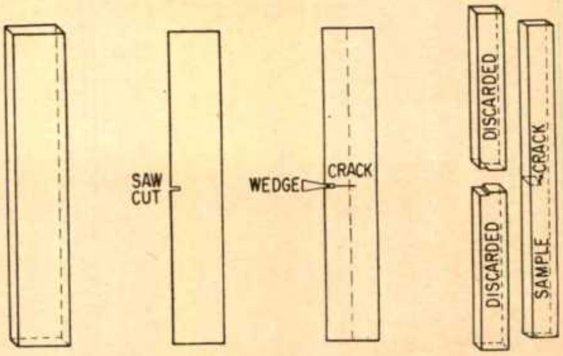

Fig. 1. Method of preparation of tensile samples (the position of the broken line in the third stage, along which the strip is cut to give the sample, determines the depth of the crack)

Perhaps the most surprising feature of the fracture surfaces formed under these conditions is the colour effects which are observed. These are readily visible to the naked eye, but are best seen under a low-power microscope (× 10) with vertical illumination. In the highly reflecting region, fringes or bands are observed, the colours of which vary in regular order with increasing distance from the initial crack. Second- and possibly higher-order 'spectra' can usually be seen before the effect is lost because of increasing roughness of the surface. Careful examination of the fringes on the fracture surface of one-half of the broken sample reveals that they do not run continuously across the surface, but occupy alternate regions bounded by the lines of level-differences.

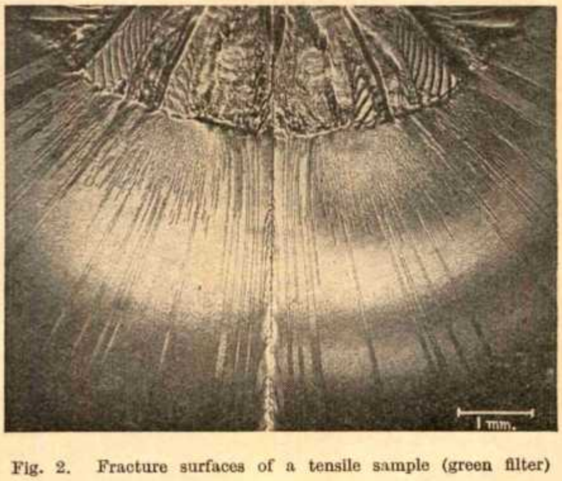

Fig. 2. Fracture surfaces of a tensile sample (green filter)

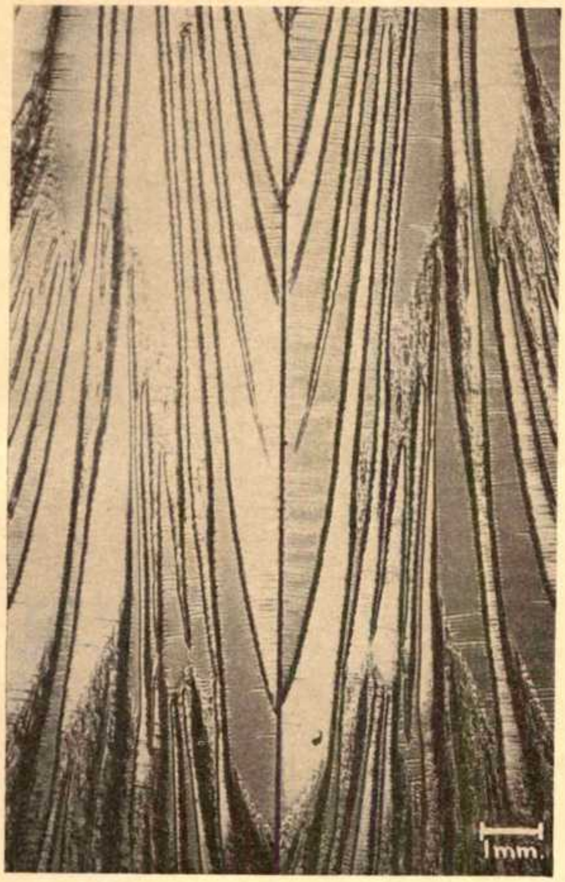

Fig. 3. Fracture surfaces of a cleavage sample (green filter)

In the intervening regions, a second set of fringes can be observed, the colours of which appear to be complementary to the first set. If the two matching fracture surfaces are examined simultaneously (Fig. 2), this duality persists in the second half of the sample, but the order of the fringes is inverted. Thus the colour fringes in the corresponding areas on the two surfaces, as defined by the lines of level-differences, exhibit the same complementarity found in adjacent regions on any one of the surfaces.

In the initial region, where the crack is growing slowly, colour effects are also observed, but they can best be produced under conditions where the rate of growth of the crack can be more readily controlled, as in a cleavage experiment (Fig. 3). In this case, fringes are not produced, and the colours are remarkably constant in hue over large areas. The same phenomenon of the complementary colours in corresponding and adjacent regions is still present, however. Colour effects have also been produced by an impact type of fracture process, as recently reported by Wolock[3].

It is believed that some of the observations noted above can be ascribed to optical interference at the surface. As the crack progresses through the (glassy) polymer, the high stresses at the tip will tend to orient the macromolecules in a direction parallel to the applied stress and hence normal to the direction of the crack and the final fracture surface. The extent to which orientation occurs will depend on the magnitude of the stress at the tip of the crack, the time for which it is applied and hence the instantaneous velocity of the crack, the temperature at the crack tip, and the viscous properties of the polymer. The refractive index along the individual polymer chains is different from that in a perpendicular direction. Hence, if the orientation of the polymer chains extends down to a specific depth into the bulk material, the result will be the same as that of a thin film on a substrate of different refractive index. This can therefore give rise to interference colours. The occurrence of colour fringes in the region of rapid crack growth can be interpreted as changes in the thickness of the film, that is, extent of orientation, as the crack progresses. In the region where the crack is growing slowly (1 mm./min. in a cleavage experiment), the film would be considered to be of remarkably constant thickness.

The orientation hypothesis is supported by other evidence. Thus the colours are thermolabile, and are destroyed by solvent in the liquid or vapour phase. There is a great discrepancy between the observed ($\sim 4 \times 10^5$ ergs/cm.^{2})[4] and calculated ($\sim 10^3$ ergs/cm.^{2}) surface energy for this material, the latter value having been computed from the energy required to rupture the chemical bonds in unit area of cross-section, assuming perfect orientation (cf. ref. 5). Clearly, a considerable amount of energy is required to produce the extent of orientation necessary to give the interference effect postulated above. However, evidence for the orientation hypothesis is still far from complete, and no reasonable explanation has been formulated for the complementarity effect which has been described above.

Flow of Electrolyte within a Propagating Stress-Corrosion Crack

THE observed corrosion potential at the mouth of a propagating crack in stressed Cu_3Au immersed in $FeCl_3$ is as much as 0·1 V. negative relative to that at uncracked parts of the surface[1]. This suggests that the advancing crack edge is dissolving anodically at an even lower potential. Potential measurements on stress-corroding wires of 18–8 steel in hot magnesium chloride solution[2,3], where the average corrosion potential during cracking is only about 0·06 V. above the reversible potential, suggest further that the potential at the advancing edges must in fact be very close to the reversible value. This led Hoar and West[4] to study the electrochemistry of 18–8 surfaces made to represent, on a macroscopic scale, the yielding material at such edges. Their experiments showed that dissolution of yielding 18–8 proceeds at the reversible potential provided that concentration over-potential is eliminated by flowing electrolyte past the surface at a suitable rate. It may be inferred that the advancing edge of a propagating stress-corrosion crack dissolves continuously into substantially virgin electrolyte, in view of the concomitant yawning.

This hypothesis has been tested by using two rather simplified crack models, and it has been found that, provided that the sides of the crack are strongly wetted, electrolyte is readily transferred from the crack mouth to the propagating edge, although in the models used some mixing with the crack electrolyte took place.

Two pieces of 'Perspex' apparatus were used:

(*a*) *Apparatus A* : a curved surface is allowed to bend away from a plane one, so that the 'crack' between them progressively yawns and is propagated at 0·5–10 cm./sec. This model most closely represents a true stress-corroding crack, although the 'profile ratio' (that is, crack-length divided by the amount of yawning at the mouth) is rather smaller (20 : 1) than that normally obtaining (nearer 100 : 1 for 18–8). The crack can be propagated a total distance of 5 cm., at which point it encounters a probe Ag,AgCl electrode. Provision is made for injecting chloride ions or a suitable dye into the electrolyte just in front of the crack mouth.

(*b*) *Apparatus B* : two straight surfaces are slid over one another at a rate of 0·2–5 cm./sec. The angle of contact, which determines the profile ratio, may be adjusted to give ratios between 15 : 1 and ∞ : 1 and the probe electrode is situated always at the advancing crack edge. Again, there is provision for injecting a 'marker' solution just in front of the crack mouth. The sliding action is thought to militate against indrawing of fresh electrolyte instantaneously to the crack edge, in view of the stirring produced, so that any positive results are probably conservative.

While neither apparatus gave rise to any sudden discontinuity in the potential of the probe electrode when saturated potassium chloride flowed past the mouth of a crack being propagated in tap water as electrolyte, measurable effects occurred when 'Teepol' was present. If we convert the observed potential-changes into changes in chloride ion concentration, apparatus *A* exhibited local concentration increases at the advancing edge of between 1·1 and 1·9 times. For apparatus *B*, where the average crack length was 4–5 cm. and the propagation-rate about 2 cm./sec. (that is, some 10^4 times the propagation-rate in true stress-corrosion cracks in 18–8), the local concentration change was 1·7–4·5 times. Oddly, the concentration rise at the crack edge in apparatus *B* did not seem unduly dependent upon profile ratios up to 100 : 1, although as expected a ratio of ∞ : 1 (that is, a closed crack) led to no rise. The addition of saturated potassium chloride directly to the vicinity of a similar electrode gave a local concentration rise of about 20 times.

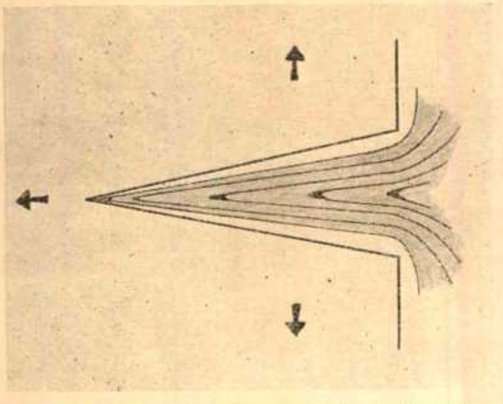

Fig. 1. Flow of electrolyte into propagating crack (with scale greatly exaggerated in the vertical direction)

With alcohol as electrolyte and deep red dye as 'marker', solution flow into a propagating crack was observed as in Fig. 1. So far as it was possible to tell, dye was conveyed instantaneously to the crack edge in apparatus *A* but results were less clear for apparatus *B*.

It may reasonably be concluded that, for long thin propagating cracks, anodic dissolution occurs into electrolyte contaminated no more than five times (the 'best' value from apparatus *B* was 20/4·5 = 4·4 times) by the previous crack contents, so long as the electrolyte thoroughly wets the sides of the crack. Owing to the inferred electrochemical nature of crack propagation in 18–8 steels[2,4], where capillarity must be such as to cause hot chloride solution to penetrate each crack right to the advancing edge, it is probable that wetting in this instance is similar to that which obtains for alcohol and aqueous solutions of 'Teepol' on surfaces of 'Perspex'.

GEOLOGY

Radiocarbon Measurements and Annual Rings in Cave Formations

The radiocarbon method has been used to test the hypothesis that the prominent rings found in certain calcite deposits of Moaning Cave in California represent annual growth variations. Carbon-14 analyses were made on two samples taken from a presumably active section of travertine covering a human femur (Fig. 1). When discovered in 1951, the specimen had 1,206 identifiable rings with an estimated 200 additional rings obscured[1]. Thus, if these rings formed annually and without interruption the bone at the centre became the nucleus of the cave formation about 1,400 years ago.

The locations of the two samples (*L*-530*A* and *L*-530*C*) taken for radiocarbon analysis are shown in Fig. 1. The two dotted lines overlie rings which on a geometrical basis have the mean age of the analysed material. In determining the position of these dotted lines a linear rate of growth is assumed. The radiocarbon concentration of the ring corresponding to the dotted line should thus be equal to the average radiocarbon concentration of the entire sample.

In Table 1 are the results of the radiocarbon analyses, expressed as fractions of the carbon-14/carbon-12 ratio in age-corrected pre-1900 woods (tree-ring samples corrected for decay of carbon-14 between the growth date and the present). The results in column 4 are uncorrected for isotope fractionation effects, while those in column 6 are normalized to a common carbon-13 concentration based on the estimated carbon-13 values given in column 5. The results in column 6 may be thought of as those which would have been obtained if isotope fractionation did not occur in Nature.

Table 1

Sample	Location in specimen (cm.)	Depth to mean age	Fraction pre-1900 wood $^{14}C/^{12}C$	δ ^{13}C* per mil	Normalized fraction pre-1900 wood $^{14}C/^{12}C$
L-530*A*	6·1–8·8	7·5	0·931 ± 0·017	(−5)	0·890 ± 0·017
L-530*C*	0·0–2·6	1·3	0·826 ± 0·010	(−5)	0·784 ± 0·010

* Relative to the Belemnite standard.

In computing ages from these results the main problem is that the initial carbon-14/carbon-12 ratio in the samples cannot be independently estimated. As shown by Deevey *et al.*[2], freshwater carbonates can have abnormally low carbon-14/carbon-12 ratios because of the incorporation of carbon derived from old limestones. In no case, however, could the samples, when deposited, have had carbon-14/carbon-12 ratios exceeding that in age-corrected pre-1900 wood. This means that upper limits can be set on the ages of the two samples by directly inserting into the carbon-14 age equation the ratios in column 6. The results are 950 years for sample *L*-530*A* and 1,950 years for sample *L*-530*C*.

Without even knowing the original carbon-14/carbon-12 ratio of the deposited carbonate, a more meaningful estimate can be made in the following way. If in the section considered the carbon-14/carbon-12 ratio in newly deposited calcite is assumed to remain constant with time, the difference between the radiocarbon concentration in the two samples is a direct indication of the average time intervening between their deposition. The calculations indicate that the 1·3-cm. layer was deposited 1,000 ± 200 years earlier than the 7·5-cm. layer. If the rate of accumulation between the 0·0- and the 1·3-cm. levels is assumed to be the same as the average rate over the 1·3–7·5-cm. span, the time required to deposit the first 1·3 cm. of calcite was 200 years. Similar reasoning yields 200 years for the time interval between the 7·5-cm. level and the surface of the specimen (8·8 cm.). Hence, based on the assumptions of constant initial carbon-14/carbon-12 ratio and of a linear growth-rate, the accumulation period for the entire 8·8 cm. of travertine is estimated as 1,400 ± 250 years. It should be noted that this conclusion is independent of the time at which deposition ceased.

The further assumption that the formation was actively growing when the specimen was collected makes possible an estimate of the initial carbon-14/carbon-12 ratio. In this event the 7·5-cm. level would have an age of 200 years and the 1·3-cm. level an age of 1,200 years. This assumption fixes the initial carbon-14/carbon-12 ratio of newly deposited carbonate at 0·915 that in age-corrected pre-1900 wood.

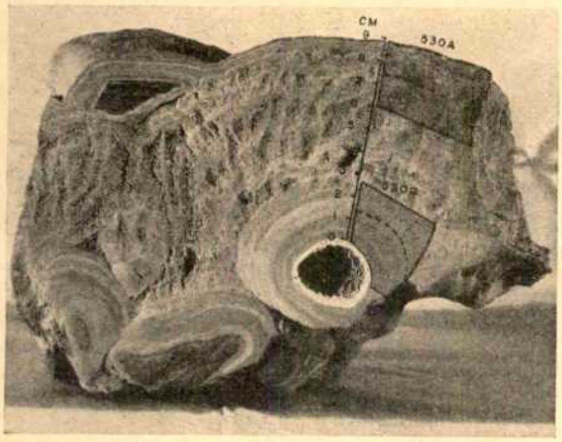

Fig. 1. Photograph of section cut through travertine deposit. The location of the samples analysed for carbon-14 are outlined. The age computed for the dotted mid-line for sample *L*-530*A* is 200 ± 100 and for the dotted mid-line of *L*-530*C* is 1,200 ± 200

It is of interest to compare this result with that obtained on a sample of recently formed calcite from Crystal Palace Cave located in Tuolume County, California. Supplied by R. de Saussure, this sample consisted of calcite covering and replacing a piece of wood found in the cave. A radiocarbon analysis of the wood yielded an age of less than 150 years and confirmed de Saussure's contention that it was a recent addition to the cave. The carbon-14/carbon-12 ratio for the calcite was 0·937 (± 0·008) that in age-corrected pre-1900 wood. When normalized for isotope fractionation, the result becomes 0·901 ± 0·008 (based on δ-carbon-13 = − 7·2‰)—in good agreement with the value of 0·915 required for the Moaning Cave samples.

In the literature, most of the published results for terrestrial waters are less than 0·90. For example, Deevey *et al.*[2] give values around 0·80 for alkaline lakes, while Brinkman, Munnich and Vogel[3] cite values of 0·66–0·84 for alkaline ground water. In addition, Broecker and Walton[4] give 0·67 as the average for the dissolved carbonate in rivers draining sedimentary areas. However, Broecker and Walton[4] find values of 0·90–0·98 for streams draining igneous areas devoid of carbonate rocks. This difference between 'igneous' and 'sedimentary' rivers arises from the fact that the bicarbonate in rivers draining only silicate rocks is almost entirely from soil carbon dioxide which has reacted with silicate minerals, whereas in carbonate areas the bicarbonate of the carbon is derived partly from soil carbon dioxide and partly from limestone free of carbon-14. (Soil carbon dioxide has a carbon-14/carbon-12 ratio approximately equal to that in contemporary wood.) Although the samples reported here are from limestone caves, the waters entering these caves apparently have derived nearly all their bicarbonate from soil carbon dioxide.

In conclusion, then, the radiocarbon results suggest that the rings observed in the travertine are annual, probably reflecting seasonal changes in the mode of deposition. This is consistent with Orr's[1] study of calcite coatings on nails which had remained in Moaning Cave for 29 years (1922–51). Using high magnification he found up to 29 rings. Whether this applies to cave formations in general awaits similar studies on other deposits. The present study merely demonstrates how the radiocarbon method can be applied to such problems.

CHEMISTRY

Substitution Reactions of Cobaltic Complexes catalysed by Adsorption

THE rate of the reduction of the complexes $[Co(NH_3)_5X]$ at the dropping mercury electrode depends on the nature of the supporting electrolyte and increases in the order: $SO_4^{=} \ll ClO_4^- < NO_3^- < Cl^- < Br^-$ as is manifested by the shift of the half-wave potential of the reduction wave with the change of the supporting electrolyte. The halides Cl^-, Br^- (and under suitable conditions also I^-) cause a further, quite different effect: at a certain concentration of the halide ion a new reduction wave appears which starts from the potential of the dissolution of mercury. The relative height of this wave (that is, the ratio of the positive wave to the total diffusion current) increases non-linearly with increasing concentration of the anion until all the complex is reduced in this positive wave (Fig. 1).

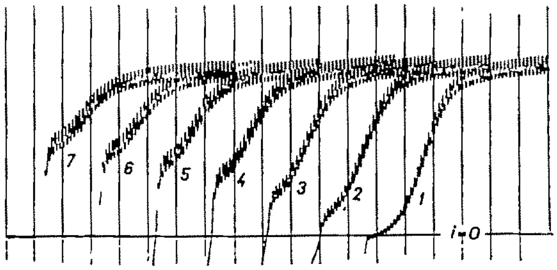

Fig 1. The influence of Br^- ions on the reduction wave of $[Co(NH_3)_5.H_2O]^{3+}$.
Solution. 0 1 *M* $HClO_4$, 0·9 *M* $NaClO_4$, 2×10^{-3} *M* $[Co(NH_3)_5H_2O].(ClO_4)_3$.
Curve 1, 0, 2, 2×10^{-4}; 3, 4×10^{-4}; 4, 6×10^{-4}; 5, 8×10^{-4}; 6, 10×10^{-4}; 7, 12×10^{-4} *M* NaBr.
100 mV./Absc, from −0·2 V. against mercurous sulphate electrode; *S* = 1 40

The concentration of the anion necessary for the development of the positive wave of given relative height depends on the nature of the anion: Cl^- ions have a much smaller effect than Br^- ions. Also the nature and concentration of other anions present in the solution influence the relative height of the positive wave, the latter being highest in solutions of pure halides and decreasing by addition of ClO_4^-, NO_3^- or $SO_4^{=}$ ions.

This behaviour suggests that the addition of halides changes the mechanism of the reduction of the cobaltic complex. This is further supported by the fact that the variation of the positive wave with the height of the mercury reservoir shows that, if the relative height of the first wave is small, the transport of the depolarizer to the electrode surface is governed not by diffusion but rather resembles that governed by a reaction preceding the electrode reaction proper. Furthermore, the properties of the positive wave are almost identical with those of the wave of $[Co(NH_3)_5Cl]^{2+}$ or $[Co(NH_3)_5Br]^{2+}$ (Vlček, A. A., unpublished results), so that these ions are probably the actual depolarizing particles. From this it could be concluded that in presence of halides the reaction:

$$[Co(NH_3)_5X]^{2+} + Cl^- \underset{k}{\rightarrow} [Co(NH_3)_5Cl]^{2+} + X^- \qquad (1)$$

(or similarly with Br^- or I^-) occurs in the solution surrounding the electrode and furnishes the actual depolarizer. Then the height of the first wave would be given by the rate of the homogeneous reaction (1). The value of the rate constant k measured by other methods[1] for the reaction of the $[Co(NH_3)_5H_2O]^{3+}$ with Cl^- ions is of the order of 10^{-5}(mol./l.)$^{-1}s^{-1}$, and it is thus impossible that the reaction in the solution near the electrode would contribute to the positive wave: the rate constant necessary for the observed currents would have to be at least 10^7 times higher than that measured in the solution.

To explain all the observed phenomena it has to be assumed that the particle actually exchanging the electrons with the electrode at the potential of the first wave is supplied by a chemical reaction proceeding directly at the electrode surface, the reactants being in the adsorbed state. This assumption that the reaction proceeds as a heterogeneous one is supported by the study of the current-time curves at constant potential. For small relative heights these curves obey the equation $i = \text{const.} \times t^{\alpha}$, where $\alpha > 2/3$, which is a property characteristic of processes in which absorption plays a decisive part[2]. The influence of surface-active substances, in the presence of which the relative height of the first wave is diminished, points to the same conclusion.

When a reaction proceeds directly at the electrode surface, all the particles formed react immediately with the electrode. On the other hand, the amount of particles formed per unit time in the adsorbed monomolecular layer is much smaller than that in the volume of the solution so that the assumption that the reaction proceeds in the adsorbed state would not explain the observed phenomena. Hence a further assumption has to be made, namely, that the reaction proceeds by a quite different rate, being catalysed by the adsorption at the surface of the electrode. Such catalysis of reactions of complexes has been observed in many cases (for review see ref. 3), the catalyst being charcoal, silica gel, mercury, Raney nickel, etc. The reaction which leads to the appearance of the positive wave is of a similar nature. It is a substitution reaction catalysed by the adsorption at the surface of the electrode.

The polarographic method can thus be used for the study of the ability of various complexes to undergo these heterogeneous substitutions, the relative height of the first wave being a measure of the rate constant of the reaction. For a series of complexes $[Co(NH_3)_5X]$ the following order of the reaction rates with Br^- ions in 0·1 *M* $HClO_4$, 0·9 *M* $NaClO_4$, 5×10^{-3} *M* NaBr solution has been deduced, X being:

$$NO_2^- < NH_3 \approx F^- < Ox^{=} \approx (ONO)^- < CH_3COO^- < H_2O < NO_3^- \qquad (2)$$

The adsorption catalysis is probably due to the strong polarization of the complex owing to the formation of a bond with the catalyst and to the influence of the electric field in the interface between the catalyst and the solution. The activation energy of a process is much decreased by such a polarization, the complex being much more reactive in the adsorbed state. This mechanism is identical with that which is supposed to operate in the electrode reactions[4], as can be seen also by the close parallelism between the rate of the catalysed substitution reactions and the rate of the electrode reactions; the order of the latter being in 1 *M* $NaHSO_4$ (ref. 4 and Vlček, A. A., unpublished results):

$$NH_3 < F^- < Ox^{=} < (ONO)^-, NO_2^- < CH_3COOH < H_2O < NO_3^- \qquad (3)$$

With the exception of the complex with nitrite, the two series are almost identical.

This close parallelism suggests that the structural changes of the reacting complexes, that is, the configuration of the activated complex, are very similar in both cases. For the electrode reaction it has been found[4] that, with the exception of the complex $[Co(NH_3)_5NO_2]^{2+}$ (Vlček, A. A., unpublished results), the complexes are orientated in such a way that the atomic group X is as distant as possible from the electrode surface. This orientation is also very convenient for the substitution reaction, the heterogroup being accessible for the exchange with other reactants without any bond breaking and rearrangement of the complex.

The proof of substitution reactions catalysed by adsorption at the electrode surface is very important for the interpretation of many observations concerning the influence of anions on the electrochemical behaviour of complexes. The presence of many anions causes a great shift of the reduction wave of some complexes towards positive potentials. This shift may be due to a substitution reaction of the type here described, which, when rapid, causes the reduction of the total amount of the depolarizer to take place at positive potentials.

The experimental details and further discussion will be published elsewhere.

Microwave Spectrum of Fluorine Cyanide

A fraction of the product of fluorination of cyanogen, in which fluorine cyanide was detected by infra-red spectroscopy[1], has now been shown to absorb in the microwave regions of 21,000, 42,000 and 63,000 Mc./s. The absorptions occur in the frequency-ranges expected from the resolved rotational structure of the infra-red band, ν_3, centred on 1,077 $cm.^{-1}$. Their Stark effects and nuclear quadrupole splittings are those expected for $J = 0 \rightarrow 1$, $1 \rightarrow 2$ and $2 \rightarrow 3$ transitions in the linear molecule, $FC^{14}N$. Spectra due to molecules with one quantum of vibrational energy in the degenerate bending mode (ν_2) have also been measured.

Values so far obtained are the rotational constant, $B_0 = 10{,}554{\cdot}20 \pm 0{\cdot}01$ Mc./s.; the coupling constant for $^{14}N = -2{\cdot}67 \pm 0{\cdot}05$ Mc./s.; the dipole moment, $\mu = 1{\cdot}68 \pm 0{\cdot}05\ D$; and the centrifugal stretching constant, $D_J = 0{\cdot}0053 \pm 0\ 0003$ Mc /s. The quadrupole coupling suggests a C—N distance slightly more than 1·163 A. found[2] in ClCN: if 1·165 A. is assumed, the C—F distance is obtained as 1·260 A. This is the shortest C—F distance known, and implies, in agreement with the low value of the coupling constant, an important contribution of $^{+}F{=}C{=}N^{-}$ to the structure.

We are at present attempting to improve the yield and the purity of the sample. It should then be possible to detect other isotopic species in natural abundance (particularly $FC^{15}N$). We hope to be able to detect and resolve other infra-red bands to see if the small discrepancy between the microwave and the infra-red (parallel mode) B-values extends to infra-red values obtained from perpendicular modes.

Thiol Exchange System with Thiolbenzoic Acid

Although many methods for the preparation of thiolacetic acid have been reported[1], all rely on the use of hydrogen sulphide, preferably under pressure, or phosphorous pentasulphide, which is not pleasant to handle.

It occurred to us that if an equilibrium existed between thiolbenzoic acid and thiolacetic acid:

$$C_6H_5COSH + CH_3COOH \rightleftharpoons C_6H_5COOH + CH_3COSH$$

the reaction might be persuaded to go towards completion by removal of the latter as the lowest-boiling component.

We have, in fact, obtained thiolacetic acid in yields of 95 per cent, based on the thiolbenzoic acid used, by this exchange method which we believe to be novel. Catalytic amounts of water appear to be essential; the most satisfactory method is to reflux glacial acetic acid (2 mol.) under a packed column fitted with reflux head, then gradually (8–12 hr.) add to the still, thiolbenzoic acid (1 mol.) previously saturated by shaking with water. The head temperature falls to 87–89° C. and the thiolacetic acid is withdrawn at such a rate that this temperature is maintained. The product needs drying for storage.

As thiolbenzoic acid is now commercially available the method should be attractive to those wishing to prepare conveniently relatively small quantities of thiolacetic acid.

Thiolpropionic acid was prepared by the same method, but attempts to convert butyl alcohol to butyl mercaptan were unsuccessful.

RADIOCHEMISTRY

An Alternative Mechanism for Chemical Protection against Radiation Damage

Studies of the effects of chemicals in decreasing the radiation damage suffered by exposed organisms have revealed a number of compounds which are quite efficient in this respect[1-3]. While several mechanisms have been suggested for their mode of action[4], none has been universally accepted. It seems possible that the protective action may function through several alternative routes. It is the purpose of this communication to show another possible mode of action of these agents and some of the evidence which supports it. The mode of protection cited here need not be an exclusive one.

Almost all the best protective agents have structures characteristic of good chelating agents. The general structures of many of these agents can be written as $X—CH_2—CH_2—Y$ or $X—CH_2—CH_2—CH_2—Y$, where X and Y are groups capable of co-ordinating with one or more of the co-ordination sites of a metal ion. Thus these are compounds which can readily form five- or six-membered rings upon chelation. Typical examples of such compounds are β-mercaptoethylamine, glutathione, 2,2′-dithioethanol, 3-mercaptopropylamine and S,2-aminoethyl*iso*thiourea. It is suggested that their effectiveness has the following basis. In the course of radiation some of the transition metal constituents of the organism are ejected from their normal sites by the radiation. These are then more or less free to enter the circulation and do so in an amount sufficiently large to poison many of the metal ion-inhibited enzymes such as adenosine triphosphatase, carbonic anhydrase, arginase, etc.[5]. In the presence of the protective agent the 'outlaw' metal ions are tied up in the form of chelates which are more stable than the complexes formed with the enzyme. Thus no inhibition of such enzymatic processes can occur. Since many such inhibition processes are irreversible, the ineffectiveness of administering the protective agent after irradiation is explicable.

If such is the case, a correlation between the stability of the resulting chelate and the effectiveness of the protection furnished would be expected. Unfortunately, quantitative studies of both stability constants and survival rates are available on only a few compounds. For the compounds β-mercaptoethylamine, cystein, histamine, ethylenediamine tetraacetic acid, ethylenediamine, salicylic acid, and glycine such data are available. The correlation coefficient between the percentage survival[1-3] and the $\log_{10}$ of the stability constants of the copper chelates[6] is 0·57. For a perfect correlation this would be 1·0 and for no correlation it would be 0.

If this mechanism is actually responsible for a considerable part of the protective action, it would suggest that the best protection would be afforded by compounds capable of tying up several of the co-ordination positions of a metal ion and thus use the chelate effect to enhance the protective action. The same substances which provide chemical protection should also provide protection against heavy-metal poisoning when injected before the heavy-metal. Furthermore, a wider class of materials should be capable of protective action than would be estimated on the basis of other theories of this action, such as that of mixed disulphide formation[7]. The requirements of a good protective agent appear to be very similar to those of a good chelating agent with some specificity for transition metals, especially copper. If this chelating action is important, the protective action found for ethylenediamine tetraacetic acid[3,8] should be found in enhanced measure with compounds such as 1,2-diamino*cyclo*hexane N,N,N′,N′-tetraacetic acid and diethylenetriaminepentaacetic acid.

An alternative explanation with somewhat similar consequences is one in which the catalytic effectiveness of the resulting chelate complexes in decomposing hydroxylonium or hydrogen peroxide is the basis of their action. This explanation could perhaps be reconciled with the theory of competition for hydroxylonium radicals of Bacq *et al.*[1,3].

Bacq and his co-workers briefly considered the possible importance of chelation but then dismissed it. Their chief evidence against it was obtained not on organisms but on polymethacrylic acid solutions, where the action of radiation is presumably analogous to that found with organisms. It seems very likely that the behaviour of organisms is considerably more complex. It is highly possible that there are two or more major types of radiation damage the cumulative effect of which is lethal. The control or elimination of one of these types may then reduce the cumulative damage to a level which is not lethal.

BIOCHEMISTRY

Incorporation of α,ω-Dicarboxylic Acids as Side-chains into the Penicillin Molecule

WHILE a considerable number of biosynthetic penicillins have been obtained by adding different side-chain precursors to the culture medium, the incorporation of aliphatic dicarboxylic acids into the penicillin molecule does not as yet seem to have been reported.

When a high-yielding *Penicillium chrysogenum* strain of the Wisconsin family (*Wis* 51.20 [1], subculture *c* isolated in this laboratory) was grown in shake flasks on a corn-steep lactose medium in the absence of a precursor acid (for conditions of growth see footnote of Table 1), the culture medium showed a slight activity against *Bacillus subtilis* (40–150 benzylpenicillin units per ml.) and a slightly higher activity (about 300 units per ml., benzylpenicillin as standard) against *Klebsiella pneumoniae*. Addition of the lower homologues of α,ω-dicarboxylic acids gave essentially similar results ; but on addition of adipic acid or the higher homologues the antibacterial activity against *K. pneumoniae* considerably increased while that against *B. subtilis* was slightly decreased (Table 1).

The highest increases of anti-*Klebsiella* titres (up to ten-fold) were obtained on addition of adipic, pimelic and azelaic acid ; the higher homologues gave somewhat lower titres. Similar results were obtained on a synthetic medium of the type developed by Jarvis and Johnson[2].

The penicillin formed after addition of adipic acid as side-chain precursor was isolated from larger quantities of culture media in purified form and

Conditions of growth: Culture medium—lactose 3 per cent, glucose 0·5 per cent, corn-steep liquor 4 per cent, calcium carbonate 1 per cent, seeded with 10 per cent of a 48-hr.-old mycelial suspension grown on a corn-steep liquor (8 per cent) – dextrin (6 per cent) medium, *p*H adjusted to 5 4 with sodium hydroxide, from a suspension of conidia developed on barley moistened with the sporulating solution of Whiffen and Savage (ref. 4). 500-ml. Erlenmeyer shake flasks with 60 ml. of culture media were agitated at 25° C. on a rotary shaker (ref. 9), sulphite aeration rate 35 ml. oxygen per 100 ml. fluid per hr.

* Averages of two shake flasks which gave results in very good agreement with each other.

† The figures are benzylpenicillin units giving inhibition zones equal to those given by the undiluted broth.

‡ Added in two lots of 1–4 ml. each (according to the solubility), at 24 hr. and 72 hr., of an aqueous solution of the sodium or potassium salts in concentrations to give the above final concentration values

shown to be (4-carboxy-*n*-butyl)-penicillin, that is, to contain the adipic acid side-chain.

The mycelium was grown at 28° C. in fermentors of 90 l. capacity[3] containing 50 l. of a culture medium consisting of 4 per cent corn-steep liquor, 3 per cent lactose, 0·5 per cent glucose and 1 per cent calcium carbonate. (Conditions of aeration and agitation: sparger aeration in fully baffled system, propeller blade 130 mm. diameter rotating at 420 r.p.m., air flow 50 l. per min. during first 24 hr., then increased to 80 l., overpressure 1 atm. One portion of 50 ml. of vegetable (mainly soy bean) antifoam oil containing 4 per cent 'Alkaterge', added at the beginning, and further portions of 50 ml. during the fermentation if and when required.) The culture medium was seeded with 10 per cent of a 48-hr.-old mycelial suspension grown in another 90-l. fermentor under the same conditions of aeration in a medium containing 6 per cent dextrin, and 8 per cent corn-steep liquor, *p*H adjusted to 5·4 with sodium hydroxide. The seed medium was inoculated with a suspension of conidia, developed on barley moistened with the sporulating solution of Whiffen and Savage[4].

Adipic acid in the form of its sodium salt was added in a 25 per cent aqueous solution in two lots of 800 ml., one at 24 hr. and the second at 72 hr., to give a final concentration of 0·4 per cent after each addition, that is, a total of 0·8 per cent. The fermentation was allowed to proceed for 96–120 hr., after which time the titre against *K. pneumoniae* had reached about 1,500 benzylpenicillin units/ml., while the titre against *B. subtilis* was about 150 units/ml. The filtered culture medium was percolated through a column of granular charcoal (20–60 mesh, *BO* grade, Farnell Carbons, Ltd., London) prepared as described by Abraham, Newton and Hale[5]. 1 vol. of charcoal was used for 2 vol. of medium. After washing with 1/10 vol. of water and then 1 vol. of 20 per cent acetone, the active substance was eluted with 2 vol. of 70 per cent acetone. The eluate containing about 70 per cent of the active substance with a specific activity of about 80 hydroxylamine units/mgm. using the method of Ford[6] for the determination of penicillin (the value of the pure compound is 1,500 units/mgm.) was concentrated about 20 times *in vacuo* in a climbing film still[7] at a temperature not above 40° C., and then lyophilized. There was a loss of activity of about 20 per cent in this process. The dry material from the lyophilization was extracted 3 times with 4 ml. of methanol for each gram of dry substance. 2 vol. of acetone were added to the methanolic solution and the mixture was centrifuged to eliminate precipitated material of low activity. The supernatant was concentrated to a small volume and 10 vol. of acetone were added to this. The supernatant contained a mixture of penicillins (about 40 per cent of the total activity) with a ratio of activity against *K. pneumoniae*/activity against *B. subtilis*, similar to that of benzylpenicillin, while the precipitate contained the remainder of the active substance with a much higher activity ratio and a specific activity of 300–350 hydroxylamine units per mgm. The precipitate dissolved in water was passed through a column of 'Dowex' 1 × 8, 50–100 mesh, in the chloride form. 1 ml. of resin was used for about 10,000 hydroxylamine units of active substance. The activity was eluted with 5 per cent sodium chloride at *p*H 7. The active fractions were lyophilized, and the dry product was extracted with three portions of 100 ml. of dry ethanol. The addition of 4 vol. of acetone to the ethanolic solution precipitated a product which was dried with acetone and ether.

The yield from the ion-exchange chromatography and the successive operations was about 50–60 per cent and the final product was 70–80 per cent pure. The active product was rapidly destroyed by penicillinase. It could not be extracted by any organic solvents at an acid *p*H. In paper chromatography on Whatman No. 1 at 5° C., in *n*-butanol/ethanol/water, 40 : 10 : 50 v/v/v, it remained at the origin; in 70 per cent aqueous *n*-propanol it had an $R_F = 0{\cdot}35$ while benzylpenicillin had an R_F of 0·75. On paper electrophoresis (0·1 *M* phosphate buffer, *p*H 6·8, applied potential 25 V./cm.) it had a mobility about twice (20 cm. per hr.) that of benzylpenicillin (10·5 cm. per hr.). After hydrolysis for 2 hr. at 100° C. in 2·5 *N* hydrochloric acid, subsequent ether extraction and evaporation of the ether extracts, crystals appeared in a yield of 60 per cent of the theoretical

Table 2. COMPARISON OF ANTIBACTERIAL PROPERTIES OF BENZYLPENICILLIN AND (4-CARBOXY-*n*-BUTYL)-PENICILLIN*

* Serial broth dilution technique: 0·1 ml. of a 1 : 80 dilution of a 24-hr. broth culture of the respective bacteria was inoculated into 9 9 ml. broth of the following composition—meat extract 1 0 per cent, sodium chloride 0 5 per cent, peptone 1·0 per cent, glucose 0·05 per cent.

† Corrected for impurities.

amount expected, which were identified as adipic acid by melting and mixed melting point as well as by their paper chromatographic behaviour in two solvents (ethanol/conc. ammonia/water, 80 : 4 : 16, v/v/v, and *n*-butanol/acetic acid/water, 40 : 10 : 50, v/v/v).

A comparison of the minimal growth-inhibiting concentrations of (4-carboxy-*n*-butyl)-penicillin and benzylpenicillin against a range of different Gram-positive and Gram-negative bacteria is given in Table 2. From the results it is clear that (4-carboxy-*n*-butyl)-penicillin is very similar in its activity to cephalosporin *N* as reported by Heatley and Florey[8], that is, it has a much lower activity than benzylpenicillin against the Gram-positive and about the same order of activity against the Gram-negative bacteria. The lowering of the activity against Gram-positive bacteria is therefore not a specific effect of the α-amino group in the α-aminoadipic side-chain, present in cephalosporin *N*, but can be obtained by the introduction of the simple adipic acid side-chain or its higher homologues into the penicillin molecule, that is, by the presence of an extra free carboxylic group. A *K. pneumoniae* strain made resistant to benzylpenicillin by subculturing in the presence of subminimal inhibitory concentrations of benzylpenicillin (it grew eventually in 6,000 units per ml.) was also found to be resistant to (4-carboxy-*n*-butyl)-penicillin. Skin tests of (4-carboxy-*n*-butyl)-penicillin in seven highly benzylpenicillin-allergic subjects (carried out by Drs. R. Maffei and E. Errigo of the University of Rome) have shown that the compound does not elicit allergic reactions.

Effect of Cardiac Glycosides and Inorganic Ions on Binding of Serotonin by Platelets

THE presence of high concentrations of serotonin (5-hydroxytryptamine) in blood platelets has stimulated many studies on the mechanism of the uptake of the amine by these cells[1-5]. This process can readily be studied *in vitro* employing platelets suspended in plasma or in saline solutions, and there is now considerable evidence that this process is one of active transport[6].

A previous study from this laboratory[7] employing platelets suspended in isotonic sodium chloride indicated that inorganic phosphate is required in order to obtain maximum binding of 5-hydroxytryptamine. This communication presents a more detailed study of the factors affecting the binding of 5-hydroxytryptamine by blood platelets in well-defined media. By controlling the *p*H, it appears that the active transport mechanism can be studied independently of other mechanisms that may be functioning. In such a system inorganic phosphate and potassium are required for maximal uptake. The cardiac glycosides are known to inhibit the active transport of cations by several tissues[8] as well as the uptake of iodide by isolated thyroid slices[9], and it seemed of interest to test their ability to inhibit the transport of other substances. Both the cardiac glycosides and reserpine, which has previously been shown to inhibit the uptake of 5-hydroxytryptamine by platelets[4], inhibited this system.

Human platelets were isolated according to the method of Dillard *et al.*[10], washed as described previously[7] and resuspended in saline. When platelets were incubated with 5-hydroxytryptamine the concentration of the latter in the platelets continued to increase for approximately 90 min. Incubations were carried out for 1 hr. at 37° C., during which time uptake was nearly linear. The platelets were re-isolated, washed and assayed for both protein[11] and 5-hydroxytryptamine[12]. Results are expressed as μgm. of 5-hydroxytryptamine per mgm. of platelet protein.

A marked effect of *p*H on the relationship between the uptake of 5-hydroxytryptamine and its concentration in the medium was observed. At *p*H 5·7 with potassium and phosphate present (Fig. 1) the system became saturated at low concentrations of amine (less than 5 μgm./ml.). At higher *p*H, however, another mechanism appeared, involving a more nearly linear dependence of 5-hydroxytryptamine accumula-

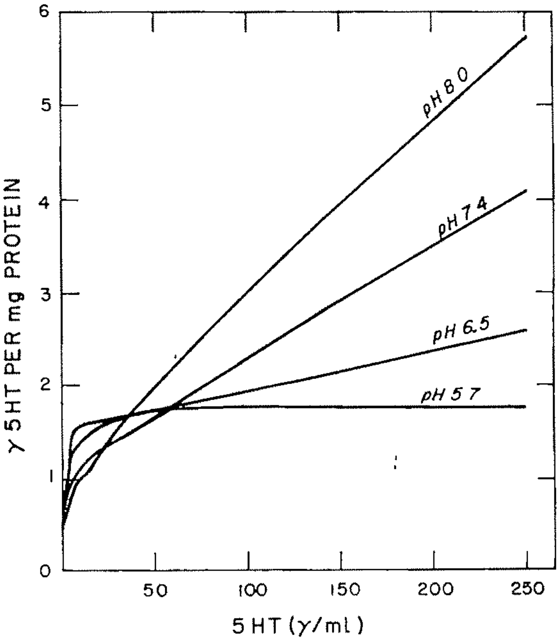

Fig. 1. The effect of *p*H and 5-hydroxytryptamine concentration on platelet uptake of the latter. The incubation mixture contained 1 ml. of platelet suspension (about 1 mgm. protein) in 0·9 per cent sodium chloride, 5-hydroxytryptamine (dissolved in 0·9 per cent sodium chloride and adjusted to *p*H 5·7), 50 μmoles phosphate buffered at the appropriate *p*H, and 0·9 per cent sodium chloride to make up to a final volume of 2 ml.

B Platelet + 5HT + PO_4^{3-} (50 μmoles)	0 22	0 40	0·51	0·34	46
C Platelet + 5HT + K^+ (50 μmoles)	0·43	0 49	0 76	0 48	68

* Values are those over a control in which platelets were incubated only with 5HT (30 μgm) and 0 9 per cent sodium chloride to make up to a final volume of 2 ml

The incubations contained 1 ml. of platelet suspension in 0·9 per cent sodium chloride (about 1 mgm. protein), 30 μgm. 5HT (0·3 ml.) in 0 9 per cent sodium chloride and 0·9 per cent sodium chloride to make up to a final volume of 2 ml. 0 1 ml. of the following solutions was added System *A*, phosphate buffer pH 5·7 (0 5 *M* with respect to phosphate containing 450 μmoles/ml. of K^+ and 90 μmoles/ml. Na^+). System *B*, 0 5 *M* sodium dihydrogen phosphate (adjusted to pH 5·7). System *C*, 0 5 *M* potassium chloride.

5HT = 5-hydroxytryptamine.

tion on the amine concentration. This relationship between uptake and concentration suggests that a diffusion mechanism predominates at the higher pH value.

Platelets suspended in saline alone, at pH 5·7, were able to bind exogenous 5-hydroxytryptamine. However, the uptake was much greater when potassium and phosphate were added. As shown in Table 1 both phosphate and potassium were required for optimal uptake. Of the total attainable stimulation of 5-hydroxytryptamine uptake approximately 45 per cent could be produced by addition of phosphate alone and 70 per cent by potassium alone. Maximal effects were obtained with as little as 10 μmoles potassium and 1 μmole phosphate.

As shown in Table 2 both reserpine and oubain inhibited the uptake of 5-hydroxytryptamine in this system. However, the inhibition observed was only on the potassium and phosphate effects. The uptake of 5-hydroxytryptamine which occurred when the platelets were suspended in saline alone (usually a 2–3 fold increase over the control) was not affected by these drugs. The cardiac glycosides used routinely were oubain, digitoxin and strophanthin potassium, all of which had equal activity at 10^{-5} *M*. None of the glycosides inhibited at 10^{-7} *M*.

Table 2. EFFECT OF COMPOUNDS ON PLATELET UPTAKE OF 5-HYDROXY TRYPTAMINE AT pH 5 7
(Increase in μgm. of 5HT per mgm. of platelet protein over endogenous*

System	Experiment No. 1	2	3	4	5	6
A Platelet + 5HT	0 58	0·97	0 74	0 52	0·84	0 53
B Platelet + 5HT + K^+ + PO_4^{3-}	0·96	1·36	1·22	1·03	1·09	1·62
C Platelet + 5HT + K^+ + PO_4^{3-} + oubain	0·65	1 12	0·91	0·46	0 78	0 87
D Platelet + 5HT + K^+ + PO_4^{3-} + reserpine	0 53	1·08	—	0 52	0 70	0 60
E Platelet + 5HT + oubain	0·64	1·18	0 78	—	0·84	0 61
F Platelet + 5HT + reserpine	0 69	1 10	0·63	—	0·92	0 42

*The endogenous values in the experiments to be described in this report varied generally between 0 1–0·4 μgm. 5HT per mgm. of platelet protein.

Each incubation mixture contained 1 ml. of platelet suspension (about 1 mgm. of protein) and 30 μgm. of 5HT (0·3 ml). 50 μmoles of phosphate, 45 μmoles of K^+, oubain (10^{-4} *M* final concentration), and reserpine (10^{-5} *M* final concentration) were added where indicated. The final volume was made up to 2 ml. with 0 9 per cent sodium chloride.

5HT = 5-hydroxytryptamine.

Unlike the seroids and reserpine, 10^{-3} *M* fluoride inhibited almost completely the uptake of 5-hydroxytryptamine whether or not potassium and phosphate were present. Since the uptake of 5-hydroxytryptamine by the platelets proceeds under anaerobic conditions and is not inhibited by 2,4-dinitrophenol, it has been suggested that glycolysis supplies the energy required for this process. The inhibition observed with fluoride supports this postulate. The mechanism of inhibition by the glycosides remains unclear. However, in mammalian erythrocytes, which presumably derive energy for the transport of cations from glycolysis, the cardiac glycosides are also effective inhibitors of the transport of sodium and potassium[13] but do not affect the synthesis of adenosine triphosphate or the metabolism of the phosphorylated intermediates in glycolysis[14,15].

It is of interest that under more alkaline conditions (pH 8) where a diffusion type mechanism appears to predominate, reserpine, the cardiac glycosides and fluoride had much less effect on the accumulation of 5-hydroxytryptamine by platelets.

We wish to thank Dr. Sidney Udenfriend, for his useful suggestions, and Dr. Richard Crout, who collected the blood for these experiments.

Effect of Streptomycin on the Incorporation of Tyrosine labelled with Carbon-14 into Protein of *Mycobacterium* Cell Fractions *in vivo*

STREPTOMYCIN inhibits the incorporation of tyrosine labelled with carbon-14 into the protein of a cell-free system isolated from *Mycobacterium friburgensis*, but the degree of inhibition is less when intact cells are incubated in a culture medium[1].

We assume that streptomycin does not inhibit the incorporation into the protein of all cell fractions, and investigated, therefore, the rate of labelling of whole cell protein and various cell fractions on incubation of intact cells with labelled tyrosine.

The bacteria were washed and resuspended in a Sauton medium at a concentration of 200 mgm. wet

Table 1. EFFECT OF STREPTOMYCIN ON THE INCORPORATION OF LABELLED TYROSINE INTO PROTEIN OF *Mycobacterium friburgensis* CELL FRACTIONS *in vivo*

Experiment No.	Incubation time (min.)	c.p.m./mgm. protein							
		Whole cells		Fraction *A*		Fraction *B*		Fraction *C*	
		–	+ Streptomycin	–	+ Streptomycin	–	+ Streptomycin	–	+ Streptomycin
1	30	219	165	132	128	192	134	214	102
2	10	122	68	65	65	12	8	126	31
2	30	150	80	112	122	35	15	139	60
3	10	126	55	26	29	55	9	27	8

weight per ml. 5 ml. cell suspension were incubated for 30 min. with shaking at 37° C. in the presence of 5 μc./ml. labelled DL-tyrosine (1 μc. = 17 × 10^6 c.p.m.) with or without addition of 100 μgm./ml. streptomycin. The cells were washed twice with 20 vol. of ice-cold distilled water, and resuspended in 6 ml. buffer[2]. 1 ml. was removed to determine incorporation into total cell protein, to the remaining 5 ml. cell suspension 0·8 gm. alumina was added, and the cells were disintegrated by grinding in a chilled mortar for 20 min. The suspension was centrifuged at 1,200*g* for 10 min. (the sediment-fraction *A*). The supernatant was centrifuged in a Spinco preparative centrifuge at 105,000*g* for 60 min. to yield a particle fraction (*B*) and a clear supernatant (*C*).

The protein of the whole cells and of the fractions *A*, *B* and *C* was isolated and the radioactivity determined. The results of the experiments are shown (Table 1).

They show that the extent of inhibition differs markedly in the fractions, being greatest in the fraction *C* (which corresponds to our 'cell-free' system)[1], while no inhibition was found in fraction *A* (cell wall and membrane fragments).

These results suggest that streptomycin does not inhibit the protein synthesis of the cell wall.

Peptides obtained from Partial Hydrolysis of Decalcified Human Dentin Collagen

FROM *in vitro* studies of mineralizing connective tissues, it has been suggested that the arrangement of polarized protein macromolecules in the submicroscopic collagen fibrils may be an important factor in determining whether suitable 'nucleation centres' for hydroxyapatite crystals will be present[1]. The banded regions of natural and reconstituted collagens are thought to contain relatively high proportions of the bulky basic and acidic amino-acid residues, thus suggesting that the amino-acid residues in collagen are not randomly distributed. This view has already been verified for soft tissue procollagen by an analysis of peptides obtained by enzymatic hydrolysis[2]. Since soft and hard tissue collagens differ markedly from each other with respect to the availability of their ε-amino-groups to dinitrofluorobenzene[3], as well as in their solubility behaviour[1] and internal molecular structure[4], it is of interest to compare the composition, amino-acid sequence and structure of highly polar peptides obtained from both types of collagen.

Small pieces of dentin from the roots of freshly extracted adult human anterior teeth were demineralized by soaking in 1 *N* hydrochloric acid for 24 hr. at 4° C. The demineralized dentin collagen was washed with cold 0·16 *N* potassium chloride solution for 24 hr., rinsed with distilled water, and allowed to dry in air. Weighed samples (0·1 gm.) were heated in distilled water (20 ml.) in a sealed tube at 110° C. for 16 hr. The resulting hydrolysate was evaporated to small volume on a steam bath, and then separated into 4 ninhydrin-positive bands labelled *A*, *B*, *C* and *D*, by low-voltage electrophoresis for 2 hr. on Whatman No. 1 filter paper using 1·2 *N* acetic acid as solvent. Migration occurred towards the cathode. The positions of the amino-acids and peptide spots were visualized by spraying the dried chromatograms with 0·1 per cent ninhydrin in acetone, and heating at 105° C. for 2 min. Each band was eluted with 6 *N* hydrochloric acid (redistilled over stannic chloride), and hydrolysed for 16 hr. in a sealed tube at 105° C. Portions of the hydrolysate, as well as the mixture before acid hydrolysis, were examined by two systems of paper chromatography, employing butanol/acetic acid/water (4 : 1 : 5) and phenol/water (7 : 3) as solvents.

It was observed that the main products of the water hydrolysis of dentin collagen were peptides *A*, *B*, *C* and *D* together with minimal amounts of free amino-acids. The peptides *A*, *B*, *C* and *D*, labelled in order of increasing mobility towards the cathode, differed markedly from each other in their qualitative amino-acid composition. Band *B* was typical of the composition of the intact protein, all the amino-acids normally found in mammalian collagen being present. Band *A* resembled band *B*, except that hydroxyproline was absent. In band *C*, hydroxyproline, proline and phenylalanine were all absent. Band *D* contained 7 amino-acids—lysine, hydroxylysine, glycine, alanine, arginine, glutamic and aspartic acids. This highly polar band was further investigated and found to be homogeneous in the chromatographic systems used, and on electrophoresis at different *p*H values. By means of Sanger's dinitrofluorobenzene technique[5] it was shown that alanine was in the N-terminal position of the intact peptide *D*. Under the experimental conditions cited, the results were reproducible.

These preliminary results show that the distribution of amino-acids in dentin collagen is non-random and resembles to some extent that found in soft tissue procollagen[2]. The amino-acid sequence of the peptides, as well as their relative efficiency as 'seeding' agents for hydroxyapatite crystals, are currently being investigated, and the results will be reported at a later date.

Inactivation of Erythropoietin by Neuraminidase and by Mild Substitution Reactions

ERYTHROPOIETIC activity in the plasma of rabbits made anæmic with phenylhydrazine is associated with mucoproteins[1–4]. It has been shown that the activity is destroyed by proteolytic enzymes[1,3,5]. Rambach *et al.*[6] have found as well as us that heating at 100°, *p*H 2, for 1 hr. destroys the activity, a treatment which, in the case of guinea pig α_1-acid glycoprotein[7], selectively removed sialic acid. In spite of the mildness of this treatment it is possible that other bonds (sugar, amino-acid) were broken. We have now been able to show that exposure to neuraminidase[8] completely inactivates the mucoprotein.

An acid glycoprotein (15·6 per cent sialic acid) has been regarded as erythropoietin by Rambach *et al.* We[2] have pointed out that it is probable that only a small proportion of the concentrates yet prepared is the active erythropoietic material. Recent work by Campbell *et al.*[11,12] with sheep plasma has strengthened this conclusion. Their most active preparation is lower in sialic acid.

The cold, neutralized filtrate from heat-coagulated anæmic rabbit plasma[3] is mixed with 1·5 vol. of absolute ethanol and allowed to stand at 5° overnight. The inactive precipitate is removed by centrifugation in the cold and the supernatant mixed with an equal volume of absolute ethanol. After standing overnight, the precipitate is collected in the cold and dried in a desiccator. It is extracted with 20 parts of 0·01 *M* sodium acetate, *p*H 4·8, and the soluble portion (about 85 per cent) is dialysed against distilled water. The dialysand is lyophilized. 60–120 mgm. of a very soluble white powder are obtained from 1 litre of plasma. We will refer to this preparation as *LD*.

When *LD* is applied to a column of 'DEAE' cellulose (1 gm.) equilibrated in 0·01 *M* sodium acetate, *p*H 4·8, 15–30 per cent of protein emerges as a front, 10–20 per cent as another peak with 0·05 *M* sodium chloride as eluant. Both are erythropoietically inactive. Elution with 0·1 *M* sodium chloride yields a peak containing all the activity and 50–60 per cent of the protein. It again gives a single peak when rechromatographed on a similar column. Its properties are listed in Table 1.

A potent human urinary ultrafiltration residue[9], a gift of Dr. Van Dyke, was applied to a 'DEAE' column as above. 0·25 *M* sodium chloride had to be used for elution of the activity. Paper electrophoresis at *p*H 8·6 and 4·5 showed it to be similar to *LD* (mobility like an acid α_1 protein). Similar behaviour is shown by erythropoietin obtained from unboiled sheep plasma before its final purification[11,12].

Table 1

	Buffer	*p*H	Ionic strength	Mobility $\times 10^5$ cm.^{2} volt sec.
Moving boundary electrophoresis.	Sodium barbiturate	8 75	0·1	– 5 40
	Sodium acetate	4·25	0 1	– 2·92
	Glycine hydrochloride	2·34	0·1	+ 0·79
Isoelectric point		2·75		
E(1 per cent, 1 cm) 280 mμ		7·0		
Protein bound hexose (orcinol)		9 4%		
Hexosamine (Elson-Morgan, Rimington)		9 0%		
Sialic acid (resorcinol hydrochloride, Svennerholm (ref. 17) 15 min., 100° C)		13–14%		
Methyl pentose		0 66–0·80%		

Neuraminidase treatment. (*a*) 15 mgm. *LD* in 2·4 ml. 0·05 *M* calcium acetate, *p*H 6, were incubated with about 30,000 units of neuraminidase[8] at 35°. After 1 hr., 0·1 ml. of 1 *M* sodium citrate and 10 ml. water were added, and the mixture boiled for 5 min. It was erythropoietically inactive. No loss of activity was found in a control experiment without enzyme added. (*b*) In similar experiments the reaction was stopped by sodium citrate alone without boiling after 10 min. and 1 hr. respectively, and each reaction mixture was then dialysed against 10 vol. of water. In both cases practically all the sialic acid of *LD* was found in the dialysate, and both dialysates and dialysands were erythropoietically inactive. Peptide bond hydrolysis (increase in amino-nitrogen) was insignificant and probably did not occur.

A number of relatively mild substitution reactions were carried out with *LD* :

(1) *Iodination* (ref. 13). To 10 mgm. *LD* in 0·4 ml. 0·35 *M* sodium phosphate *p*H 7·6, increments of 0·1 *N* iodine were added at room temperature. 0·07–0·13 ml. were taken up in 3½ hr.

(2) *Acetylation* (ref. 14). To 10 mgm. *LD* in 0·2 ml. of a solution of 11·9 gm. sodium acetate in 20 ml. water (*p*H = 9·25) 0·03 ml. of acetic anhydride was added over a period of 1 hr. at 0°.

(3) *Formaldehyde* (ref. 15). 10 mgm. *LD* in 0·1 ml. 0·35 *M* sodium phosphate *p*H 7·6 and 0·01 ml. 40 per cent formaldehyde were allowed to stand for 20 hr. at 8°. Excess formaldehyde removed *in vacuo*.

(4) *Esterification* (ref. 16). To 10 mgm. *LD* in 0·4 ml. methanol at –15° 0·02 ml. of thionylchloride were added over 3 hr. Methanol was removed *in vacuo*.

All four of the above reaction mixtures were erythropoietically inactive. (Assayed by iron-59 uptake in fasted rats[3,18].)

The enzymatic loss of erythropoietic activity indicates that bound sialic acid is an essential part of the molecule. It remains to be seen whether the high sensitivity of the molecule to substitution reactions carried out under conditions too mild for hydrolysis is related only to the sialic acid moiety or other sugar or amino-acid constituents of the active mucoprotein.

These studies were supported by a grant of the American Cancer Society.

We are grateful to Dr. G. L. Ada for a gift of neuraminidase and helpful suggestions.

Co-factors in *Hevea brasiliensis* Latex Serum

IT has recently been shown[1] that the incorporation of mevalonic acid into rubber by an enzyme system in *Hevea* latex *in vitro* is not dependent on the addition of such co-factors as are known to be necessary for the incorporation of mevalonic acid into squalene. Such co-factors include adenosine triphosphate, cysteine and/or glutathione in the case of cell-free preparation of rat liver[2], although Amdur, Rilling and Bloch[3] found that whereas adenosine triphosphate was necessary with a soluble extract of bakers' yeast, no reducing agent requirement was demonstrated. Popjak and Gore show that under anaerobic conditions the reducing agent is not necessary but it is essential for the formation of squalene aerobically. Tchen[4] has demonstrated that the purified enzyme 'mevalonic acid-kinase' responsible for part of the pathway, namely, the phosphorylation of mevalonic acid, requires the presence of any of the four nucleoside triphosphates (including cytidine triphosphate). He shows also that the enzyme is inhibited by chloromercuribenzoate.

The present communication is to record the detection and assay of di- and tri-phosphates of adenosine and cytidine and of cysteine and reduced glutathione in samples of freeze-dried fresh latex sera obtained from Malaya. This material[5] would be expected to be equivalent to the serum from fresh latex 1–2 hr. after tapping, so far as soluble co-enzyme content is concerned. Details of these investigations will be published elsewhere; but it is thought of interest to record that such samples of normal latex sera examined contain approximately 0·7 micromole of glutathione and 0·4 micromole of cysteine per ml. and at least 0·0005 per cent nucleoside diphosphate in the form of adenosine diphosphate and cytidine diphosphate (predominantly as adenosine diphosphate), and almost the same amount of nucleoside triphosphate (predominantly as cytidine triphosphate).

It would be of interest to determine the influence of —SH inactivating agents on both the aerobic and anaerobic incubation of mevalonic acid labelled with carbon-14 in fresh latex to establish the similarity or otherwise of the general reductive mechanism in the two instances.

Isolation of the Neurotoxic Component of the Venom of the Sea Snake, *Enhydrina schistosa*

THE sea snake, *Enhydrina schistosa*, is widely distributed in the coastal regions of the Far East and many fatalities from its bite are reported[1]. The *LD*50 of the venom for a wide variety of laboratory mammals is in the region of 50–100 μgm./kgm. body-weight. On this basis it is four times as toxic as the venom of cobra. Venom yields per bite of up to 55 mgm. of dried venom have been obtained from captive snakes. If humans are of equal susceptibility to laboratory animals, up to 15 *LD*50 for humans may be expected from one bite. At present there is no supply of antivenom available for treatment, and it is doubtful if the titres obtainable by even the best available preparative methods would be sufficient to allow the antivenom being administered in a life-saving dose. The separation of the neurotoxic component of this venom is important from the point of view of analysing its biochemical actions and enhancing its antigenic properties.

Carey and Wright[2] have shown that the whole venom consists of at least three antigenic components. The neurotoxic component is the most electropositive (*p*H 6·8 in agar gel) and will pass through a cellulose but not a nylon dialysis sac.

In the present investigation it has been found that after repeating the cellulose sac dialysis against large volumes of distilled water approximately 1 per cent of the initial toxicity remains inside the sac. This may be due to a different toxic component or to adsorption of traces of dialysable component on to non-dialysable material. However, it is unlikely to contribute significantly to the toxicity of the whole venom. Immunoelectrophoresis of the cellulose sac dialysate using antiserum to the whole venom shows only one main precipitation line. However, this has since been shown to consist of at least two antigenic components by varying the relative concentrations of venom and antiserum in the immunoelectrophoresis. When the dialysate was placed on a carboxy methyl cellulose column and eluted with *p*H 6·6 buffers of graded molarities from 0·06 to

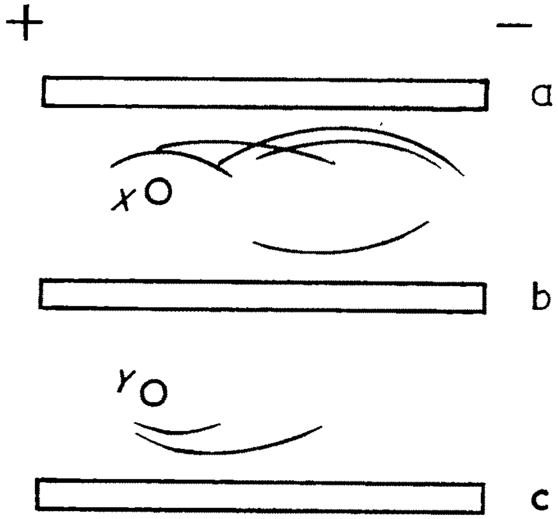

Fig. 1. A diagram of the immunoelectrophoretic patterns obtained with *Enhydrina schistosa* venom at *p*H 6 8 in phosphate buffer and electrophoresed for 3 hr. at 4 volts/cm. *a*, Antiserum to the whole venom in channel; *b*, antiserum to the toxic fraction in channel; *c*, antiserum to the whole venom in channel; *X*, whole venom at origin; *Y*, whole venom mixed with excess antiserum to the toxic fraction at origin

0·08 *M*, a further purification of the toxic component was obtained. Toxicity equivalent to 80–100 per cent of that of the initial sample was recovered in the eluant in one sharply defined zone. Immunoelectrophoresis of this sample using antiserum to the whole venom gave one precipitation line only over a range of relative concentrations of venom and antiserum. When whole venom is mixed with excess antiserum prepared against the toxic fraction only, the supernatant is non-toxic but still contains antigenic material as demonstrated by immunoelectrophoresis. The immunoelectrophoretic patterns of this supernatant material compared with that of the whole venom using antiserum to the whole and fractionated venom are shown in Fig. 1. An antiserum to this one fraction may therefore be as useful therapeutically as an antiserum to the whole venom. There was, however, no demonstrable advantage in using the purified toxic fraction as the antigen in the preparation of a protective serum.

Conflicting reports have appeared in the literature regarding the importance of a lecithinase in the toxicity of some venoms[3-5]. For demonstrating lecithinase activity we incubated the venom with egg yolk and then tested the solution for hæmolytic activity. After dialysis using a 'Cellophane' membrane, more than 90 per cent of the lecithinase activity of the whole venom could be retained inside the sac while more than 90 per cent of the initial toxicity passed through. This distinction between the two factors is further supported by the finding that the toxicity of the whole venom is more readily destroyed by heating than is its lecithinase activity.

Transglucosidase Activity in *Acetobacter xylinum*

Cells of *Acetobacter xylinum* are known to produce cellulose. This synthesis has been demonstrated in resting fresh and lyophilized cells[1,2]. Enzymic synthesis of cellulose by preparations from *A. xylinum* has been shown with the aid of tracer techniques[3,4] and electronmicrography[5].

Glaser's experiments[4] with uridine diphosphoglucose labelled with carbon-14 in the glucose moiety demonstrate the incorporation of glucose into cellulose via uridine diphosphoglucose:

$$\text{uridine diphosphoglucose} + (\text{glucose})_n \longrightarrow \text{uridine diphosphate} + (\text{glucose})_{n+1}$$

No experimental evidence has been presented for the reverse reaction, that is, the formation of uridine diphosphoglucose from uridine diphosphate and soluble cellodextrins. If the reaction is reversible, cellodextrin molecules may serve both as donors and acceptors of glucose units; the donors thereby become shorter, while the acceptors increase in length. Most likely there is a certain probability for obtaining some alkali-insoluble chains of high molecular weight.

In the present experiments a net increase of alkali-insoluble carbohydrate material was found upon the addition of uridine diphosphate and soluble cellodextrins (the soluble cellodextrins were made by a modified procedure of the method given by Zechmeister *et al.*[6]) to a preparation from *A. xylinum*.

Pellicles of *A. xylinum* (N.C.I.B.8246) were freed from cellulose by the method of Hestrin and Schramm[2], the cells were ruptured, with careful *p*H control, with an ultrasonic disintegrator, and centrifuged to eliminate remaining cells and cell-debris. In some experiments the cell-free extract was used as such. Attempts were made to fractionate the extracts by collecting the precipitates at 19,000*g* and 35,000*g*, and resuspending the pellets in 0·1 *M tris*(hydroxymethyl)aminomethane buffer of *p*H 8. The reaction was carried out in centrifuge tubes kept in an evacuated container at 30° C. After 20 hr. NaOH was added to a final concentration of 1 per cent, and the tubes were heated in a boiling water-bath for

Table 1

Experiment	Additions	Alkali-insoluble material formed. As: Hexose (μgm)	Net increase (per cent)
1	None	180	—
	Uridine diphosphoglucose	200	11
	Uridine diphosphoglucose, cellodextrins	320	78
	Cellodextrins	220	22
2	None	8	—
	Uridine diphosphoglucose	12	50
	Uridine diphosphoglucose, cellodextrins	17	112
	Cellodextrins	14	75
3	None	70	—
	None	68	—
	Uridine diphosphate, cellodextrins	188	172
	Cellodextrins	118	71
	Uridine diphosphate, cellodextrins, cellobiose	184	167
	Cellodextrins, cellobiose	94	36
	Uridine diphosphate, cellobiose	56	—
	Cellodextrins, unincubated	64	

Each tube contained 1 ml. enzyme preparation of *p*H 8, plus additions as given, in the following amounts uridine diphosphoglucose, 8 5 μmoles; uridine diphosphate, 9·7 μmoles; cellobiose, 59 μmoles; cellodextrins, 15–20 mgm.; total volume per tube, 2 ml Different enzyme preparations were used in the three experiments. In 1, the pellet from 19,000*g*; in 2, the pellet from 35,000*g*; and in 3, the non-fractionated extract.

5 min. and then centrifuged. The precipitates were washed twice with water and dried. Hexose was determined by the anthrone method[7]. The results are presented in Table 1.

These results indicate the presence of transglucosidase activity in the preparation from *A. xylinum*. The insolubilization of soluble cellodextrins through the action of transglucosidase will from statistical reasons be expected to give low yields of high molecular weight compounds. Further work is in progress to purify to some extent the enzyme system in order to investigate the nature and specificity of co-factors in the reaction.

Preparation of Crystalline Cytochrome$_{553}$ from *Porphyra tenera*

PARTIAL purification of a cytochrome component from *Porphyra tenera*, a component which has absorption peaks similar to that of cytochrome *c* or c_1 was first reported by Yakushiji[1]. Recently, Katoh and Takamiya (ref. 2 and Katoh, S., and Takamiya, A., personal communication) succeeded in obtaining a crystalline preparation of this component by means of diethylaminoethyl-cellulose column chromatography and reported the redox-potential of this and other components in marine algae. We also have crystallized the cytochrome by means of a cation-exchanger at *p*H 5·0. Since the diethylaminoethyl-cellulose column procedure is possible at *p*H 7·0, this procedure may be better; our method can be used to purify not only basic enzyme proteins, but also those that are stable in acidic *p*H.

About 700 gm. of the algae dried by exposure to the Sun was suspended in 12 l. of water and kept for 3 days at 15°. The suspension was squeezed through a cheese-cloth and about 11 l. of reddish-violet extract obtained. To this extract solid ammonium sulphate was added to obtain a concentration of 50 per cent saturation and the resulting precipitate, which contains almost all phycobilin, was removed from the extract by filtration. To recover the cytochrome from the precipitate, the precipitate was dissolved in 1 l. of 0·05 *M* disodium hydrogen phosphate and the above fractionation was repeated with ammonium sulphate. Both filtrates were combined and the cytochrome precipitated by further addition of ammonium sulphate to raise the concentration to 100 per cent saturation. The precipitate, collected by filtration with the aid of 'Celite', was dissolved in about 500 ml. of 0·05 *M* disodium hydrogen phosphate and 1 per cent of rivanol added drop by drop to the solution until fibrous substances no longer formed. These substances were removed by filtration and the filtrate fractionated with ammonium sulphate to obtain a fraction between 80 and 100 per cent saturation. By repeating this fractionation twice, an excess of rivanol was removed. The precipitate was dissolved in 50 ml. water and dialysed against 2 l. of 0·02 *M* sodium acetate buffer of *p*H 5·0 overnight at 5°. After the dialysis, the solution was centrifuged to remove dark brown precipitates which appeared during the dialysis. The clear supernatant fluid was then charged on the top of column (1 × 50 cm.) of a cation-exchanger ('Amberlite *CG*–50', type II) buffered at *p*H 5·0 with the same buffer. The column adsorbed the cytochrome and was washed with 2 l. of the same buffer and then 2 l. of 0·1 *M* sodium acetate buffer, *p*H 5·0. These washings eluted some of the impurities and modified cytochrome. The adsorbed cytochrome was then eluted with 0·1 *M* sodium acetate buffer of *p*H 5·8. About 1 l. of eluate contained cytochrome which was concentrated by treatment with polyethyleneglycol[3]. This chromatography was carried out in the oxidized state, though chromatography is also possible in the reduced state at *p*H 5·0. In the latter case, however, an affinity of the cytochrome for resin is less than that of the oxidized state, so that the elution process was performed with 0·02 *M* buffer at *p*H 5·0 and it is necessary to repeat the chromatography twice in order sufficiently to remove the impurities. To the eluate solid ammonium sulphate was added to precipitate the cytochrome completely. The cytochrome was collected by centrifugation and dissolved in a minimum amount of water. Insoluble material is removed by centrifugation, and solid ammonium sulphate was added to the supernatant fluid by a small glass rod in several portions until small turbidities appeared. The solution was kept in a tap-water bath and the turbidity slowly increased. Within 2–3 hr., the crystals began to appear and almost all the cytochrome crystallized as needles within 1 day. The crystals were collected by centrifugation, washed with 90 per cent saturated ammonium sulphate solution, dissolved in a minimum amount of water, and then recrystallized as above.

Fig. 1 shows the absorption spectrum of a once-recrystallized preparation dissolved in 0·1 *M* phosphate buffer of *p*H 7·4. The α-band of the cytochrome shows its peak at 553 mμ and a shoulder at about

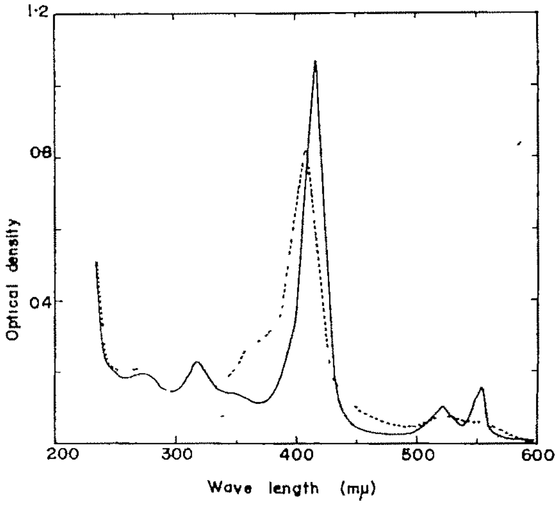

Fig. 1 Absorption spectrum of cytochrome$_{553}$ from *Porphyra tenera*. The crystals were dissolved in 0·1 *M* phosphate buffer of *p*H 7·4 and dialysed against the same buffer. Measurements are carried out by a Cary spectrophotometer Model 14 by using a 1-cm. light-path cuvette. The dotted line shows the oxidized form and the solid line the reduced form after the addition of sodium borohydride

550 mμ. However, other peaks are similar to that of beef cytochrome c or c_1. The absorption peaks of pyridine hæmochromogen at a high pH are similar to that of cytochrome c and the α-peak has no longer a shoulder. The hæm cannot be split from the protein moiety by the usual acid–acetone method (1 ml. 20 per cent hydrochloric + 100 ml. acetone). From these results it appears that the hæm of the cytochrome belongs to hæm c. The reduced cytochrome is not autoxidizable and is oxidized by cytochrome a_2 purified from *Pseudomonas aeruginosa*[4], but not by mammalian cytochrome a[5].

This investigation was supported in part by Grant *RG*-5871 from the U.S. National Institutes of Health.

ANIMAL PHYSIOLOGY

Withdrawal of Inhibition of Mitosis as a Mechanism Influencing Normal and Pathological Growth

EXPERIMENTAL evidence has recently been given[1] of the likelihood that wound-healing occurs not from the stimulation of wound hormones directly, as has been thought for many years, but by the withdrawal of inhibiting influences as a result of cell damage.

Several experiments performed in this laboratory using regenerating liver of rats and guinea pigs have demonstrated that corticosteroids act as inhibitors to growth, and circumstances in which these substances are withdrawn or reduced have simulated a 'growth hormone effect'. From these observations a mechanism has been proposed which could account for some features of rapid tumour growth, and attention has been directed to the similarity of conditions in wound healing[2].

The histological appearances and mitotic index have been found to be similar in three different systems which have in common a reduced corticosteroid to growth hormone ratio.

In the first system, Cater, Holmes and Mee[3] showed that injections of pure growth hormone to intact rats caused an increased mitotic rate and synthesis of deoxyribonucleic acid. The mitotic index was approximately double that found in normal rat regenerating liver. The influence of pituitary hormones and cortisone on liver regeneration rate in hypophysectomized rats was then investigated[4]. Cortisone caused complete inhibition of mitosis, which was overcome proportionately as the dose of growth hormone was increased. Growth hormone alone to hypophysectomized rats did not increase the rate of mitosis after partial hepatectomy.

The second system used was the regenerating liver of the adrenalectomized rat in which the rate of mitosis and histological appearances are identical with those of intact rats given growth hormone. A large number of such rats were examined and a study made of the influence of time between adrenalectomy and partial hepatectomy (unpublished work). During the first 48 hr. no inhibiting influence is present and an approximate doubling of normal regeneration rate is seen but after 7 days a return to normal mitotic index occurs.

The third system involved liver regeneration in rats bearing Walker 256 carcinomas. Observations were made of resting liver mitoses, of the mitotic rate 29 hr. after partial hepatectomy, of adrenal weights and of liver glycogen as an indication of corticosteroid output at that time. Two groups were compared, rats bearing large fast-growing tumours and those bearing small slow-growing tumours. It was found that resting liver mitosis rates averaged seven times greater in tumour-bearing rats than in normal rats. Regenerating liver from the fast-growing tumour-bearing rats had a very high mitotic index, not significantly different from that found in adrenalectomized rats. Regenerating liver of slow-growing or arrested tumour-bearing rats had a mitotic index equal to or less than that of normal rat regenerating liver. Liver glycogen in the two groups was significantly different, the larger fast-growing tumour rats tending to have less liver glycogen than liver from a normal rat, while the slow-growing tumour rat deposited about twice the liver glycogen of a normal rat. These glycogen estimations were not regularly consistent but are believed to indicate trends in circulating corticosteroid values.

Taken together, the findings from tumour-bearing rats suggest lower corticosteroid levels in those rats with the fastest-growing tumours. The liver mitosis rates and histological appearances are similar to those found in adrenalectomized rat regenerating liver and the growth hormone-treated rat. These are 'growth hormone like' appearances due in the first two sytems to reduction in the ratio of corticosteroids to growth hormone. In the third system of tumour-bearing rats either a reduction of circulating corticosteroids or some reduction of their effectiveness would account for the similar mitotic index and histological appearances.

Some evidence is being obtained from experiments not yet completed that corticosteroids can be rendered ineffective with regard to their influence on mitosis. It is known from system two mentioned above that removal of corticosteroids from the rat allows an approximate doubling of the normal rate of mitosis in regenerating liver. From experiments of workers[5,6] in the field of ascorbic acid relationship to corticosteroid synthesis and as a direct result of an experiment demonstrating corticosteroid influence on the radiation effect[7], it seemed possible that certain redox chains depending for their integrity on the presence of ascorbic acid were permissive in allowing corticosteroid activity. It seemed that a 'functional adrenalectomy' might be obtained in the guinea pig by deprivation of ascorbic acid so that partial hepatectomy in this animal (unreported work) might reveal a doubling of mitosis-rate over that of normal guinea pig regenerating liver, as has been found in the adrenalectomized rat. The difficulties in this procedure are being overcome and will form a full report as soon as statistically satisfactory results are obtained. To date 9 normal guinea pigs have survived partial hepatectomy and show a mean regeneration rate of 24 mitoses per 1,000 cells. Mortality among scorbutic guinea pigs is high but of 30 animals 3 have survived with a mean mitotic index of 50. This is a positive result which is unlikely to occur under any other conditions and each individual result should have meaning. To support this, 10 other animals have survived which were believed to have been fully scorbutic but which showed no mitoses in the liver after the same regeneration time. This is consistent with the idea of a low threshold-level of ascorbic acid, and until this is reached, adequate though small amounts of ascorbic acid permit corticosteroid inhibition of mitoses. Very high levels of circulating corticosteroids are known to occur in scorbutic animals[8] and these undoubtedly inhibit all mitoses.

If withdrawal of corticosteroid influence is a likely means of instigation of growth processes, some special mechanism must occur in wound-healing to overcome locally the influence of the raised corticosteroid circulating levels which are inimical to the processes of inflammation and repair. It is suggested that damaged cells may secrete or produce an oxidizing agent in minute amounts which exerts an influence only in the area of damage. Thus neither ascorbic acid nor corticosteroid levels in the circulation need be depleted and may not be found changed on investigation. It is known that following X-irradiation in animals excretion of dehydro-ascorbic and di-ketogulonic acids is increased[9].

These studies have had as an object the mechanism of failure of control of tumour cell growth and it seems likely that tumours act as damaged cells. In addition to their own point of damage which shows itself as, among other things, a failure to respond to circulating corticosteroids[10], it is likely that a spreading influence, at first confined to the immediate cell boundary, but later in an attenuated form perfusing the circulation, renders the host more liable to establishment of metastases and to multiple tumours. Some very recent evidence[11] supporting this concept is of the growth of dormant injected tumour cells in the liver after mere handling of this organ. The fact that an injected tumour-cell population needs to be of a minimum size for survival suggests some ability to influence the host which may not be only of an antigenic nature.

I am grateful for the advice and encouragement of Prof. J. S. Mitchell and for the support of the Medical Research Council during the course of this work.

Effect of Chlorpromazine on Tissue Metabolism *in vitro*

IT has been pointed out that central inhibition is connected with an increase of acetylcholine content in brain tissue. On the other hand it has also been shown that some central depressants reduce the oxygen uptake of normal respiring brain tissue *in vitro*[1] or in brain slices which were stimulated electrically[2].

In previous experiments we have seen that chlorpromazine as a tranquillizing drug can also enhance the acetylcholine content in the brain of rats[3]. Further results have confirmed the inhibitory effect of chlorpromazine (even in low doses of 1–10 µgm./ml.) on the rate of oxygen uptake in brain homogenates metabolizing glucose as substrate. However, chlorpromazine did not inhibit uptake of oxygen in the presence of succinate[4].

Studying these relationships we have investigated the direct influence of acetylcholine on the respiratory activity of brain homogenates (albino rats) *in vitro*. The oxygen uptake was followed by the direct Warburg technique (buffered Krebs–Ringer phosphate solution, pure oxygen, 37° C.). The brain tissue was homogenized in the presence of eserine. Results are given in Table 1. Eserine alone did not change the respiration significantly. The lack of some changes after acetylcholine is in agreement with the findings of McIlwain[5] obtained in brain slices of the rat. Similar negative results were observed with the oxygen uptake of hemi-diaphragm slices incubated with acetylcholine.

The inhibitory effect of chlorpromazine on the endogenous respiration (no substrate added) of brain homogenates was reached at relatively high concentration of this substance only. This effect was deepened when ammonium chloride was added simultaneously with chlorpromazine (Table 2).

Contrary to the results of Abood[6] obtained in a mitochondrial preparation of the brain, we could not confirm the inhibitory effect of chlorpromazine on cytochrome oxidase activity in brain homogenates. Enzyme activity was followed by oxidation of 5 m*M* *p*-phenylenediamine during the first hour after addition of chlorpromazine to the brain homogenate. In controls the mean value with standard error of 6 exp. was 143·6 ± 4·7 (µl. oxygen)/100 mgm. wet

Table 2. INHIBITION OF THE ENDOGENOUS RESPIRATION AFTER ADDITION OF CHLORPROMAZINE AND AMMONIUM CHLORIDE IN BRAIN HOMOGENATES. MEDIUM: KREBS–RINGER SOLUTION (NO SUBSTRATE ADDED). THE INHIBITION IS SIGNIFICANT

No. of experiment	Treatment	µl. O_2/100 mgm. wet w./hr.		Inhibition (per cent)
		Mean	*S.E.*	
9	Control	82·72	± 1·98	
6	Chlorpromazine (200 µgm./ml.)	62·73	± 3·08	− 24·17
8	NH_4^+ (60 m*M*)	64·74	± 2·87	− 21·8
9	NH_4^+ (60 m*M*) + chlorpromazine (200 µgm./ml.)	51·87	± 3·9	− 37·3

weight (hr.) and after addition of 200 µgm. chlorpromazine/ml. the oxygen uptake was 143·2 ± 3·5.

We have reviewed the specificity of the action of chlorpromazine on cerebral tissue. It did not influence the oxygen uptake of rat's hemi-diaphragm slices metabolizing glucose as substrate. In control animals the mean value with standard deviation of 7 exp. was 95·5 ± 13·4 (µl. oxygen)/100 mgm. wet weight (hr.) and after 10 µgm. chlorpromazine/ml.—94·7 ± 10·3. In 6 exp. after addition of 200 µgm. chlorpromazine/ml. the oxygen uptake showed the value 94·4 ± 11·3.

It can be assumed that chlorpromazine produces an impairment in energy metabolism of the brain tissue such as depletion of oxygen uptake and inhibition of oxidative phosphorylation[7]. On the other hand chlorpromazine exerts no significant changes in cholinesterase activity of the brain as reported by Decsi[8] and it does not affect the synthesis of acetylcholine studied in brain homogenates of the rat[9]. These negative results favour the view that the increase of acetylcholine content following chlorpromazine is due to the depression of central activity without direct relation of chlorpromazine to the acetylcholine metabolism of the brain.

Action of Thyroxine on the Rate of Oxygen Consumption of the Lung-Fish (*Protopterus*)

THE part that endocrines play in the control of metabolic rate of fishes has been investigated by numerous authors. The results concerning the action of thyroxine are contradictory[1–5]. This is mainly due to two essential factors: (1) feeding; (2) activity during measurements[6]. The current investigation was initiated to determine the effect of thyroxine upon the rate of oxygen consumption of *Protopterus*. These fish do not present the above-mentioned difficulties.

Two young individuals were captured from Tienaba (in the vicinity of Dakar), in February (during the aquatic phase), and were maintained in water until the beginning of the experiments in April. Each fish served as its own control, and thus individual variations were eliminated. The first presented external gills, the second only vestigial ones. The total wet weight of the fish was 27·5 and 46 gm. respectively. (The initial weight of the animals before the experiments was the only one taken into consideration.)

The rate of oxygen consumption was measured by means of Haldane's blood gas volumeter, slightly modified for this purpose. The reaction bulb was replaced by a respiratory chamber, inside which was introduced a small quantity of water, the animal and a small tube containing a carbon dioxide absorbent. This apparatus permitted us to measure the volume of oxygen absorbed by the animal to the nearest 0·01 c.c.

The normal rate of oxygen consumption of each individual was followed during the three days preceding the thyroxine injection and several readings taken. Each fish received a single intra-muscular injection of approximately 0·5 c.c. of thyroxine (Roche), in the dorsal muscles.

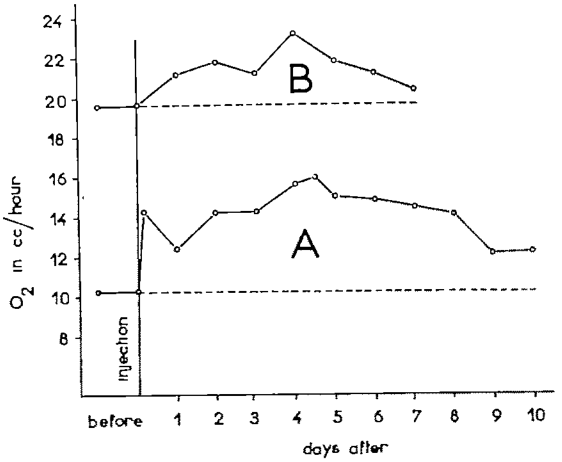

Fig. 1. Action of thyroxine on the rate of oxygen consumption of *Protopterus*

In both cases there was a remarkable increase in the rate of oxygen consumption, one day after injection (Fig. 1). The respiratory rate was maximal about the fourth day, then it dropped gradually during the following days in order to reach approximately its initial level.

Presence of 5-Hydroxytryptamine after Raunescine in Blood Plasma *In vivo*

5-Hydroxytryptamine is localized in the platelets of the blood, minimal amounts being found in platelet-free plasma[1–3]. *Rauwolfia* alkaloids are known to lower the content of 5-hydroxytryptamine in various tissues including blood both *in vivo* and *in vitro*[4,5]. Whether 5-hydroxytryptamine is released by *Rauwolfia* alkaloids from the cellular binding sites as such to the cytoplasma is still not clear. It has been stated that the incubation of rabbit platelet suspensions with reserpine in an atmosphere of nitrogen increases the amount of 5-hydroxytryptamine in plasma[5].

We have investigated whether 'free' 5-hydroxytryptamine can be found in plasma after a *Rauwolfia* alkaloid. As in the earlier experiments[6], which originally directed our attention to this problem, we have used raunescine, which is an alkaloid chemically and pharmacologically closely related to reserpine[7].

3 ml. of blood was collected by using a polyethylene cannula from the abdominal aorta of male rats (160–180 gm.) anæsthetized with ether. Each time one of the rats served as a control and the three others that received 5 mgm./kgm. of raunescine intraperitoneally were bled 1, 3 and 6 hr. after the injection. The blood was mixed with 1/10 vol. of 1 per cent disodium ethylenediamine tetraacetate and 30–50 int. units of heparin/ml. After separation of plasma and platelets[8] the platelet-poor plasma was extracted by 19 vol. of acetone[9] and the packed platelets, after suspension in acid saline, by 10 vol. of acetone. The samples were kept at around 0° C. during the whole pre-extraction period. The biological assay of 5-hydroxytryptamine was made by using the rat stomach preparation[10]. For collecting the blood from the rabbits a catheter was inserted into a cervical vein under light ether anæsthesia, from which the animals were allowed to recover before the withdrawal of blood. In half of the experiments the animals were pre-treated with 100 mgm. (as base)/kgm. of iproniazid phosphate subcutaneously about 16 hr. before raunescine.

The results from rats are presented in Fig. 1. There was a gradual fall in the platelet 5-hydroxytryptamine, and after 6 hr. about 10 per cent was left in the non-pretreated rats and 14 per cent in those receiving iproniazid. Platelets were counted in some tests and they had about 1 µgm. of 5-hydroxytryptamine/10^9 cells on both series. Raunescine did not change the number of them. In the plasma there was a rise in both groups when analysed 1 hr. after raunescine administration. The increase was more than 10-fold in the pre-treated rats, being less marked in the others. The return to normal was also faster in the animals that received raunescine only.

Essentially similar but less consistent results were obtained by using rabbits. The increase of plasma 5-hydroxytryptamine was not as marked as in rats and it was negligible without iproniazid pre-treatment.

The 5-hydroxytryptamine in plasma probably comes from the platelets; but the possible release from other tissues cannot be excluded. The highest amounts of amine in the plasma were found at the time of the most marked release from the platelets. It has been reported that human serum oxidizes 5-hydroxytryptamine[11]. This activity could be inhibited by iproniazid, ceruloplasmin being suspected as the enzyme involved. Therefore the effect of iproniazid in our experiments may not be due to the inhibition of monoamine oxidase. It is interesting to note that the symptoms produced by raunescine become fully developed at a time when the plasma 5-hydroxytryptamine has returned to normal.

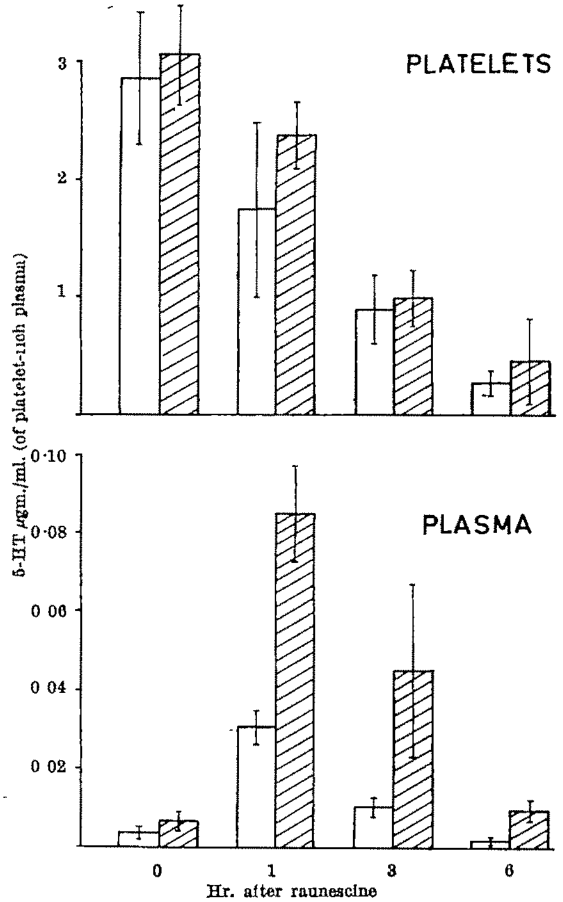

Fig. 1. The amounts of 5-hydroxytryptamine in platelets and platelet-free plasma of rats after raunescine. Each column represents the results from four experiments. Open columns, no pre-treatment; shaded columns, iproniazid pre-treatment; vertical lines, standard deviation

This work has been supported, in part, by the Sigrid Jusélius Foundation and the State Commission for Natural Sciences. We are indebted to Abbott Laboratories for 5-hydroxytryptamine, Hoffmann-La Roche and Co. for iproniazid and S. B. Penick and Co. for raunescine.

Adrenocortical Function after Prolonged Salt Restriction in Hypertension

It has been suggested that the high salt intake current in most modern societies is beneficial by virtue of a presumptive stimulating action on the adrenal cortex[1]; it also has been reported[2] that *in vitro* production of corticosterone by the isolated adrenals of sodium-depleted rats declined progressively as a function of time, from which it has been inferred that limitation of salt intake might impair adrenocortical function resulting in an organism less responsive to stress. By contrast, there is considerable evidence implicating sodium in the hypertensive process both of man and animals[3]; furthermore, some results suggest that a high salt intake may be a causal factor in the etiology of human 'essential' hypertension—the second commonest cause of heart disease in Western society[4]. According to the latter view, a high salt diet would not be beneficial and might be frankly harmful.

It has been clearly established by many studies that under normal conditions metabolic balance can be maintained easily on daily salt intakes of 0·5–1·0 gm.—or approximately one-twentieth the amount commonly eaten by the average Western adult[4c]. A number of adrenocortical function studies made on man after short-term salt restriction have shown normal corticoid production with variable evidence of increased aldosterone production (for example, ref. 5). The long-term effects of salt restriction on adrenocortical function have not been studied but have assumed increasing importance with the widespread use of low salt diets in medicine: it is this aspect with which we are concerned here, brief mention of which was made in an earlier communication[4b]. A unique opportunity to make such observations was provided by 3 ambulatory subjects maintained on accurately measured diets, which contained only 100–150 mgm. of sodium (250–375 mgm. as sodium chloride) daily, for periods of from 1 to almost 5 years. We are aware of no natural diet which is so restricted in sodium as that used in the present work, and no suggestion is intended that comparable levels are necessary or advisable for the population generally: the present regimen for these patients was a deliberately severe test of the adaptive capacities of the adult organism carried out under careful supervision. The subjects included a 69-year old white widow and 2 white bachelors of 49 and 51 respectively (ages on admission). All had classical uncomplicated essential hypertension; they were ambulatory and went for long walks on the laboratory grounds ordinarily at least once daily. 24-hr. urine collections were made continuously and at no time was there evidence of extra salt intake. Numerous studies carried out on these individuals have been omitted unless clearly relevant to the current discussion. It is pertinent to note that on admission the 49-year old male was found to have an eosinophilia of 4–15 per cent which was not explained and which persisted in the hospital.

The observations reported here, unless otherwise indicated, were made after 58, 32 and 20 months on low salt regimen by the 69-year old woman, and the 49- and 51-year old men, respectively. Physically, in terms of disease entities or syndromes known to be related to the adrenal cortex, these subjects presented no evidence of either hypo- or hyper-corticism. All three had some personality peculiarities on admission which did not change with salt restriction: they appeared normal and acted normally and reported that they felt normal. The following laboratory studies, some of which may be abnormal with various states of adrenocortical dysfunction, were normal and essentially unchanged from the results obtained prior to salt restriction: plasma protein and specific gravity; hæmoglobin, hæmatocrit, white blood count and differential; urea clearance and blood urea nitrogen; plasma sodium, potassium, chloride and carbon dioxide; total exchangeable sodium as measured with sodium-24. Blood sugars remained normal both after eating and after a 24-hr. fast; intravenous glucose tolerance tests showed normal curves. The response to intravenous adrenocorticotrophic hormone[6] is summarized in Table 1. A normal fall in total circulating eosinophils occurred following the infusion of adrenocorticotrophic hormone, to 10 per

Hydrocortisone	34–262 μgm.	309	412	(not done)		92	113
Months off sodium chloride		56		19		19	

cent or less of control values. The urinary excretion of both 17-ketosteroids and 17-hydroxycorticoids during the control days was within normal range and the subsequent response to the infusion of adrenocorticotrophic hormone indicated a normal adrenocortical reserve. Maintenance of sodium chloride balance during this period of severe restriction is *a priori* evidence of adequate production of salt-retaining hormones although no necessary indication of corticoid production. The daily urinary excretion of aldosterone, cortisone, and hydrocortisone[7] is summarized in Table 2. The significance of the slightly increased excretion of cortisone and hydrocortisone by the woman is doubtful in view of the wide range of normal, and in association with the normal values shown in Table 1 as well as the absence of other biochemical or clinical evidence of increased corticoid production. The aldosterone excretion for the 51-year old male appears elevated to levels reported for some studies[5] after short periods of salt restriction: the other two patients did not show this effect. From the results in Tables 1 and 2 we have concluded that prolonged salt restriction is associated with normal adrenocortical steroid production. We are aware that urinary excretion need not necessarily reflect adrenocortical production of steroids, and these results must be interpreted with this restriction. It is proper to ask whether the results reported here would hold in non-hypertensive individuals. We have subjected non-hypertensive persons to equal salt limitation for periods up to 3 months with similar findings, so it is unlikely that this capacity is peculiar to the individual with hypertension. Furthermore, during the past 12 years in an experience with more than 100 other individuals studied on this same regimen for periods as long as 1 year we have never found evidence of adrenocortical dysfunction.

From these studies, we cannot refute the suggestion that a high salt diet is beneficial but the evidence presented suggests that a prolonged and drastic low salt diet is compatible with normal adrenocortical function.

Effect of Age on the Heparin Content of Rat Skin

IN 1955, Shetlar and Masters[1] demonstrated a change with age in the composition of acid mucopolysaccharides of human cartilage. They found that both uronic acid and hexosamine decreased with age but the decrease in hexosamine was less striking, indicating a relative increase in some hexosamine-containing polysaccharide. Further evidence for a shift in the relative proportions of acid mucopolysaccharides in ageing cartilage was provided by Kuhn and Leppelmann[2], who reported a decrease in the ratio of galactosamine to glucosamine. Recently, Kaplan and Meyer[3] observed that the content of chondroitinsulphuric acid in human cartilage decreased and that of keratosulphate increased with age. On the basis of an increasing glucosamine to galactosamine ratio, Hallén[4] concluded that the ratio of keratosulphate to chondroitinsulphuric acid in human nucleus pulposus increased with age. A difference in the distribution of mucopolysaccharides between embryonic and mature pig skin was reported by Loewi and Meyer[5]. They found that hyaluronic acid comprised 78 per cent of the total skin mucopolysaccharides in the embryo and only 30 per cent in the adult, whereas chondroitinsulphuric acid-*B* represented 5–12 per cent in embryonic skin and 64 per cent of total mucopolysaccharides in adult skin.

The development of quantitative methods for extracting and separating mucopolysaccharides from tissues has made it possible to investigate the relationship of age and the qualitative and quantitative mucopolysaccharide content of skin. These studies lead to the isolation of heparin in relatively large amount from rat skin. Analysis of skin from rats of various ages demonstrated increased concentrations of all mucopolysaccharides in the very young animal. Most dramatic, however, were the changes in heparin concentration.

Acetone-dried skin from male Sprague–Dawley rats, ranging in age from 21 days to 2·6 years, was extracted by a modification of a method published previously[6]. The mucopolysaccharide mixture was precipitated by cetyl pyridinium chloride in the presence of 'Celite' as described by Korn[7]. Hyaluronic acid, the chondroitinsulphuric acids, and heparin, were extracted by successive washes with 0·3 *M*, 1·2 *M* and 2·1 *M* sodium chloride, respectively.

The results, presented in Table 1, are expressed as μgm. of uronic acid (as determined by the carbazole reaction[8]) per gm. of acetone-dry skin. The concentration of hyaluronic acid and chondroitinsulphuric acid in young rats was found to be approxim-

Table 1. EFFECT OF AGE ON CONCENTRATION OF MUCOPOLYSACCHARIDES IN RAT SKIN

Age (days)	Hyaluronic acid	Chondroitinsulphuric acid	Heparin
	(μgm. uronic acid/gm. dry rat skin)

23*	894	406	562
44*	1,232	337	388
57*	439	218	100
74*	540	197	92
217*	578	273	111
406	320	140	70
473	450	200	110
561	480	257	68
893	380	135	35
951	538	256	100

* These results were obtained from pools of 8–10 rat skins for each age group. In the older age groups, the results represent values from individual animals.

ately twice that in mature animals. The amount of heparin in young animals was surprisingly large. After 50 days of age the heparin concentration had diminished by 75 per cent. Thereafter, the level of all acid mucopolysaccharides in skin appeared to remain fairly constant.

In order to demonstrate unequivocally that the mucopolysaccharide present in the 'heparin' fraction was indeed heparin, 56 gm. of acetone-dried rat skin were extracted and the mucopolysaccharides separated as above. Approximately 9 mgm. of mucopolysaccharide were isolated from the 'heparin' fraction. The material was subjected to chromatography on 'Dowex 1 × 2', chloride resin, using increasing concentration of sodium chloride for elution. Heparin was removed with 2 *N* sodium chloride. Analyses showed hexosamine, uronic acid (by the carbazole reaction[8]) and ester sulphate to be present in a molar ratio of 1·0 : 1·6 : 2·0, respectively. The amino-sugar, determined by the method of Stoffyn and Jeanloz[9], was glucosamine. The substance had a specific rotation of + 90° and an anticoagulant activity identical to that of a commercial preparation of beef heparin (General Biochemicals, Inc.) with 136 units per mgm.

In view of the large number of mast cells in rat skin, the presence of heparin in this tissue is not surprising. Monkhouse *et al.*[10] reported heparin activity in extracts of rat skin but no chemical analyses were published, and their preparations contained a low order of anticoagulant activity.

Whether the heparin present in skin is entirely intracellular cannot be ascertained from the present data. It is conceivable that some heparin is secreted into the extracellular space during the life-cycle of the mast cell. This conjecture is consistent with a recent observation by R. S. Geiger and A. Dorfman (unpublished results) that granules are extruded from mast cells during culture of a mouse mastocytoma.

The finding of large amounts of heparin in skin and its relative decrease with age has many physiological implications. The role of heparin in lipæmia-clearing and blood coagulation suggests that changes in tissue concentration may influence these phenomena. It is possible that a local decrease in heparin affects deposition of fibrin or lipids.

A more detailed report of the methods and results will be published elsewhere.

This investigation was aided by grants from the United States Public Health Service (No. *H*-311) and the Chicago Heart Association.

A Possible Function of Planktonic Photophores

A NUMBER of unrelated groups of planktonic animals have developed the curious arrangement of upwardly directed eyes combined with downwardly directed photophores; this has been described and discussed by Hardy[1], who has suggested a number of possible explanations.

Could this singular arrangement sometimes constitute a mechanism whereby the members of a vertically migrating species can keep together even when the most important factor, light from the surface, is brusquely interrupted?

Consider a gregarious species, mainly light-controlled, which occupies depths between 600 m. and 800 m. on a fine day, and between 200 m. and 400 m. by night. At midday after a sunny morning the animals at 600 m. will be comparatively well illuminated, but those at 800 m. may be almost at the threshold of perception of daylight. Now suppose that, as must not infrequently happen, the Sun is suddenly obscured by thick cloud for the rest of the day. The highest animals will start to swim up towards the levels of light-intensity that suit them best; the deeper animals, however, cannot at once do so, for they are now suddenly unable to perceive any daylight at all. Their upward-pointing eyes, however, may be able to perceive the diminution, in size and intensity, of the pattern of the photophores of their relatives above them, now rapidly climbing. Since they are gregarious, this situation might urge them in their turn to climb, so as to keep station with their fellows.

In this way, I suggest, it may be possible for a species to undertake light-controlled vertical migrations, even though the light may be acting on many of the individuals only at second hand.

PLANT PHYSIOLOGY

Interaction of Growth Inhibitor and a Natural Germination Stimulator in the Dormancy of *Fraxinus excelsior* L.

DORMANCY of seeds of the genus *Fraxinus* has been variously ascribed to immaturity of the embryo[1], mechanical resistance of the seed coats[2,3], and the presence of growth-inhibiting substances within the pericarp[3] and in the mucilage surrounding the embryo[4]. A recent study of dormancy in the fruits of *F. excelsior* L. has shown that these explanations are inadequate.

When the fruit of *F. excelsior* is shed from the tree, the embryo is small, but morphologically complete. Before germination occurs, the embryo grows by cell division and cell extension from little more than half, to the full length of the seed. This occurs most rapidly in moist storage at warm temperatures (18–20° C.) and is greatly retarded by the presence of the pericarp, which apparently restricts the oxygen supply to the embryo. Even after the embryo is fully grown, neither the fruits nor the naked seeds germinate unless after-ripened in moist storage at 5° C. for at least 4 months. Excised, unchilled embryos remain dormant indefinitely if precautions are taken to preclude leaching, whereas embryos excised from chilled seeds begin to germinate immediately.

An extensive survey of the changes in growth-promoting and growth-inhibiting substances has been carried out during embryo growth, chilling and germination. Diethyl ether extracts, separated into acid and neutral fractions, and aqueous extracts were concentrated and chromatographed on paper using as a developing solvent 80 parts of *iso*propanol to 20 parts of 0·15 *M* ammonia. The chromatograms were assayed for active substances using the *Avena* coleoptile straight-growth technique, and embryos excised from seeds of *F. excelsior*.

Ether extracts of ungerminated seeds contain no growth-inhibiting substances, but a growth-promoting substance, tentatively identified as indoleacetonitrile by means of its R_F value in various solvents and colour reactions, is present in ether extracts of fresh seeds and gradually disappears during growth of the embryo. Aqueous extracts of dry seeds contain no growth inhibitors, but on imbibing the seeds with water an active growth-inhibiting zone R_F value 0·6–0·8 appears in the chromatograms of extracts of endosperms and embryos imbibed 24 hr., and increases in activity during the following 48 hr. This inhibitor not only prevents the growth of *Avena* coleoptiles, cress roots and the germination of lettuce seeds, but also inhibits radicle growth of excised embryos of *F. excelsior*.

Although the seeds germinate after chilling, no reduction in activity of the inhibitor in either the endosperms or the embryos could be detected during or after the period of chilling. After the initial stages of germination, however, a very slight reduction in activity was detected, accompanied by the appearance of an ether-soluble inhibitor with similar properties to the β-inhibitor of Kefford[5].

Excised, unchilled embryos germinate rapidly if leached in distilled water for 48 hr., whereas embryos excised from leached intact seeds remain dormant. A very slight reduction in the level of inhibitor was detected in leached embryos, but not in the embryos excised from leached intact seeds. If leached (non-dormant) embryos are placed on filter paper moistened with inhibitor solution, very little growth ensues This was used as the basis for biological assays in which ten leached excised embryos were placed in the eluates from sections of chromatograms in place of the ten coleoptile sections normally used. It was shown that the fraction which prevented embryo growth was identical with the inhibitor of coleoptile growth (Fig. 1), and was active at all stages of after-ripening and germination of the seed.

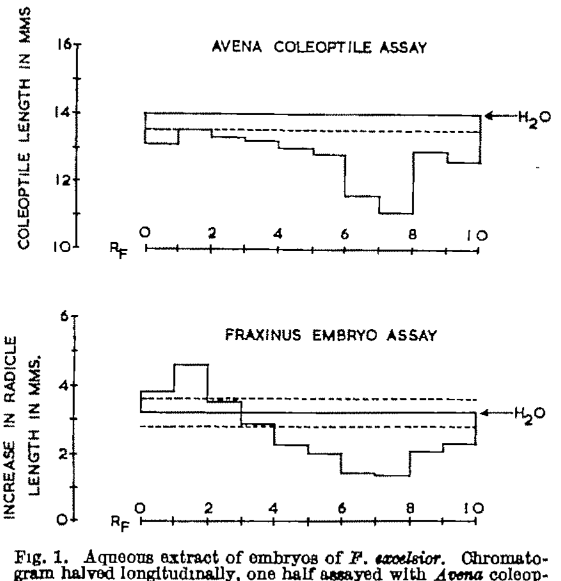

Fig. 1. Aqueous extract of embryos of *F. excelsior*. Chromatogram halved longitudinally, one half assayed with *Avena* coleoptile test, other half assayed with leached *F. excelsior* embryos

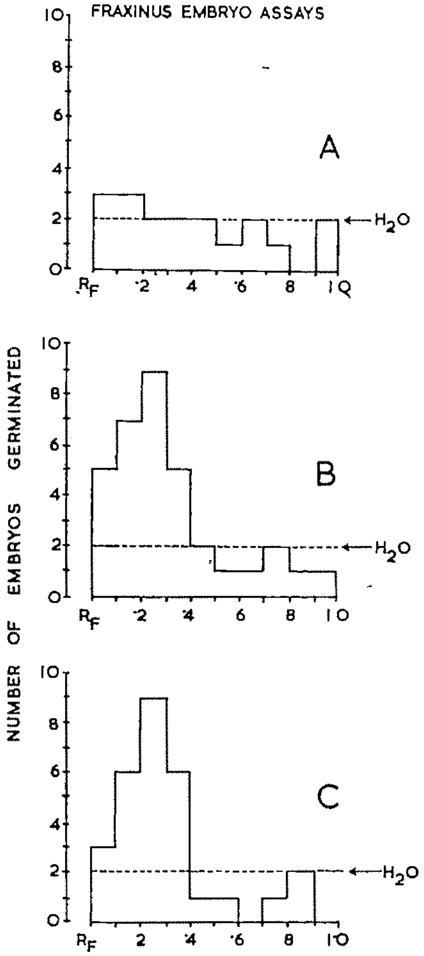

Fig. 2. Effect of aqueous embryo extracts on germination of unchilled embryos. *A*, Extract of unchilled embryos; *B*, extract of chilled, non-germinating embryos; *C*, extract of chilled, germinating embryos

Thiourea has the property of counteracting the effect of the inhibitor on the germination of lettuce seeds. Excised unleached (dormant) embryos of *F. excelsior* germinate readily if placed on filter paper moistened with 0·5 per cent thiourea solution, but no reduction in the level of inhibitor can be detected within the embryos.

As chilled embryos are able to germinate without leaching or thiourea treatment, and the process of chilling does not decrease the inhibitor content of endosperm or embryos, it was decided to investigate the possibility of the production of a germination-promoting substance. As no such substance could be demonstrated using the coleoptile straight-growth

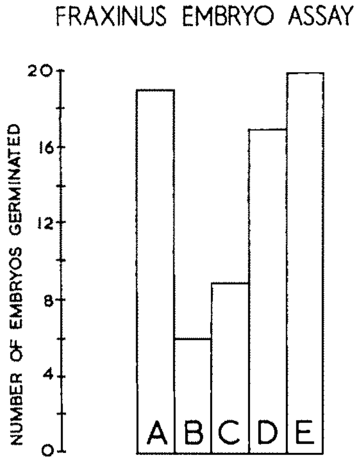

Fig. 3. Interaction between inhibitor and germination promoter. Leached, unchilled embryos on filter paper moistened as follows *A*, water only; *B*, inhibitor only; *C*, inhibitor + eluate from zone R_F 0·15–0 35 of extract of unchilled embryos; *D*, inhibitor + 0 5 per cent thiourea; *E*, inhibitor + eluate from zone R_F 0 15–0·35 of chilled embryos

Note.—Embryos from *A* produced stunted seedlings, those from *D* would not grow further, those from *E* produced normal seedlings

technique, unleached (dormant) embryos of *F. excelsior* excised from unchilled seeds were used in place of the coleoptile sections in biological assays. It was found that the zone R_F 0·15–0·35 in chromatograms of aqueous extracts of chilled, and of chilled germinating embryos, stimulated the germination of the dormant assay embryos within three days. This zone of stimulation was shown not to be present in extracts of unchilled embryos (Fig. 2), nor in the endosperms of seeds at any stage of after-ripening or germination.

That this germination-stimulating substance has the property of counteracting the effect of the inhibitor was demonstrated by the following experiment. The inhibitor-containing zone of a chromatogram (R_F 0·6–0·8) was cut into four strips and the strips moistened separately in Petri dishes with: (*a*) distilled water as a control; (*b*) eluate from zone R_F 0·15–0 35 from a chromatogram of extract of 10 unchilled embryos; (*c*) 0·5 per cent thiourea solution; (*d*) eluate from zone R_F 0·15–0·35 from a chromatogram of extract of 10 chilled embryos. A further control of filter paper moistened with distilled water (that is, no inhibitor) was prepared. Twenty unchilled, leached (non-dormant) embryos were placed in each of the above five dishes. It was found that there was little growth in the dishes containing either inhibitor alone, or inhibitor plus eluate from unchilled embryos, whereas in the dishes containing inhibitor plus eluate from chilled seeds, inhibitor plus thiourea, and distilled water alone, full germination took place within four days (Fig. 3).

The subsequent growth of variously treated embryos was investigated. Seedlings grown from excised chilled embryos, and excised unchilled embryos treated with the germination stimulator extracted from chilled embryos, were apparently normal when compared with those produced from normally germinated after-ripened seeds. Seedlings produced from unchilled embryos, germinated after leaching in water, were stunted, and embryos treated with thiourea did not produce seedlings, even after washing to remove excess thiourea.

Tests in which embryos in various stages were treated with synthetic gibberellic acid have shown that although the dormant embryos can be stimulated to germinate slowly by treatment with this substance, nevertheless the stunting of seedlings grown from unchilled embryos is not removed by gibberellic acid. It would seem, therefore, that the germination promoter is not gibberellic acid, a conclusion which is supported by the fact that small amounts of tissue may be used for extraction, in contrast with the large amounts used for the demonstration of natural gibberellins.

The fact that the inhibitors and germination stimulator may be detected by the embryos in which they occur naturally is good evidence that the results obtained *in vitro* reflect actual changes within the after-ripening seed. The evidence obtained suggests that the deep dormancy of seeds of *F. excelsior* is imposed by the presence of growth inhibitors in both endosperm and embryo During chilling, this dormancy is overcome by the production of a germination-stimulating substance in the tissues of the embryo.

A detailed account of the experimental work will be published elsewhere.

Effects of Gibberellic Acid on Excised Pea Roots

IN the course of an investigation of inter-varietal differences in the growth of excised roots of field peas (*Pisum sativum* L. var. *arvense*), some effects of gibberellic acid have been observed which seem worthy of brief record. Seeds were surface sterilized with 0·1 per cent mercuric chloride and germinated for two days. Root tips (5 mm.) were excised and grown in the dark at 25° C. in Petri dishes containing the inorganic medium of Bonner and Addicott[1] with 4 per cent sucrose, vitamin B_1 (0·1 mgm./l.) and nicotinic acid (0·5 mgm./l.). Ten tips were employed in each treatment, two being grown in each dish. After seven days the roots were measured and the apical 10 mm. of each was transferred to fresh medium for a further week.

Roots of the variety Minerva Maple grew extremely well (Table 1) and, so far as is known, no other variety of either field pea or garden pea has been found to grow as rapidly under similar conditions. By comparison, the growth of the variety Winter Maple was poor and it decreased markedly in the second passage. Gibberellic acid did not influence the growth of Minerva and in this respect this variety behaved in a similar way to the roots of intact cress seedlings[2]. With Winter Maple on the other hand, 0·5 and 25 mgm./l. gibberellic acid caused significant though small increases in growth in the first passage. The lower concentration stimulated growth again in the second passage but the higher concentration gave no stimulation. When seedlings of Winter Maple, which

Table 1. EFFECTS OF GIBBERELLIC ACID ON EXCISED ROOTS OF MINERVA MAPLE AND WINTER MAPLE

Variety	Concentration G A (mgm./l)	Length of root (mm)	
		Passage 1	Passage 2
Minerva Maple	0	77·6 ± 7·0*	87·5 ± 10·0*
	0·5	71·8 ± 4·0	90·6 ± 7·7
	25·0	89·0 ± 8·7	83·5 ± 9·5
Winter Maple	0	41·9 ± 1·8	15·7 ± 2·1
	0·5	48·8 ± 2·5	25·8 ± 1·1
	25·0	46·7 ± 1·7	14·7 ± 2·1

G.A , Gibberellic acid. * Standard error

is not a dwarf variety, were grown in an inorganic medium the roots grew much more rapidly than the excised roots in sterile culture. The above results may indicate that one of the factors limiting the growth of the excised roots of Winter Maple is a gibberellic acid-like substance.

The most striking effect of gibberellic acid on the excised roots, however, was on the development of root hairs. In most plants, root hairs are formed much more readily in moist air than in water[3]. In excised pea roots some hairs form on the tissue of the inoculum but the major part of the root is normally hairless. However, in the presence of gibberellic acid root hairs continued to develop in an acropetal manner, the youngest occurring on the tissue which had just completed extension growth. The covering of hairs was considerably denser at 25 mgm./l. than at 0·5 mgm./l. In Minerva the hairs were quite normal in appearance. In Winter Maple the hairs were shorter than in Minerva and at the higher concentration of gibberellic acid they tended to swell at the tip, the region of the hair which is generally believed to exhibit the greatest plasticity[3].

That gibberellic acid stimulates the normal development of hairs on excised roots raises the possibility that substances of this type may participate in the formation of these structures in intact plants.

The seeds employed in this work were kindly supplied by the Plant Breeding Institute, Cambridge.

Reversal of Genetic Dwarfism in *Tephrosia vogelii* by Gibberellin

IN conjunction with a breeding programme designed to produce plants of *Tephrosia vogelii* Hook f. with a higher rotenone content, multiple crosses were made between two lines of similar morphology, but of separate geographical origin. Nine dwarf plants were obtained as segregants in an F_2 population of 103 individuals. These dwarfs were characterized by greatly reduced internodes, hypocotyls, petioles, and rachises. Leaflets were also much smaller, and leaf colour was a darker green than normal. The number of leaves per plant, the number of leaflets on corresponding leaves, and the size and colour of the cotyledons were unaffected.

The potassium salt of gibberellic acid in an aqueous solution of 100 p.p.m. was applied in the form of a light spray to three of the dwarf plants. Three additional dwarf plants were sprayed with indoleacetic acid at 100 p.p.m., and the remaining three were sprayed with water as a control. The initial applications were made approximately one month after germination, and an additional spraying was given one week later. After responses to gibberellin were noted, two of the plants in this treatment were withheld from further applications, while one plant continued receiving weekly treatments of gibberellin.

Elongation of the petioles, rachises and leaflets was observed one week after the initial application of gibberellin. Leaves and internodes which had elongated prior to treatment were unaffected. Two weeks after the initial treatment with gibberellin, the three plants showed elongated internodes and leaves which were identical in appearance to those of normal seedlings. Normal growth continued in the plant which received additional periodical treatments of gibberellin. In those plants which were withdrawn from the gibberellin treatment after two applications, the dwarf condition reappeared gradually, and one month after the last treatment the plant was indistinguishable from the dwarf controls except for the elongated stem produced during the period of gibberellin treatment. These results indicate that the dwarf segregants of *T. vogelii* are completely dependent on periodic applications of gibberellin for normal growth.

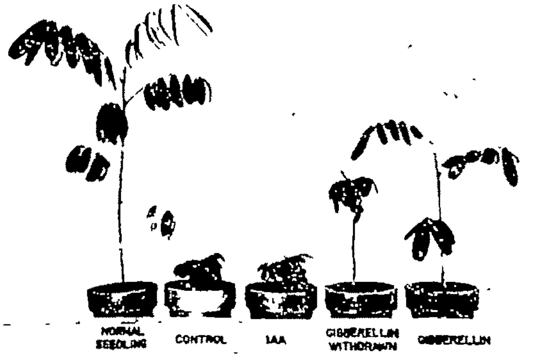

Fig. 1. Seedlings of *Tephrosia vogelii* Hook f showing a normal F_2 seedling, an untreated dwarf segregant, a dwarf treated with indoleacetic acid, a dwarf treated and then withdrawn from gibberellin, and a dwarf on continued gibberellin treatment

There was no growth response in plants treated with indoleacetic acid when compared to the controls. Fig. 1 shows (from left to right) a normal seedling of *T. vogelii*, an untreated dwarf segregant, a dwarf treated with indoleacetic acid, a dwarf treated with gibberellin for two weeks and then withdrawn, and a dwarf which has continued to receive periodical applications of gibberellin. A similar reversal of genetic dwarfism in other legumes[1] and in maize[2] has been reported.

We are indebted to Merck Sharp and Dome International, Rahway, New Jersey, for supplying the gibberellin used in this study.

BIOLOGY

Water Hyacinth : a Curse or a Crop?

An organism often multiplies explosively when carried to a new environment. Rabbits in Australia are a familiar example, and now we have water hyacinth (*Eichornia crassipes*) in south-east Asia, the Nile, and the Congo[1-3]. In time, enemies of the invader will probably evolve in the new environment, or be introduced into it, and restore a balance, but that may take many years. In the meantime, there is disruption of old patterns of life and effort is therefore put into attempts to eradicate the invader and restore the *status quo*. This is obviously wise, but it is by no means certain that eradication will be successful, so that it may be prudent to try to find how best to live in the new circumstances. The invader may often be useful.

The main disadvantages of working with a weedy crop, or with wild vegetation, are that there is competition and products are harvested with widely different properties and potentialities. They would be useful separate but not mixed. Water hyacinth produces a pure stand. Acres of water that hitherto carried little plant-life now carry a rich growth. This makes the plant resemble a crop rather than a weed and raises a fundamental issue. Hitherto, agricultural research has been based on the idea that we know what crops we want and then grow them in increasing abundance in increasingly exacting environments. Biochemical engineering introduces the opposite outlook : it strives to find what an area will produce most abundantly and then looks for a use for it[4].

A floating plant is ideally adapted for mechanized harvesting but possible uses for water hyacinth have not been intensively sought. Cattle will eat it, as Davies[3] pointed out, and Hora[5] describes its use as pig food in south-east Asia. It has been fermented to give methane[6] and compost[7]. When harvested it contains 95 per cent of water. This is a disadvantage for many uses, but is a great advantage if it should prove possible to use the leaf as a source of extracted protein, because general experience suggests (cf. ref. 8) that protein extraction is easier from wet than from dry leaves. Leaf protein extraction is now being studied in several places with many different types of leaf, but the basic principle of extraction is always the same and is very simple[9] ; the fresh leaf is pulped and the juice, neutralized if necessary, is separated. It carries with it much or most of the protein, and this is coagulated and filtered off as a dark green cake which generally has little flavour after washing with water. It can be used as it stands in various dishes that are reasonably palatable[10], or a stable protein can be made by extracting the chlorophyll and lipids with a solvent. So many species have now given satisfactory yields of protein that there is good reason to expect that it could be extracted from water hyacinth. But this has not, apparently, yet been demonstrated.

This communication is a plea for some re-orientation of thinking in areas suffering from, or threatened with, water hyacinth. There is a case for directing some research towards finding uses for the pest instead of concentrating all efforts on its eradication. The practicability of those mentioned here has not been established and difficulties may arise with some of them. But the quantity of water hyacinth is now so large, and so much effort is already being put into dragging it from waterways, that it would seem reasonable to set up a unit to study all the possibilities.

Chick Feeding in the Wandering Albatross *Diomedea exulans* Linnæus

It has long been known that the young of the wandering albatross (*Diomedea exulans*) do not fly until eight or nine months after hatching, and the problem of how this long fledgeling period fits into the breeding cycle of the adults has caused some speculation among naturalists acquainted with the species[1-6]. Excellent descriptions are available of the birds at sea and on the breeding grounds, but it is only recently that detailed study within a large population has been undertaken[7].

As early as 1929 it was suggested that individuals of the species may not breed each consecutive season because of the necessity of feeding the young throughout their first winter[1]. Such a phenomenon was held by Murphy[2] to be highly improbable. It was maintained that the only hypothesis consistent with the few other available winter observations at breeding stations[8] was that the chicks, after being fed for the first three or four months, were deserted by their parents, who departed to sea to prepare for the following breeding season. The nestlings, it was stated, went for the last four months, throughout their first winter, without feeding but surviving off stored body reserves of visceral and subcutaneous fat until fully fledged and able to leave the nesting grounds, shortly after the adults had returned again to breed.

Studies of the related royal albatross (*Diomedea epomophora*) have since demonstrated a bi-annual breeding cycle in which the young are fed throughout the fledgeling period of 236 days[4]. Since Matthews's original description[1], winter feeding in the wandering albatross has been noticed at three other stations. In the Antipodes Islands eight-month-old chicks were receiving meals[9] and at Kerguelen feeding has been seen during August and September[5]. On Gough Island, adults were observed with eight-month-old chicks some time before the return of breeding birds[10].

Recent workers at South Georgia[7] spent five months in the field during October 1958–March 1959, most of it on Bird Island 54° 00′ S. ; 38° 02′ W., the densest breeding ground of the wandering albatross in the world.

The albatross returns to South Georgia in mid-November ; but before the return of the main body of breeding birds single adults were observed paying brief visits to nestlings of not more than 10 min. duration. Banding operations began at Bird Island on November 26 and during the following month 656 nestlings were banded. In the course of this work, nestlings being handled frequently regurgitated large fresh meals and the sight of adults feeding young was fairly common. There is no direct evidence that these adults were in fact feeding their own young; but nestlings were often seen begging from adults which refused them. Conversely, there is no indication in the royal albatross that adults feed random chicks[4].

In adult wandering albatrosses there is a significant difference in body-weight between the sexes, but at the time of departure the few young examined were not necessarily lighter or heavier than the adults. The range of body-weights in twelve juveniles a few days before leaving varied between 5·6 and 11·3 kgm. while that of 105 adults of both sexes was 6·35 to 9·15 kgm.

Table 1. WEIGHTS OF ADULT WANDERING ALBATROSSES, BIRD I

Sex	No	Mean (kgm)	Standard deviation (kgm.)	Standard error (kgm)	Range (kgm.)
Male	52	9·11	0 60	0 083	8 20–9 15
Female	53	7 27	0 52	0·071	6 35–7 30

The lightest of the juveniles had been losing weight at the rate of 95 gm./day during the preceding twelve days while the mean daily loss of the heaviest over eighteen days was 200 gm./day (Fig. 1). The combined mean daily loss in four juveniles during the three weeks preceding departure was 162·5 gm./day (No. 64, *S.D.* 3·30, *S.E.* 0·412, range 1–650 gm.).

Thus a young albatross leaving the breeding grounds in December with a flight weight of 9 kgm. must, if it had fasted the whole winter, have weighed over 23 kgm. the previous July—more than twice the body-weight of an adult male. Rankin[3], calculating from daily weight increments of four chicks in the month following hatching, estimated that the weights at the end of June would be between 30 lb. 12 oz. and 25 lb. 13 oz. (13 9–11 8 kgm.). In comparison with adult weights these appear to be reasonable estimates, but they are strictly comparable with those of fully fledged juveniles preparing to depart in December. Thus they are no evidence for the hypothesis that they are put forward to support, rather the reverse, for young albatrosses of such peak weights would not have survived a winter without fairly regular feeding.

The young of most of the procellariiformes reach peak weights in excess of the parent body-weights.

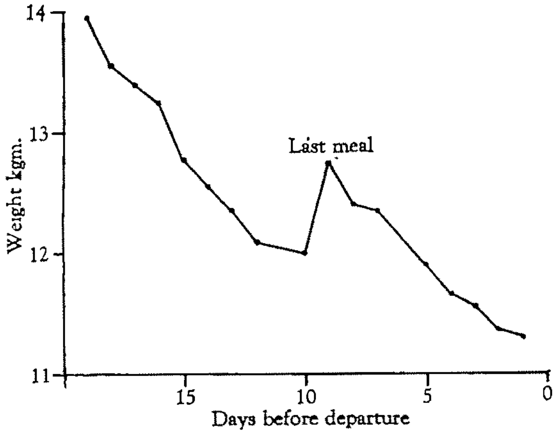

Fig. 1. Weight of a young wandering albatross during its last weeks at the nest

In some species there may be desertion by adults but recent studies have demonstrated that it is more usual for the young to lose surplus weight during the latter part of the fledgeling period while they are still being fed[4,11–15]; although this feeding is less frequent than during the earlier part of the chick period.

While nothing can yet be deduced of the feeding regime of the wandering albatross, the evidence now available clearly indicates that the young are fed throughout the fledgeling period. The 'starvation' hypothesis is therefore untenable and it must be held that the wandering albatross, like the royal albatross, breeds only once every two years.

Hydrophilic Gels for Biological Use

PLASTICS to-day enjoy wide use in many fields, and it is natural that the possibility of their employment in permanent contact with living tissues has been seriously considered. A study of the literature shows that almost all known plastics have been proposed for this purpose at various times. The question of structural similarity with the tissue has not, however, been emphasized although physiologically unfavourable effects were observed in most cases of application of normal type plastics.

The extensive application of plastics for alloplastic and prosthetic uses requires solution of the problem of compatibility of the material with the live tissue. It is indisputable that non-biological material represents a foreign body having contact surfaces showing large deviations from normal physiological behaviour.

The result of poor compatibility is either an immediate severe local irritation or a tumorous growth which sometimes appears only after a longer interval The cause of these phenomena, as has been ascertained, is to be found among other factors in the mechanical irritation or in the long-term slow diffusion of low molecular irritant substances from the plastic itself, so that every plastic must be judged from this point of view. All high polymers used so far in medicine are impermeable to metabolites. The majority of them are hard solids so that they can cause mechanical irritation. Further, one must expect a certain slow leaching of irritating substances from them. Polyvinyl alcohol is an exception; but it has the major disadvantage that it is absorbed.

The demands to be placed on a suitable plastic after consideration of the above-mentioned effects are thus: (1) a structure permitting the desired water content; (2) inertness to normal biological processes (including resistance to the degradation of the polymer and to reactions unfavourable to the organism); (3) permeability for metabolites.

Materials with these properties must have hydrophilic groups. Further, they must have a three-dimensional structure with at least enough cross-linkages to prevent absorption.

Of a large number of plastics we found co-polymers of glycolmonomethacrylate with several tenths per cent of glycoldimethacrylate to be the most suitable. They hydrolyse only with difficulty, even under severe conditions, and are indifferent to biological materials. A further advantage is that their mechanical properties and water content can be adjusted to meet requirements. They withstand heat sterilization without damage.

Hydrophilic materials of a marked polyelectrolyte character (with basic groups, or with carboxyl groups) have unfavourable effects on the organism, swell excessively and their chemical stability does not attain the stability of glycol esters.

Gels based on glycolmethacrylates are also noteworthy for their transparency (in the case of polyglycolmonomethacrylate with a water content less than 30 per cent and with the higher glycols at all concentrations). The water content, and thus the shape of the object, is, after attaining equilibrium at the given temperature, constant and depends on the structure and number of cross-linkages. The appropriate monomers can be prepared by the alcoholic re-esterification of methylmethacrylate with glycol followed by selective extraction of the di- and mono-esters from the reaction mixture. The desired shapes are prepared by polymerization of aqueous solution in suitable moulds. Rubber-like and soft gels can be stiffened by polyamide fibres either in the form of flock or threads. Before use it is necessary thoroughly to leach out the shapes.

The formation of a porous structure by the rapid polymerization of glycolmonomethacrylate is of great interest. With a water content greater than corresponds to the equilibrium capacity of the gel, a porous structure will arise by coalescing of the water-phase droplets into interconnected channels. The size of the pores depends on the polymerization conditions. On drying the porous sample, a transparent solid material is formed which takes on the original shape and structure on immersion in water.

After embedding in the living organism they do not show any irritating reactions as do other materials. Histological sections show successful encapsulation of the inserted object. Detailed biological results will be published in due course.

After more than four years of testing, these materials have now passed through the stage of application such as filling after enucleation of the eye. Promising results have also been obtained in experiments in other cases, for example, in manufacturing contact lenses, arteries, etc.

Origin of Placental Trophoblast

IN 1949 I published a hypothesis suggesting that the cyto- and syncytio-trophoblast were derived from the granulosa cells that surround the egg when it leaves the ovary; the argument, however, depended on indirect evidence, and although this indirect evidence has further accumulated it is not proposed to discuss it here[1].

Since then the work initiated by Barr and Bertram[2] on the nuclear sex chromatin has provided an opportunity to test the hypothesis. Obviously, if the trophoblast is fœtal its sex will always correspond with that of the fœtus; if it is maternal it should always be female. Workers have studied the normal placenta, chorionepithelioma and the hydatidiform mole. With respect to the normal placenta it must be recognized that my hypothesis refers only to the syncytium and the cytotrophoblast, and when this latter tissue disappears, only to the former. Other tissues in the placenta, such as those forming the vascular and supporting structures of the villus and cells derived from the outer covering of the blastocyst (chorionic epithelium), are undeniably of fœtal origin, and perhaps the last-named tissue also gives rise to cells that may equally in current usage be called cytotrophoblast. The only valid evidence, therefore, will result from sexing of the syncytium.

Park[3] worked on the embryos in the Carnegie Institution. His slides were old and not specially stained. He claimed that the trophoblast was always of the same sex as the fœtus; but when certain syncytial cells were female when they should have been male, he argued that these particular ones must have been derived from maternal stroma blending with developing trophoblast.

Klinger[4], Parmentier[5], Stevenson and McClarin[6], Bohle and Hienz[7] either did not examine the syncytium or found it unsuitable for study.

With respect to chorionepitheliomata Park[8], Oosterhuis and Levy[9] seem to have ignored the syncytium and the former suggests that trophoblast of chorionepitheliomata may not show any reliable sex difference.

Klinger and Ludwig[10] have recently described a more satisfactory method of staining the sex chromatin body and have applied it to the hydatidiform mole[11]. The results are interesting, for of nine moles examined all were female. The authors, in explanation, suggest (1) only female embryos develop moles; (2) there may have been a nuclear change, that is, the nuclei of the mole were polyploid, or (3) moles are derived from the maternal tissues. The first two explanations cannot be correct, for one of their moles developed with a male embryo, and Klinger and Schwarzacher[12] state that polyploid male nuclei (even $8n$) only occasionally show a sex chromatin mass and even so it is distinguishable from the average female diploid. The third explanation, and in my view the correct one, they do not elaborate.

In view of the results of experiments on homotransplantation it is strange that the syncytiotrophoblast is accepted so readily as of fœtal origin. Medawar[13] initiated the work showing that homotransplants do not take if the donor and recipient are not of identical genetic constitution, and the human mother and fœtus are generally not so identical. Tolerance can be produced in mice to homologous skin grafts only by manipulations in the recipient around the time of birth[14]. The human mother has not only more highly developed immunological processes but also can in no sense be considered new-born, or a twin of the fœtus. Medawar suggests that the mammalian fœtus is usually protected from the consequences of homotransplantation as it has its strictly independent circulation. However, the human syncytiotrophoblast has a relationship with the maternal circulation that could not be closer. Algire *et al.*[15] can grow homografts indefinitely by inserting such into containers that prevent vascularization by the host and entry of cells. May the syncytium be Nature's analogue to Algire's millipore filter ?

It appears thus that the normal syncytium and the chorionepithelioma are difficult to sex but that the hydatidiform mole is female. It is considered that this supports my earlier suggestion that the syncytium is derived from granulosa cells, and its function is to protect the fœtus from the immunological processes of the mother.

Influence of Filming and of Surface Texture on the Settlement of Marine Organisms

WHEN a well-cleaned surface is allowed to stand in sea water it becomes coated with a film in a few hours. The film increases in thickness for at least the first few days after it has formed. Several reports are to be found in the literature of a filmed surface being more favourable to settlement than a freshly cleaned one[1-4]. It has been widely assumed that this is true for all marine larvæ, since a permanent surface suitable for settlement is bound to collect a film in the sea. The extreme view has indeed been expressed that filming may be a necessary pre-requisite to the attachment of marine larvæ, although larvæ of some sedentary organisms have been observed to attach themselves to newly submerged surfaces before any visible film has formed[2].

A second assumption frequently made is that marine larvæ will attach themselves to a roughened surface more readily than to a smooth one.

Both these assumptions are being currently tested on a variety of invertebrate larvæ. Small rectangular pieces of chemically inert material are used, the upper surfaces of which are prepared in a series of grades of roughness from a shiny glossy finish to a coarsely ground surface. The surfaces are filmed for periods of 24 hr. or more and arranged in a factorial experiment around the periphery of a cylindrical dish containing larvæ, and slowly rotated in order to equalize such external influences as uneven illumination, to which the larvæ might be susceptible.

Table 1. NUMBER OF LARVÆ OF *Spirorbis borealis* AND OF *Bugula flabellata* SETTLING ON EQUAL AREAS OF PREPARED CHEMICALLY INERT SURFACES

Type of surface texture	*Spirorbis borealis*			*Bugula flabellata*		
	Filmed	Clean	Total	Filmed	Clean	Total
Glossy	826	23	849	175	967	1,142
Smooth but dull	273	239	512	93	1,327	1,420
Rough	1	0	1	88	960	1,048
Very rough	11	0	11	54	596	650
Totals	1,111	262	1,373	410	3,850	4,260

Our experiments, which will be fully reported elsewhere, have already shown that neither of the above generalizations is valid. The larvæ of many organisms settle preferentially on smooth rather than on rough surfaces, while others are indifferent to surface texture. Furthermore, although the majority of larvæ appear to choose a filmed surface, those of one species at least, *Bugula flabellata*, settle more readily on a clean unfilmed surface than on a filmed one. Moreover, we have verified that the film eschewed by *Bugula flabellata* was not a film of an accidentally unfavourable character, since it simultaneously attracted the larvæ of another animal, *Spirorbis borealis*, known for some time to prefer filmed surfaces[3]. The two kinds of larvæ in roughly similar numbers were placed together in a dish containing a series of surfaces, both filmed and unfilmed. As can be seen from the results in Table 1, larvæ of *Spirorbis* were attracted but those of *Bugula* were repelled by the film. Furthermore, *Spirorbis* larvæ clearly avoided the rougher surfaces, while *Bugula* larvæ were almost indifferent to surface texture.

It seems clear that a considerable diversity of behaviour towards films exists even in these simple ciliated larvæ ; they seem able to respond both to the form of the surface and also to the presence or absence of a film overlying it. Further work may well show that many of them can distinguish qualitatively between films, as the larvæ of *Ophelia bicornis* appear to do[4]. No simple generalizations therefore seem applicable to the reactions of settling larvæ on filmed surfaces.

Elminius modestus Darwin on the Isle of Cumbrae (Firth of Clyde)

THE distribution and rate of spread of the immigrant intertidal barnacle *Elminius modestus* Darwin in the British Isles and in the rest of north-west Europe have been summarized recently[1]. The most northerly published record is that of Connell[2], who found a single specimen of *Elminius* on Farland Point, Isle of Cumbrae, on March 7, 1955 ; the nearest published records to this are those for Stranraer and Kirkcolm in Loch Ryan[1], about 55 miles to the south.

In view of the interest attached to the well-documented[1] rate of spread of this barnacle, search has been made at intervals since 1955 for further specimens on the Isle of Cumbrae; but none was seen until September 3, 1959, when two specimens were found on the exposed tip of Keppel Point, about 525 m. north-east of Connell's find. The two *Elminius*, which were left *in situ*, had settled about 3 m. apart, near mean tide-level, on rock among large *Balanus balanoides*; both specimens were small (3·5 and 3·6 mm. mean diameter, September 29) and presumably had settled during the summer of 1959.

Since it is believed that cross-fertilization is obligatory in *Elminius* and that in consequence individuals separated by a distance exceeding 5 cm. cannot breed[1], much larger settlements are required before the species can become fully established here.

Mass Rearing of Barnacle Cyprids in the Laboratory

Interest in laboratory experiments on ships' fouling organisms is increasing, yet attempts to rear barnacle larvæ to cyprid stage have generally met with only limited success[1–6]. It therefore seems appropriate to place on record a reliable rearing method, which has been developed here to provide material in connexion with experiments on the use of ultrasonic antifouling equipment. The barnacle mostly used was *Elminius modestus*, as this important fouling organism produces nauplii all the year round. As a result of many series of experiments the following simple technique was evolved.

All sea water used is first pasteurized by heating to 60° C. and then cooled to room temperature. Masses of ripe embryos are dissected out of adult barnacles and placed in a dish of sea water on the side remote from the light. Stage I nauplii soon hatch from a proportion of the egg masses and swim rapidly to the lighted side of the dish, tending to leave behind Protozoa that may have been introduced with the egg masses. From the lighted side the nauplii are pipetted into 1 or 3 l. 'Pyrex' Berzelius beakers of sea water to give a larval density not exceeding 300 per l. *Skeletonema costatum* (Plymouth Collection No. 106), cultured in standard Erdschreiber medium[7], is used as food. Actively growing culture is added at a density of 200–500 cells per mm.^{3} at the beginning of the experiment. The diatoms tend to settle to the bottom, but gentle stirring with a glass rod once a day is generally found to resuspend them sufficiently, particularly as the nauplii are able to feed on them while they are on the bottom. The vessels are covered and kept on a laboratory bench where they receive north daylight. No change of water or vessel is carried out and growth of the food plant usually makes good the quantity consumed, but excess food should always be present and more diatoms are added whenever necessary. Considerable fluctuations of temperature are tolerated. At a temperature of about 22° C. cyprids of *Elminius* appear after six days and have been obtained at all months of the year.

More than 90 per cent of the stage I nauplii eventually reach cyprid stage in such a culture and 80 per cent or more of these settle if provided with a suitable substratum. These figures contrast with the overall survival to the settled state of 16·3 and 12·7 per cent recently reported for individually reared larvæ of *Balanus eburneus* and *B. amphitrite* var. *denticulata*, respectively[4,5]. The main reasons for the failure of previous workers to obtain consistently high yields are probably contamination of cultures with other organisms, especially ciliates, overcrowding or stale or wrong food.

Although gentle bubbling of air from a glass jet has often been used to help keep the food suspended, careful experiments show that results with *Elminius* in bubbled vessels are no better than in stagnant cultures where satisfactory conditions have been established. There is thus no support for the idea recently put forward[8] that agitation of the water is necessary for ecdysis to be successful. Similarly, penicillin and streptomycin, which have been recommended in culturing oyster larvæ[9], do not produce significantly better results when added to healthy cultures, although they help in poor culture conditions where many larvæ have died.

Besides *Elminius* the cyprids of *Verruca stroemia*, *Chthamalus stellatus*, *Balanus amphitrite* var. *denticulata*, *B. perforatus*, *B. balanoides*, *Acasta spongites* and *Pyrgoma anglicum* have all been reared in large numbers. The larvæ of the two latter species are being described. Other plant cultures have been used as food with varying success and their relative values are being tested. Already it is clear that *Elminius* grows and survives better when fed on *Skeletonema* than on *Phaeodactylum*. Japanese workers have also found *Skeletonema* suitable as food for barnacle larvæ[10]. *Chthamalus stellatus*, however, though capable of being reared satisfactorily on the small flagellate, *Isochrysis galbana*, has not been reared successfully on *Skeletonema* and therefore seems to show a difference from Balanidae with which the fine setulation of the larval limbs in *Chthamalus* is probably correlated. The use of liver or egg extract as food[11] has not been tried, but would obviously need a procedure entailing frequent water changes to remove decomposing food.

I am grateful to the Marconi International Marine Communication Company, Limited, for financing this research, to Dr. Mary Parke of the Marine Laboratory, Plymouth, for supplying the plant cultures and to Prof. E. W. Knight-Jones for his advice and criticism.

Terrestrial Ostracods of New Zealand

TERRESTRIAL ostracods have been known since 1953 from South Africa when Dr. R. F. Lawrence found specimens of *Mesocypris terrestris* Harding, in the humus of the Knysna forest[1]. Although there is no published record they have been found on several occasions in New Zealand, also in forest litter. Specimens from Leith Saddle, Dunedin, have recently been extracted alive by slowly drying out litter in a Berlese funnel, with a water-jacket maintained at a temperature of 40° C. and with the end leading into water, not alcohol. The temperature must be low to prevent the ostracods closing their valves and remaining immobile, and this is probably the reason why they have been found so infrequently. The animals are easily kept alive in a small dish lined with moist filter paper, and with a few fragments of humus to provide food and shelter.

The New Zealand specimens also appear to belong to the genus *Mesocypris* Daday, but differ in several respects from other described species. The valves of the shell are of equal size. Typical dimensions are: length, 0·56 mm., and height, 0 28 mm., the colouring being pale lemon unevenly distributed. Two specimens of the fifty which I have seen are considerably larger, being as much as 1·04 mm. long and 0·62 mm. high. The colour is also different, with patches of light brown. No males have yet been found. There is a marked dorso-ventral flattening, and the shell is moderately hairy. The appendages are broadly similar to those of *M. terrestris* with well-developed claws and a reduced number of setæ. A full description will be published later.

Locomotion is by means of the second antennæ and the third legs, both of which are armed with claws at the tips. An extra leg, used also for balance in steep places, is provided by the two halves of the furca, which act together. The animals are capable of moving up and down vertical slopes of humus, and one specimen was seen to climb several centimetres up the smooth sides of a glass dish. The first antennæ are used for sensory perception and balance, and with the setæ spread out explore objects ahead of the animal. They maintain a constant up and down motion, each alternating with the other. Sudden intense illumination causes the valves to close while bright light leads to rapid wandering in search of shelter. It is surprising to find apparently normal eyes, as Harding states that *M. terrestris*, like most litter-dwelling animals, appeared to be blind.

The Dunedin specimens were collected in ordinary forest litter from podocarp-broadleaf forest on Leith Saddle at an altitude of 1,200 ft. in places of no more than ordinary dampness. Experiments in the laboratory have shown that they are able to survive quite marked drying-out. although their activity decreases considerably and they tend to remain in holes in the humus. On the addition of more water they emerge and are capable of moving with great speed. On the other hand total immersion does not harm them and they will survive for at least a week. It is interesting that terrestrial Harpacticoid copepods were also found in the same habitat.

Other specimens known to me have been collected from Mount Arthur at 3,200 ft. (J. T. Salmon; 1946), Stewart Island (R. K. Dell and B. A. Holloway; 1955), Mount Egmont in sub-alpine forest (M. P. Büchler; 1954), at the foot of Mount Burnett, Nelson (R. Chapman; 1956), beech litter from Silverstream (J. D. Stout), Little Barrier Island 800 ft. (A. Chapman; 1959).

Further studies are in progress on the ecology and distribution of this New Zealand terrestrial ostracod.

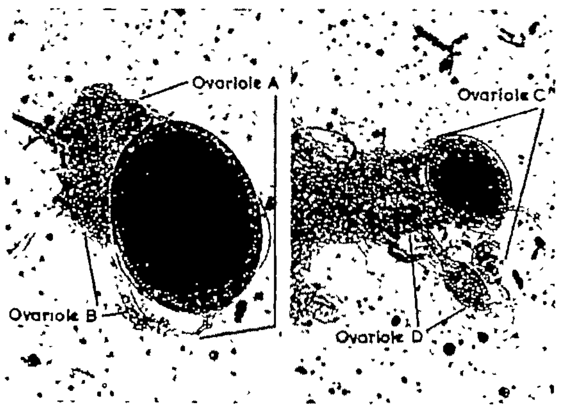
Ovaries of *Glossina morsitans*

CORRELATED with the viviparous type of reproduction found in the tsetse flies, the essential features of which were worked out as early as 1895 by Bruce[1], there is a great reduction in the number of ovarioles. Stuhlman[2] and Roubaud[3] studied the anatomy of the female reproductive organs and considered that each ovary consisted of a single ovariole, a view which has been perpetuated by every subsequent author. This communication, however, reports that in *Glossina morsitans* dissections have proved that each ovary contains, in fact, two ovarioles.

Dissections of teneral females were carried out in 0·9 per cent saline on a microscope slide. The ovarian sheaths were stripped off with a fine needle and the two ovarioles in each ovary released (Fig. 1, *a*, *b*). The slide was then drained of the excess saline and the ovaries mounted directly in a drop of polyvinyl-lactophenol containing a little lignin pink. This mountant produced a permanent preparation and avoided distortion of the ovarioles.



(*a*) (*b*)

Fig. 1. (*a*) Right ovary of a 24-hr.-old *Glossina morsitans*, dissected to show the two ovarioles. (*b*) Left ovary, ditto

In a study of the ovulation cycle of female *G. palpalis*, Helen Mellanby[4] showed that the first egg is ovulated from the right ovary, and the subsequent eggs alternately from left and right ovaries throughout the reproductive life of the fly. The cycles in *G. morsitans* and *G. swynnertoni* have been shown to be the same[5]. In the light of the fact that there is a total of four ovarioles, however, the ovulation cycle in *Glossina* requires a more detailed study. Fig. 2 shows the four ovarioles completely removed from the ovaries of a 24-hr. old female *G. morsitans*. The most advanced egg follicle is in one (*A*) of the two ovarioles in the right ovary; the ovum and yolk occupy about the lower third of the follicle. The

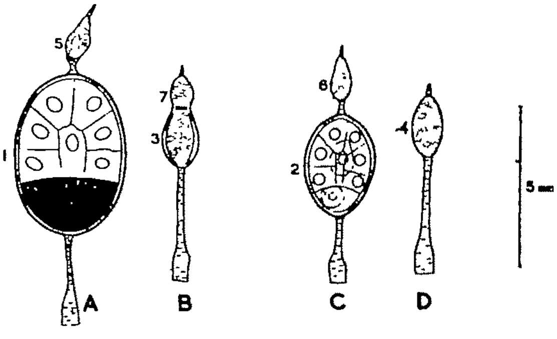


Fig. 2. The four ovarioles of a 24-hr.-old *G. morsitans*. Nos. 1–7: follicles in the order of development

next most advanced follicle is in one of the ovarioles (*C*) in the left ovary. This follicle shows only the beginning of yolk deposition. The second ovariole in the right ovary (*B*) shows the early stages in the development of its first egg follicle and the second ovariole in the left ovary (*D*) shows only the germarium and no signs of follicle development. From this appearance of the ovarioles in the newly emerged female it would seem that the general outline of the ovulation cycle as described by Helen Mellanby is true but must now be modified. The first egg is probably ovulated from ovariole *A*, the second from *C* and the third and fourth from *B* and *D*, respectively. The fifth egg produced will develop in the second follicle in ovariole *A*.

Further studies of the ovulation cycle in *G. morsitans* are in progress and will include those with particular reference to the state of the follicular tubes after ovulation.

VIROLOGY

Native Protein, an Immunizing Agent against Virus Infection

WITH several plant virus diseases, an infection, after becoming generalized, often results in apparent recovery of the plants, followed by an acquired immunity from reinfection[1]. The term, acquired immunity, has further been applied to the interference between virus strains in cross-protection tests.

The prevailing theory is that the virus particles are attached to 'acceptor points' in the plant cell[2]. Once these 'acceptors' are occupied no new virus particles of the same virus or related strains (requiring same 'acceptor') can multiply in the cell.

In this preliminary communication, a kind of immunization, apparently not due to antagonism of related strains, is reported.

Purified tobacco mosaic virus was prepared from tobacco plants, inoculated by a single lesion of common tobacco mosaic virus. The virus was purified by differential centrifugation[3]. This virus preparation, containing about 1 per cent tobacco mosaic virus, was degraded by Fraenkel-Conrat's method, using 67 per cent acetic acid[4]. Any undegraded virus was removed by ultra-centrifugation. The native protein obtained was tested on *Nicotiana glutinosa* L., and found to be free of virus particles.

In the first series of experiments half sides of detached leaves of *N. glutinosa* were inoculated with this native protein solution, freshly prepared, using 'Carborundum' as an abrasive. The other half of the leaf was similarly rubbed with water. The leaves were kept on moist filter paper, in Petri dishes. After varying intervals the whole leaves were rubbed with a diluted solution of tobacco mosaic virus; 'Carborundum' was again used. After 3–4 days lesions appeared and were counted separately for each half-side. Results, a mean of eight replicates, are summarized in Table 1.

Table 1. EFFECT OF NATIVE PROTEIN ON TOBACCO MOSAIC VIRUS INFECTION IN DETACHED LEAVES (AVERAGE OF EIGHT REPLICATES)

No. of inoculations with native protein	Tobacco mosaic virus inoculation, days after last protein treatment	No. of lesions in protein treated/untreated half-leaves	Ratios of lesion numbers in protein treated/untreated half-leaves (average)
1	1 hr.	52 : 46	1·15
1	1 day	52 : 56	0·96
1	2 ,,	60 : 81	0·79*
1	4 ,,	36 : 59	0·61*
2 (second after 24 hr.)	2 ,,	69 : 120	0·59*
,,	4 ,,	16 : 57	0·36†
2 (second after 2 days)	2 ,,	19 : 47	0·39†
,,	4 ,,	31 : 56	0·57*

* Significant at 0·05 per cent. †, Significant at 0·01 per cent.

Due to the extent of variation in lesion numbers within the replicates, the ratio between the two leaf half-sides was found to be much more constant, and was therefore used for statistical analysis.

As shown, no effect was found if the leaves were inoculated with tobacco mosaic virus either immediately or 24 hr. after the virus protein had been applied. The effect of the protein is more pronounced from two doses than from one, and increased somewhat after 4 days as compared with after 2 days.

In a second series similar results were obtained. The number of lesions and the ratio between treated and untreated half-sides varied; in some cases a ratio of even 1 : 9 in the protected leaf half-side was obtained.

In further experiments undetached leaves of *N. glutinosa* plants were treated. Each formula was tested on two plants—eight half-sides altogether. Protein and tobacco mosaic virus inoculations were conducted as described above. Results, a mean of eight replicates, are summarized in Table 2.

It should be added that the absolute number of lesions, as well as the ratio values, should be regarded cautiously, as the susceptibility of leaves and plants may vary. Nevertheless the striking effect of the proteins is clearly evident.

These preliminary results suggest the formation of 'protective substances' within the plant. As no

Table 2. EFFECT OF NATIVE PROTEIN ON TOBACCO MOSAIC VIRUS INFECTION IN UNDETACHED LEAVES (AVERAGE OF EIGHT REPLICATES)

No. of inoculations with native protein	Tobacco mosaic inoculation days after last protein treatment	No. of lesions in protein treated/untreated half-leaves	Ratios of lesion numbers in protein treated/untreated half-leaves (average)
1	1 hr.	38 . 37	1·12
1	1 day	46 : 39	1·20

2 (second after 2 days)	4 ,,	38 : 76	0 56†

* Significant at 0 05 per cent. † Significant at 0 01 per cent.

result was obtained when the protein inoculations were done immediately before tobacco mosaic virus infection, direct inhibiting effect does not seem to be the cause. A direct inhibiting effect of native protein, if mixed with tobacco mosaic virus before inoculation, is known to occur, but only in concentrated doses[6]. With dilute solutions as used in our experiments no inhibition could be observed[5].

The increase in the depressing effect observed after two protein applications, and after 4 days, as compared to 1 and 2 days, seems to suggest an analogy with antibody formation in animals.

Attachment of the protein to 'acceptor points' appears unlikely, as the protein itself does not reproduce. After infection the virus multiplies and establishes itself thoroughly before cross-protection is effective[7]. The initial amount of protein applied would, therefore, not be sufficient to produce this effect.

A full report will be published elsewhere.

Multiplication of Vaccinia Virus in Serum-free and Serum-containing Cell Cultures

THE use of tissue culture cells for the production of virus preparations and vaccines is increasing and will gain prominence in the future. A report has recently appeared concerning the possible use of cell cultures for the standardization of smallpox vaccines[1]. At present the cell lines used for the production of virus vaccines are grown in media which contain of necessity serum of one species or another[2]. Several cell lines which grow in media free of serum have been reported[3], and the advantages that these cells might have for vaccine production are obvious. Their use, however, could well be limited by their ability to support virus growth to a high titre. This report describes a comparison of vaccinia growth in serum-free and serum-containing mouse lung cells.

The cells used for growth studies were isolated from (new-born) white Swiss mice by the method of Younger[4]. The serum-containing line proliferated rapidly on a growth medium consisting of 10 per cent horse serum and 90 per cent medium 199[5]. The serum-free daughter culture was adapted to rapid growth on a medium in which the serum was replaced by 1 per cent Difco 'Bactopeptone' and 50–100 mgm. per cent dextrose[3]. The serum-containing line has been designated *MSI*, and the peptone line *MPDI*. At the time of use the *MSI* line was in its one hundred and twelfth passage (2¼ yr.) and the *MPDI* line in its sixty-fifth passage in peptone (1¾ yr.).

The vaccinia virus stock preparation strain *IDH–E*[6], which was normally maintained in chick embryos, was passed once in *MSI* or *MPDI* cells prior to experimental use. This was done to circumvent the possibility that any of the chick embryo protein might be carried along as a stimulatory factor when the virus was added to the cell cultures.

The *MSI* or *MPDI* cells were inoculated into a volume of 15 ml. of medium in 'Pyrex' milk dilution bottles, the total number of cells being approximately 3×10^5 (2×10^4 cells per ml.). After 48 hr. of incubation at 37° C. the cells were inoculated with 0·1 millilitre of a $1{\cdot}0 \times 10^{-3}$ dilution of the stock virus preparation. Immediately after inoculation, and every 24 hr. for a total of 8 days, 0·4 ml. of the supernatant fluid was harvested and stored frozen. Following the final harvest the virus was titrated by inoculating 0·1 ml. of a ten-fold dilution into each of 4, 16 mm. × 150 mm. test-tubes containing $2{\cdot}5 \times 10^5$ cells and 1 ml. of medium. The cell types used in this titration were, *MPDI*, *MSI* or N.C.T.C. clone 929 (strain *L*)[7]. The tubes were incubated at 37° C. at an angle of 5° and examined daily by use of a microscope. The titration end-point was considered as the final tube showing at least 20 per cent cell destruction within 10 days. The 50 per cent tissue culture infective dose ($TCID_{50}$) was then calculated by the method of Reed and Muench[8]. Plaques regularly appeared in 3–6 days in tubes which eventually showed the necessary cell destruction.

As an alternative method of titration, rabbits were inoculated intradermally with 0·1 ml. of the same ten-fold dilutions of virus. The end-point in this titration was taken as the highest dilution of virus eliciting an inflammatory lesion which progressed through pustulation and scar formation.

The results of a typical growth study are shown in Table 1. Only the titre of the 5-day harvest is shown, since the rate of growth was approximately the same in both cell lines. The maximum titre was usually reached on the fifth or sixth day, and the peak titre was maintained in both cell lines for at least 24 hr. The greatest amount of virus present in the peak titres in both cell lines averaged about 10 times higher than that previously shown with the Levaditi strain of vaccinia in serum-containing mouse lung cells[9].

It is apparent that cells grown in the absence of serum or its derivatives are able to support vaccinia multiplication to about the same degree as serum-containing lines. It also appears that serum-free cells are not as sensitive for the determination of

Table 1 MULTIPLICATION OF VACCINIA IN SERUM-FREE AND SERUM-CONTAINING CELL LINES. MAXIMUM TITRES

Virus grown in :	Negative $\log_{10}$ $TCID_{50}$ titre of virus titrated in : *MSI*	*MPDI*	*L*	Rabbits
MSI (serum)	6 3	6 0	6 5	6·3
MPDI (serum-free)	6 0	5 5	6 0	6·2

vaccinia infective titres as are serum-containing lines. This, however, may be related to the decreased stability of small numbers of virus particles in a non-serum-containing medium. The important point in this study is that the final titre of vaccinia is similar in both cell lines. After four passages in serum-free cells the virus has not yet shown a greatly diminished infectivity for rabbits as has been reported in other serum-containing lines[1].

Experiments are planned using other viruses in this same cell system. We are indebted to Dr. Wm. Cassel for provision of the vaccinia virus used in these studies.

SCIENTIFIC METHOD

A Proposal to replace Belief by Method in the Pre-mensural Sciences

NOT only in his posthumous work, "Fundamental Theory"[1], but also in many of his earlier writings, Eddington was concerned to define the mathematical structure of what he called a 'measurable', and to distinguish a measurable from an observable, and an observable from the most primitive entity, which he regarded as resembling a geometrical point except that, instead of having position only (a far from primitive attribute), it has existence (or non-existence) only.

Eddington's proposed algebraic representations of these three concepts can be translated into the language of communication theory as follows: an entity has two characteristics, existence and non-existence, and so can be represented by one binomial unit of information (bit). An observable is represented by two entities and has four characteristics, while a measurable is represented by two observables (or four entities) and has sixteen characteristics. This means that an entity has one way of not existing out of two possibilities, an observable three out of four, and a measurable fifteen out of sixteen.

We have devised[2] an information model which represents the concept of a 'comparable', intermediate between an observable and a measurable. A comparable is represented by three bits of information, has eight characteristics, and accordingly it has seven ways of not existing within this universe of discourse.

The information structure (called the O-structure, because it incorporates what is necessary for measuring or 'observing'—Eddington's Z) is a hierarchical structure. If the whole structure consists of n bits there will be $\frac{1}{2}n$ in the ground-level, $\frac{1}{4}n$ in the next, and so on for the L levels, where $L = \log_2 n$, the number of bits in any level, l, being $n/2^l$.

So long as a science is based upon measurables, its primitives must be measurable things, that is, atoms, but if a science is based upon comparables, this allows comparisons to be made between an observable entity, such as a semantic relationship with an observable, such as a physiological response. Luria's work[3] along these lines makes meaning observable, but not measurable in the physical sense, and so, in principle, separates meaning from knowledge in just the same way as the cybernetic engineer separates information from meaning.

It is suggested that these separations now make it possible to formulate a scientific methodology of pre-mensural science, based upon similarity and comparable with the formal methodologies of dynamics and wave mechanics in the mensural sciences.

We represent the primitive entity, first by the binomial unit of information for ideal representation, and secondly as a two-way switch, in order that this ideal representation can be exemplified, at least in principle, by a cybernetic artefact. This double representation has been found capable of representing some characteristics of neural events, but owing to the great complexity both of these events and of experienced events (memories) it is not to be expected that detailed isomorphism can be established. However, it is easy to show how a connected system of switches can represent what is required, at least in a general way. If we start by assuming that all the connected switches have an equal probability of being open or closed, that is, a half-probability of existence, this will represent a system in which information or probability flow is everywhere maximal and uniform. If we now consider that some instability creates a linked succession of switches in the closed position, this will represent maximal existence and zero information. Such a linking inevitably produces a number of informationally isolated systems of zero existence and zero information; such systems represent events that are not being experienced. If we adopt Eddington's proposal that numbers between 0 and 1 represent degrees of statistical existence (phase) this allows us to suppose slight imperfections in our two types of system. The linking of chains of switches in the state of maximal existence may be imperfect (synaptic gaps), and as regards the isolated events that provide the possibility of recognition, these may be supposed to accumulate sufficient information by similarity to reach what might be called a 'semantic threshold' as a unit entity. It is such a unit entity that we envisage as the third element of a comparable, the other two being provided, in the case of perception, by two micro-neural events or quanta that together constitute an observable.

FORTHCOMING EVENTS

Monday, January 11

Institution of Electrical Engineers, Electronics and Communication Section (at Savoy Place, London, W.C.2), at 5 30 p m.—Mr. G. G. Gourlet and Mr. G. F. Newell: "A Quadrature Network for Generating Vestigial-Sideband Signals"; Prof. D. G. Tucker: "The Input Impedance of Rectifier Modulators"; Mr. D. P. Howson and Prof. D. G. Tucker: "Rectifier Modulators with Frequency-Selective Terminations, with particular reference to the Effect of Even-Order Modulation Products".

Society of Chemical Industry, Surface Activity Group (joint meeting with the Oils and Fats Group, at 14 Belgrave Square, London, S.W.1), at 5.30 p.m.—Dr. C. G. Sumner: "Emulsions in Theory and Practice".

Manchester Literary and Philosophical Society (in the Reynolds Hall, Manchester College of Science and Technology, Sackville Street, Manchester), at 5.45 p.m.—Dr. G. E R. Deacon, F.R.S.: "Scientific Exploration of the Ocean" (Clayton Memorial Lecture).

Institute of Physics (at 47 Belgrave Square, London, S.W.1), at 6 p.m.—Prof. J. G. Wilson: "The Problem of Primary Cosmic Radiation".

Royal Geographical Society (at 1 Kensington Gore, London, S.W.7), at 8.30 p.m.—Mr. W. H. Melbourne and Mr. P. Garrard: "Explorations on the Bolivian–Peruvian Border".

Tuesday, January 12

Institution of the Rubber Industry (at the Royal Society of Tropical Medicine and Hygiene, Manson House, 26 Portland Place, London, W.1), at 5.30 p.m.—Mr. J. Westhead. "Chemical Plant Lining". 7 p.m.—Dr. J. N. Milne: "Hypalon Coatings".

Wednesday, January 13

Society for Applied Bacteriology (in the Barnes Lecture Theatre, Royal Society of Medicine, 1 Wimpole Street, London, W.1), at 9.45 a.m.—Winter Meeting. At 2.15 p.m. (joint meeting with the Microbiology Group of the Society of Chemical Industry)—Symposium on "Methods for the Evaluation of the Antibacterial Activity of Surface Active Compounds".

Bone and Tooth Society (in the Cuthbert Wallace Room, Royal College of Surgeons, Lincoln's Inn Fields, London, W.C.2), at 11 a.m.—Meeting on "Radioactive Materials and the Skeleton".

Physical Society, Low Temperature Group (in the Lecture Theatre of the Royal School of Mines, Prince Consort Road, London, S.W.7), at 4 30 p.m.—Dr. Audrey U. Smith: "Effects of Sub-Zero Temperatures on Living Cells, Tissues and Animals".

Institution of Electrical Engineers, Supply Section (at Savoy Place, London, W.C.2), at 5.30 p m.—Mr. E. C. Rogers and Mr. D J. Skipper. "Gaseous Discharge Phenomena in High-Voltage D.C. Cable Dielectrics".

Society of Chemical Industry, Corrosion Group (at 14 Belgrave Square, London, S.W.1), at 6 p.m.—Mr. J. N. Wanklyn. "Corrosion Problems of High Temperature Pressurized Water Reactors".

British Institution of Radio Engineers (at the London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, London, W.C 1), at 6.30 p.m.—Dr. G. T. Wright: "A Proposed Space-charge-limited Dielectric Triode".

Women's Engineering Society (at "Hope House", 45 Great Peter Street, London, S.W 1), at 7 p.m.—Mr. B. C. Godbold: "Health Physics and Nuclear Power".

Wednesday, January 13—Thursday, January 14

British Coal Utilization Research Association (at the Research Station, Randalls Road, Leatherhead, Surrey)—Symposium on "Aerodynamic Capture of Particles".

Thursday, January 14

Royal Society of Arts, Commonwealth Section (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Mr. R. L. E. Dreschfield: "The Preservation of Game in East Africa".

Institution of Electrical Engineers, Utilization Section (at Savoy Place, London, W.C.2), at 5 30 p m.—Mr. I. F. Davies and Mr. D. Dunthorne: "The Application of Power Transistors to the Operation of Gas Discharge Lamps from Direct Current Supplies".

Chemical Society (in the Lecture Theatre, The Royal Institution, Albemarle Street, London, W.1), at 7 30 p.m.—Prof C. Kemball: "Progress in the Study of Heterogeneous Catalysis" (Tilden Lecture).

Friday, January 15

Institute of Navigation (at the Royal Geographical Society, 1 Kensington Gore, London, S W.7), at 5 15 p.m.—Mr. J. F. Green and Mr. A. P. Glenny: "Heading Definition in Commercial Aircraft".

Society of Chemical Industry, Fine Chemicals Group (at 14 Belgrave Square, London, S.W 1) at 6.30 p.m.—Dr. A. H. Beckett: "Recent Developments in Analgesics".

Royal Aeronautical Society (at 4 Hamilton Place, London, W.1), at 7 p.m.—Mr. C. V. Dadd: "Biological Factors in Agricultural Aviation".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Assistant Biochemist, Basic Grade (with a science degree, preferably with honours in biochemistry or chemistry, or the A.R.I.C.)—The House Governor, The General Hospital, Birmingham 4 (January 16).

Physicist (Basic Grade), for duties in connexion with radiotherapy and isotopes—The Personnel Officer, St. Thomas's Hospital, London, S.E.1 (January 16).

Vice-Principal (with high academic and/or professional qualifications with substantial administrative experience of a relevant kind, for example, in education, industrial research or other professional work)—The Registrar, College of Advanced Technology, Gosta Green, Birmingham 4 (January 16).

Biologist, Assistant Experimental Officer grade (with a pass degree in a biological subject or equivalent), for work on plant virus diseases—The Secretary, Glasshouse Crops Research Institute, Worthing Road, Rustington, Littlehampton, Sussex (January 20).

Lecturer in Education—The Principal, Borough Road College, Isleworth, Middlesex (January 23).

Lecturer (Grade II) in Pure Mathematics—The Registrar, The University, Bristol 8 (January 25).

Technical Editor (Experimental Officer, preferably under 31, with at least H.N.C. or Inter-B.Sc. or equivalent, some knowledge of terms used in the fields of fuel and power, the ability to translate French and German, and preferably a knowledge of Russian) at the Ministry of Power, H.Q., London, for abstracting scientific articles; preparations of surveys of current literature; briefs and memoranda on fuel and power subjects—The Ministry of Labour, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting A.572/9A (January 29).

Lecturer in Mathematics at Victoria University of Wellington, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (New Zealand, January 31).

Lecturer (with some industrial or research experience, and preferably some teaching experience) in Physics—The Registrar, Royal Technical College, Salford 5, Lancs (January 31).

Senior Lecturer or Lecturer (preferably with a medical degree) in the Department of Pathology, University College of the West Indies—The Secretary, Senate Committee on Colleges Overseas in Special Relation, University of London, Senate House, London, W.C.1 (February 8).

Lecturer (with a special interest in plant physiology) in Botany at the University College of Rhodesia and Nyasaland—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1 (February 10).

Research Fellow (with M.Sc. or equivalent, with a special knowledge and/or experience of agronomy of tropical crops) in Tropical Crop Production at the Agricultural Research Station, University College of Ghana, Kade, in the forest region of Ghana—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1 (February 10).

Research Fellows (2) (with research experience in animal virology or in biochemistry) in the Department of Microbiology, John Curtin School of Medical Research, Australian National University, to work on either biological or biochemical aspects of animal virology—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (February 12).

Imperial Chemical Industries Research Fellows in Physics, Chemistry, Biochemistry, Engineering, Metallurgy and Pharmacology or any related subjects—The Registrar, The University, Liverpool (February 13).

University Librarian—The Registrar (Room 22, O R.B.), The University, Reading (February 13).

Professor and Chairman (with extensive experience in both teaching and research, preferably in the large animal field) of the Department of Animal Science—The Dean, Faculty of Agriculture, McGill University, Macdonald College, P Q., Canada (February 15).

Senior Lecturer in Geography at the University of Melbourne, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (February 15).

Senior Lecturer in Archæology and Ethnology at the University of Cape Town, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa, February 15).

University Tutor or Assistant Lecturer (medical and/or science graduate) in Microbiology—The Secretary, The Queen's University, Belfast (February 15).

Professor of Inorganic Chemistry—The Registrar, University Registry, Oxford (February 18).

Lecturer/Senior Lecturer (with good academic qualifications in electrical engineering, experience in the power field, and a working knowledge of electronic techniques) in Electrical Engineering at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, February 19).

Pasture Utilization Officer (honours graduate in science or agricultural science (or equivalent qualifications), with some years postgraduate research experience and training in animal physiology and nutrition) in the Division of Plant Industry, Commonwealth Scientific and Industrial Research Organization, Canberra, A.C T., Australia, to participate in the current programme of investigation which seeks to understand the plant, animal and plant–animal factors in normal grazing systems, by studying the animal factors affecting the nutrition demands of the ewe (and lamb) at pasture, of the ability, or otherwise, of the pasture to satisfy these demands—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W.C.2, quoting Appointment No. 130/891 (February 26).

Plant Breeder (honours graduate in science or agricultural science (or equivalent qualifications) with two or more years relevant postgraduate research experience) in the Division of Plant Industry, Commonwealth Scientific and Industrial Research Organization, Canberra, A.C.T., Australia, to collaborate with the established team of geneticists and plant breeders, and to assist in the extension of the current programme of studies on pasture plants by initiating independent studies on the breeding of pasture plants—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W.C.2, quoting Appointment No. 130/403 (February 26).

Chair of Botany, tenable in the Newcastle Division of the University of Durham—The Registrar, University Office, 46 North Bailey, Durham (February 29).

Chair of Geography in the University of Canterbury, Christchurch, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (New Zealand, February 29).

Chemist (with a good honours degree, experience in crop and soil analysis, and an interest in field experimentation), to investigate anion-cation relationships in soils and crop nutrition—The Secretary, Rothamsted Experimental Station, Harpenden, Herts (February 29).

Imperial Chemical Industries Research Fellows in Chemistry, Biological Chemistry, Engineering Pharmacology, Physics, or related subjects—The Registrar, The University, Bristol (March 1).

Imperial Chemical Industries Research Fellow in Chemistry or Physics—The Secretary, The University, Exeter (March 7).

Imperial Chemical Industries Research Fellows in Chemistry, Physiological Chemistry, Agricultural Chemistry, Agricultural Botany, Horticulture, Microbiology, Geology, Physics, or related subjects—The Registrar (Room 22, O.R.B.), The University, Reading (March 7).

Assistant, Grade B (with a good degree in chemistry and preferably some teaching experience) to teach Chemistry to G.C.E. Advanced and Part 1 B.Sc. level—The Clerk to the Governors, South-West Essex Technical College, Forest Road, Walthamstow, London, E.17.

Assistant Master (bachelor) to teach Mathematics—The Headmaster, Wrekin College, Wellington, Salop

Assistant or Associate Professor (Ph.D. or equivalent) in the Soil Science Department, for duties which will include research, teaching and extension in the field of soil chemistry and soil fertility—Head of the Soil Science Department, University of Alberta, Edmonton, Alberta, Canada.

Biochemist (with a first- or second-class honours degree) in the Biochemistry Department, for duties mainly concerned with radioactive isotopes, including thyroid hormone synthesis and utilization—The Secretary, Glasgow Royal Infirmary, 54 Castle Street, Glasgow, C.4.

Chief Technician in the Department of Chemistry, for duties which will include the supervision of laboratories and technical staff, as well as responsibilities for furnishing and equipping new laboratories planned for completion in 1962—The Registrar, The University, Liverpool 3, quoting Ref. No. 240N

Editorial Assistant (science graduate, preferably in biochemistry or chemistry, and preferably with some scientific editorial experience) at the Editorial Office of the *Biochemical Journal*—The Secretary to the Editorial Board, *Biochemical Journal*, The Lister Institute of Preventive Medicine, Chelsea Bridge Road, London, S.W.1.

Electronic Engineer (with at least H.N.C. or equivalent and several years relevant experience), to design and build equipment for a research group—The Administrator, Clarendon Laboratory, The University, Oxford.

Entomologist (with a good honours degree in zoology or entomology, and preferably postgraduate research experience in forest or timber entomology) with the West African Timber Borer Research Unit, Kumasi, Ghana, to undertake studies of the biology, ecology and control of timber and lumber pests—The Director of Recruitment, Colonial Office, London, S.W.1, quoting BCD.197/510/01/C.1.

Head (with a degree in metallurgy, chemistry or a related science at the Ph.D. level or equivalent training with a number of years experience in the field of metal corrosion) of the Corrosion Section, Physical Metallurgy Division, Department of Mines and Technical Surveys, Canada, to initiate and supervise research and investigations on fretting corrosion, stress corrosion and corrosion fatigue of various metals and their alloys—Department 1517, National Employment Service of Canada, 61 Green Street, London, W.1.

Horticultural Advisory Officer (with a university degree in horticulture and postgraduate experience) in Malta, to develop cultivation of out-of-season flowers, fruit and vegetables primarily for export—The Director of Recruitment, Colonial Office, London, S.W.1, quoting BCD 63/19/07/T.

Lecturer (graduate physical chemist or metallurgist) in Extraction Metallurgy—Prof. F. D. Richardson, Department of Metallurgy, Imperial College of Science and Technology, Prince Consort Road, London, S.W.7.

Lecturer in Physics at the University College of Rhodesia and Nyasaland—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1.

Lecturer (physicist, with experience and interest in high temperature gas physics) in the Department of Aerodynamics—The Recorder, The College of Aeronautics, Cranfield, Bletchley, Bucks.

National Research Council and other Post-Doctoral Fellowships, tenable in the Department of Physics—Prof. H. E. Duckworth, Chairman, Department of Physics, McMaster University, Hamilton, Ontario, Canada.

Scientific Officer (science graduate, preferably with honours in chemistry or biochemistry), for work on the preparation of blood products, including plasma protein fractions, with opportunity for research and developmental studies in an interesting and expanding field—The Director, Regional Blood Transfusion Centre, Royal Infirmary, Edinburgh 3.

Scientific/Senior Scientific Officers (with a first- or second-class honours degree in chemistry, or equivalent, and at least two years postgraduate research experience in organic chemistry, preferably with a bias towards the chemistry of natural products) at the Tropical Products Institute, D.S.I.R., London, W.C.1, to be members of small teams of research workers studying the isolation and structure of natural products possessing biological activity—The Ministry of Labour, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting Ref. F.849/9A.

Senior Lecturer in Pharmacology, and a Lecturer in Pharmaceutical Chemistry—The Registrar, Bradford College of Technology, Bradford 7.

Senior Cataloguer (chartered librarian, with experience in indexing scientific and technical information) in the College library—The Recorder, The College of Aeronautics, Cranfield, Bletchley, Bucks.

Senior Lecturer (qualified to direct and to teach to honours degree or Diploma of Technology levels, and preferably with industrial experience in a responsible position) in Textile Physics—The Registrar, Institute of Technology, Bradford 7.

Senior Physicist (with an honours degree in physics and experience in radiotherapy) with the Medical Research Council's Betatron Research Group, Christie Hospital and Holt Radium Institute, Manchester 20, to assist with the application of physics to the clinical use of the 4-MeV. Linear Accelerator and the 20-MeV. Betatron—Dr. Ralston Paterson, Christie Hospital and Holt Radium Institute, Manchester.

Technical Officer (man or woman, with an honours degree in mathematics, or in geography with a mathematical background) in the Survey Department, Government of Kenya, for survey computations and checking of survey plans—The Director of Recruitment, Colonial Office, London, S.W.1, quoting BCD.108/7/09.

Technician (Senior) (preferably with the Diploma of the Animal Technicians Association), to take charge of the Animal House—The Secretary, Guy's Hospital Medical School, London Bridge, S.E.1.

Technician (with a basic knowledge of, and an interest in, the maintenance and construction of electronic apparatus, and preferably experience in a physiological or pharmacological laboratory), to work in a new Department of Human Pharmacology—The Secretary, University College Hospital Medical School, University Street, London, W.C.1.

DEVELOPMENT OF ATOMIC ENERGY IN BRITAIN

THE Atomic Energy Authority Bill, the second reading of which in the House of Commons on November 18 was moved by Sir David Eccles, amends two provisions in the Atomic Energy Authority Act, 1954. The first raises from ten to fifteen the maximum number of 'members' of the Authority, and the second enables the Authority to include in its pension scheme those of its staff who are transferred to the employment of the National Institute for Research in Nuclear Science. The reasons for these amendments were explained by Sir David and also, on December 3, by Lord Hailsham, when as Lord Privy Seal and Minister for Science he moved the second reading in the House of Lords.

Sir David Eccles said that the first clause of the Bill sought to recognize the growing complexity of the Authority's work and to restore a measure of flexibility for the future in the composition of the governing body while preserving the balance between full-time and part-time members. Since 1954, the staff of the Authority had increased from 17,000 to 37,000, and the Industrial Group alone now employs more than 18,000, a figure expected to exceed 23,000 by 1961–62. Between 1956 and 1959 the Authority increased its staff scientists and engineers by 71 per cent, and the figure of 4,220 is expected to increase by 42 per cent by 1962. At present, some 63 per cent are engaged on research and development, and the industrial consortia themselves are believed to employ some 4,000 men on reactor design and development.

The immediate requirements arise partly out of the recent decision to split the Industrial Group into a Development and Engineering Group, in charge of Sir William Cook, already a full-time member of the Authority, and a Production Group, of which Sir Leonard Owen had been designated head. It was desirable that Sir Leonard Cook, too, should be a full-time member. Further, it was desired to retain the services, as a part-time member, of Sir John Cockcroft, now Master of Churchill College, Cambridge, whose place as member for research had been taken by Sir William Penney. While at present the need is only for two further places, it was considered better to provide for a maximum of fifteen, rather than the twelve immediately required.

As regards the second clause, Sir David Eccles explained that the National Institute for Research in Nuclear Science, established to help the universities and other learned bodies participate in fundamental research in nuclear physics, is growing fast, and its staff is largely interchanged with the staff of the Authority. At present the Authority has no power to admit the staff of the Institute to its superannuation schemes if they so desire. Lord Hailsham made it clear that this permissive power would apply to both temporary and permanent exchange.

Although the Bill was generally welcomed in both Houses, there was considerable discussion on particular points in the House of Commons. Mr. A. Greenwood, who opened the debate, welcomed it as the first of any substance on the Authority since 1954; but while stressing the importance of part-time membership of the Authority as facilitating the participation in its work of distinguished men of science and industry, he expressed some misgivings as to consistency in the higher planning of the Authority's work. He recognized the need for flexibility, but although the Select Committee on Estimates had endorsed both the decision to split the Industrial Group and to restore executive responsibility to the technical members of the Authority in spite of the recommendations of the Fleck Committee, Mr. Greenwood said he is not entirely reassured. Stressing the importance of comparable conditions of employment in the Authority and at the National Institute for Research into Nuclear Science, he pointed out that in 1958 the Industrial Group had vacancies for 258 university graduates. The Authority had offered posts to 422 graduates, but only 160 accepted the appointments offered.

Mr. A. Albu, who also supported the Bill, urged the increase of Government expenditure on fundamental research as likely to benefit the industry, and referred to anxiety, particularly in the Isotopes Division, due to the frustration by Treasury control of the efforts of the scientists. Mr. Albu asserted that in the past two years many heads of departments in the Authority had resigned because of frustration, and he thought that this might bear on difficulties experienced in recruiting senior staff. The main administrative difficulty at present, he said, is lack of a sense of direction, and this is directly attributable to the retardation in the commercial development of reactors in consequence of the change in the energy position in Great Britain. Mr. Albu himself suggested concentration on a small type of reactor suitable both as a marine reactor and as a small land-based power station, which he thought should have a considerable market and assist and benefit the under-developed countries. He also thought that we should go much further in co-operating with other countries in Europe, but he did not mention that Britain's only opportunity with Euratom is now in the 1,000-megawatt nuclear programme which at the outside may be added to the 2,000-megawatts of nuclear plant which is being commissioned by 1965.

This plea for clearer understanding of the economics of nuclear energy was supported by Mr. H. Davies, who asked for a further opportunity for a constructive debate on nuclear energy and referred, in particular, to the need to release more information from the restrictions of secrecy. Another plea for a further debate came from Mr. R. Mason, who, questioning whether the decision to develop gas-cooled graphite-moderated reactors had been wise, expressed concern as to the shortage of scientists, technicians and engineers and, in particular, regarding the loss of so many highly qualified scientists abroad. He thought we should make a serious attempt to ascertain why so many good scientists, technologists and engineers, who accepted research scholarships in the United States and Canada, failed to return. The relations with industry also required consideration, and in particular we should find some way of using to a greater extent the consortia and their experienced staff.

In replying on the debate, Sir David Eccles assured the House that there is no intention of stopping work on the manufacture and sale of isotopes. The recommendations of the Select Committee on Estimates on the relations between the Authority and industry had been accepted by the Authority. Relations in reactor technology are already close, and the observations of the Committee on the manufacture of fuel elements are receiving attention. Referring to recruitment, Sir David said that the senior professional staff had increased from 377 on March 31, 1958, to 511 at the end of September; for scientists and engineers, the figures were 6,900 and 8,600, while the senior administrative staff had increased from 56 to 93. The Bill was passed without amendment at the Committee stage at the third reading on November 25.

The debates clearly lent much support to the findings of the Select Committee on Estimates in its Fifth Report for the Session 1958–59; but they should also stimulate that wider thinking about the development of nuclear energy in the changed context of high-level stocks of solid fuel, even if in Great Britain there are not the low fuel prices that, with large stocks, have caused Europe's need of nuclear energy to recede into the 1970's. The only way to sell nuclear power is manifestly to sell it cheap, and the Minister for Science should note the strong demand for regular debates on nuclear energy for the further reason that much constructive thinking is still needed on the relations between the Authority and industry and with Euratom. What is being done at Winfrith Heath will obviously be affected by the duplication and waste already apparent in the research programmes of the six member countries of Euratom. The new outlook for nuclear power inevitably forces on Great Britain the need for greater watchfulness to avoid waste of resources and man-power in its development, alike from the competitive point of view and from that of the efficient use of our own limited resources, with which the Minister for Science is intimately concerned. Meanwhile, it should be noted that, since the debate, it has been announced in London, on December 4, that teams of scientists from Great Britain and Euratom countries are to co-operate in research on controlled thermonuclear reactors, fast breeder reactors and advanced gas-cooled reactors. It is hoped that the new agreements, besides eliminating wasteful overlapping in research projects, may lead to more efficient use of scientific man-power, as well as to exchange of information, co-ordination in forward planning by the British and Euratom teams, and interchange of personnel between Britain and the Continent.

A RATIONALE FOR BEHAVIOUR

Biological and Biochemical Bases of Behavior

Edited by Harry F. Harlow and Clinton N. Woolsey. Pp. xx+476. (Madison, Wisc.: University of Wisconsin Press, 1958.) 8 dollars.

According to the preface of this book, the symposium which it represents derived from the activities of a sub-committee to explore the relationship between the biochemical and biological sciences and mental health, and its purpose was to correlate behaviour with results obtained from other biological sciences: anatomy, embryology, physiology, pharmacology and biochemistry. In the present state of knowledge, this might appear to be somewhat ambitious and the biochemistry of behaviour is, to say the least, a study for the future. Nevertheless, the rational basis of behaviour will be found only by the persistent study of the related basic sciences.

It is perhaps unfortunate that, for reasons of economy, the comments of those taking part and the general discussion have been omitted from the book, since it might be expected that this part of the symposium would produce more integration between different fields. As it is, the book consists of a number of isolated contributions, with only one common link; namely, that each represents some aspect of the study of behaviour. When compared with other similar publications of which there has been a spate in recent years, this book is perhaps unique in that the major contribution is provided by experimental psychology. Both the opening and closing chapters are written by psychologists (Harlow and Hebb) and both emphasize the contributions of psychological method to the study of behaviour. They also stress that the psychologist must turn to other disciplines for an explanation of the mechanisms underlying the phenomena he is studying, an important step which not all have taken. It is not surprising, therefore, that more than one-third of the book is concerned with the relation between function, in terms of behaviour, and structure; this is illustrated by the effects of lesions in the brain on various aspects of behaviour, for example, sensory discrimination. Such studies, examples of which are too numerous to quote, lend themselves most readily to the application of psychological methods.

Neurophysiological contributions to behaviour are represented by those of Magoun and Jasper, who discuss the brain stem reticular activating system in relation to sleep and wakefulness and the role of diffuse projection systems in integrative processes, such as conditioning. Lilly describes the plotting of a 'motor' map of the cerebral cortex from observations of movements produced by localized electrical stimulation utilizing 610 implanted electrodes! Olds deals with the relationship between electrical events and behaviour in self-stimulation studies, the full implications of which have yet to be clarified. There is one purely anatomical paper (Woolsey).

There are three biochemical contributions to this book. Dr. Tower effectively summarizes the present state of neurochemistry, emphasizing the effects of biochemical lesions, for example, phenylketonuria, on cerebral function. He concludes with remarks that the neurochemical substrates of cerebral activity must, at some stage, be incorporated into the neurophysiological and behavioural structure of the central nervous system. Rosenzweig, Krech and Bennett have, in fact, made an attempt to correlate neurochemistry and behaviour, and theirs is a rare study involving collaboration between biochemists and behavioural scientists. They have investigated the relationship between acetylcholine metabolism, measured by cholinesterase activity, and the maze behaviour of rats. This work is extremely interesting, and. if it does nothing else, it re-emphasizes the importance of biochemical studies on small areas of brain tissue. Indeed, any study which could throw light on the changes in the central nervous system accompanying the learning process is more than worthwhile. However, as Tower points out, not only is the role of acetylcholine in the brain equivocal but also cholinesterase activity is a doubtful measure of its metabolism.

Beach discusses sexual behaviour and its modification by hormonal and neuronal mechanisms. It is of interest to recall that profound changes in primitive behaviour of this type have been known to be affected by different chemical structures for some time. Recent advantages in the elucidation of the structure of hormones and their chemical synthesis should provide an even sounder base-line for future study.

A book of this nature usually provides a fund of vogue words; "interdisciplinary" and "major breakthrough" have been met before but "ideational" is new to us. As is inevitable in publications of this nature, much of the material has been published elsewhere, either before or since the symposium was held, while other contributions represent entirely new work. This does not detract from the value of the book nor does the fact that it is now three years since the symposium took place. It is a useful guide to current thought and knowledge and should be read by all interested in the study of behaviour. The book is provided with an adequate subject index.

P. B. BRADLEY

CRYSTALLOGRAPHER'S TOOL-CHEST OF MATHEMATICS

International Tables for X-ray Crystallography
Edited by John S. Kasper and Kathleen Lonsdale. Vol. 2: Mathematical Tables. Pp. xviii+444. (Birmingham: The Kynoch Press, 1959.) 115*s*.

THESE tables form the second instalment of the complete revision and expansion of the original "Internationale Tabellen" of 1935. The history of these tables and of the present project have been described by Ewald in his review (Ewald, P. P., *Nature*, 171, 944; 1953) of Vol. 1 of the present tables. Vol. 2 has been compiled with the object of including all the formulæ and mathematical tables that a crystallographer may be reasonably expected to require. They contain no data that depend on physical measurement; such data will appear in Vol. 3.

Perhaps the most significant innovation in these tables is the inclusion of a 90-page section on mathematical methods. This covers algebra, trigonometry (plane and spherical), calculus (integral and differential), vector and tensor analysis, Fourier-transform theory and statistics, and comprises definitions, theorems, methods of attack, and examples of practical applications to crystal structure analysis. Here one can find readily, for example, how the characteristic values and vectors of a matrix may be calculated; what methods are available for the numerical solution of transcendental and other 'insoluble' equations, and what are their relative merits and particular applications; what are the general properties of groups; how the Fourier transform of a discontinuous function may be expressed in terms of the discontinuities; how to apply a statistical significance test; over what range of values of x is $\sin x$ equal to $x - 1/6\, x^3$ to within 0·001; how a given number may be approximated to a rational fraction by the use of continued fractions. There are many references to standards texts and to special articles. It is surprising, however, that interpolation formulæ are not treated, since these should be within easy reach of anyone who uses tables, and are moreover useful whenever the question of the most suitable interval for the tabulation of mathematical functions or of experimental observations is under consideration.

Under the heading "Crystal Geometry" there are definitions and formulæ relating to direct and reciprocal lattices, angles between planes, twinning conditions, and quadratic forms. A section on diffraction geometry deals with all the well-known techniques for recording X-ray diffraction patterns; their particular characteristics and applications are listed and formulæ and tables relevant to each method are given. The accuracy of measurement of lattice parameters is treated in considerable detail. "The Physics of Diffraction Method" covers formulæ for the intensity of diffraction by a crystal, and the corrections for temperature effects, absorption and extinction. Under "Fourier Synthesis and Structure Factors" appear formulæ for the various types of synthesis that are in use, and methods of structure refinement are fully treated. There is also a survey of digital and analogue methods of numerical Fourier synthesis.

Further topics are the close packing of spheres in various space groups, statistical tests on intensity data for the detection of symmetry elements, and inequalities between structure factors that may give information about their phases. (The *probable* relations between phases are not included, however.) Finally, there are some useful sets of trigonometrical tables (tailored for crystallographers), and a glossary of crystallographic terms in English, French, German, Spanish and Russian, in rather more detail than that in Vol. 1.

The criteria on which such tables are to be judged are those of comprehensiveness, ease of use, and comprehensibility. On the first and second scores it is almost impossible to find any fault. The compilers took the view that nothing of potential application should be left out, since few crystallographers have a perfect memory for formulæ, and most prefer not to spend time working them out or searching textbooks. A very full and systematic contents list makes all material easily accessible, and renders an alphabetical index unnecessary. On the third score it is again difficult to find fault, but one wonders whether perhaps mathematical elegance and logical development have occasionally been given first place rather than ease of reference; for example, the introduction to the section on "Fourier Theory" (surely a slight misnomer because Fourier also had a theory of heat conduction) might well scare the weaker mathematician into thinking that he has come to the wrong book. But this criticism does not apply generally.

The layout and printing are of excellent quality, and the binding is pleasing in appearance and made for hard use. The price is in line with that of any first-class text-book of to-day; if it saves a laboratory a total of five days of research-worker time or one hour of computer time it will have yielded a handsome profit.

THOUGHTS ON COMMUNICATION

The British Association Granada Lectures

Science and Communication. By Sir Edward Appleton. Television and Politics. By Edward R. Murrow. Dons or Crooners? By Sir Eric Ashby. (Three Lectures given in Guildhall, London, in October 1959, on the subject of "Communication in the Modern World".) Pp. 111. (London: Granada TV Network, Ltd., 1959.) 3*s*. 6*d*.

THESE three lectures were organized by the British Association and sponsored by Granada TV Network, Ltd. They were delivered in Guildhall, telecast later in a considerably shortened form, and now appear in print. This immediately presents one with the problem of how to treat them: as lectures, television or essays? Not having seen them on television, I will ignore this aspect.

The general title of the three lectures is "Communication in the Modern World". None of the lectures conflicts with this title, but they are related only formally.

The first lecture, by Sir Edward Appleton on "Science and Communication", gives a lucid account of modern communications, but says little that is new. One expects a few original ideas in a 'prestige' lecture of this sort. He might well have extended the section where he speculated about future developments. From a man so eminent in the field of communications, this would have been far more interesting than a summary of our present knowledge, as already several good ones exist.

Dr. Edward R. Murrow gave the second lecture on "Television and Politics". He throws out ideas, wittily recounts numerous telepolitical anecdotes and very wisely draws the final conclusion: "In the area of political television we are all ignorant". Another point he makes, rather more tentatively, is that it is personalities that come across, not ideas. For example, Vice-President Nixon during his election campaign was accused of accepting too many presents. He appeared on television and won overwhelming support from the public by refusing to give up the one present he admitted to receiving—a little dog—because "the kids love that dog". Similarly, Dr. Murrow ascribes McCarthy's rise largely to his flair for publicity on television, and he suggests that Stevenson would have done better in a non-television election where he was not up against Eisenhower's homely personality. But—"It is a limited medium . . . it can arouse curiosity . . . entertain . . . sell goods. But it can't reason . . ."

Sir Eric Ashby, in his lecture "Dons or Crooners?", is the only one really to put forward a thesis. It is this: The ordinary man does not feel that he really belongs to society, as he did, say, in the Middle Ages. This is because he is unable to understand the science on which it is based. Therefore, he must be given some understanding of science, and this should be done by emphasizing the importance of technique in science, for the ordinary man is a craftsman and he appreciates craftsmanship. This is an excellent plan so long as it is not regarded as the only one. But Sir Eric is very patronizing about the ordinary man. He is called Ron Blossom and he lives in Doris Grove, Birmingham. His response to a dramatic scientific discovery is to say "Cripes". One thing no one can afford to do if he wants to put an idea across without antagonizing the recipient is to patronize him. Surprisingly for the author of "Technology and the Academics", Sir Eric says: "The interpretation of science to the likes of you is no problem. You have the Third Programme and Pelicans . . ."; 'you' in this case being a 'Third Programme audience'. Now it is only true that the interpretation of science to highly intelligent people presents no problems if the people are interested. The trouble is that a great many of them are not. Where there is a will there may be a way. But it does not follow that where there is a way there is a will.

B. SILCOCK

DESCRIPTIVE ASTRONOMY

Elementary Astronomy

By Prof. Otto Struve, Beverly Lynds and Helen Pillans. Pp. vii+396. (London and New York: Oxford University Press, 1959.) 55*s*. net.

THIS is a text-book based on a new approach to the study of astronomy. Many elementary texts have considered primarily the historical and purely factual descriptive aspects of astronomy. Recently, there has been felt a growing need for a course emphasizing the physical basis of astronomy, using at most the simplest mathematics to perform calculations illustrative of the physical principles involved, but still including enough descriptive material to give the student a basic knowledge of modern astronomy. This book aims at meeting this need, and it fulfils its intentions admirably. The subjects are treated in more or less conventional order, starting with the Earth, Moon and planets, followed by the Sun, the stars and star clusters, and ending (apart from a chapter on instruments) with galaxies, but the book has quite a different tone compared to older texts. Rarely has a volume intended for serious students been so profusely illustrated, excelling most of the avowedly popular books. Still more rarely has any general text-book contained so many illustrations from the recent periodical literature. The senior author has in the past attained a reputation for his descriptive articles no less than for his research work, and this book fully maintains this reputation.

Astronomy, in common with all other sciences, is developing very rapidly, and no one can be an expert in all its branches. Yet the whole of this book is surprisingly up to date, a feature which will commend it to teachers of astronomy. Most of the book will be intelligible to amateur astronomers, and it should find a place on the shelves of every general library with an astronomy section. The authors state in the preface that their book is not intended to replace the many excellent text-books of descriptive astronomy now in use. The reviewer is confident that it will indeed become the leading introductory text on its subject.

R. H. GARSTANG

Recent Advances in Atmospheric Electricity

Proceedings of the Second Conference on Atmospheric Electricity, held at Portsmouth, New Hampshire, May 20–23, 1958. Edited by L. G. Smith. (Sponsored by Aerophysics Laboratory, Geophysics Research Directorate, Air Force Cambridge Research Center, Air Research and Development Command.) Pp. xv+631. (London and New York: Pergamon Press, 1958.) 120*s.* net.

THIS book reproduces the fifty or so papers that were presented at the conference named in the sub-title. They are arranged under three sub-divisions: fair-weather electricity, thunderstorm electricity and the lightning discharge. In some cases a résumé of the discussions following a paper is included. There does not appear to have been any attempt at making a selection of the more important contributions for publication and in consequence the value of individual papers varies widely. It is difficult to find out from such a varied assortment of material how much of it does really represent recent advances in the subject; some of the papers describe work that is already well known, while others are more in the nature of interim reports.

It is significant that a large part of the work described is devoted to atmospheric electrical investigations in the upper air by means of aircraft measurements and radio sondes. Another significant trend is the use of radar in studying thunderstorm precipitation and lightning.

Interested people who were unable to attend the conference will welcome the opportunity of learning what went on there, and there is no doubt that the active worker in the subject can find a great deal of interest to him in many of the papers reproduced in the book. But it is very doubtful whether a book as expensive as this, beautifully produced though it is. will attract many individual purchasers.

F. J. Scrase

Principles of Organic Chemistry

By T. A. Geissman. Pp. viii+635. (San Francisco: W. H. Freeman and Company; London: Bailey Bros. and Swinfen, Ltd., 1959.) 7 dollars; 56*s.* 6*d.*

THE author has written an elementary text-book of organic chemistry which includes most of the material required by a first-year university student, but which has its emphasis on important functional groups and on general types of organic reactions. This approach leads to obvious omissions in a book of such moderate size, but Prof. Geissman holds very reasonably that the student's time is initially better spent in the study of principles than in the acquisition of general information. The last sixty pages, however, are largely descriptive and deal with structurally more complicated molecules, many of which are biologically important. Thus the discussion of the basic principles of the subject has been complemented by some of its major achievements and applications. In this way, the student is shown some of the scope of organic chemistry.

Prof. Geissman has, on the whole, succeeded in his objects. The presentation and printing of the book are both good, except that some of the diagrams of molecular models are confusing and that a few errors in formulæ may be misleading to students. Perhaps the allocation of space to various topics is a little unbalanced. For example, more room is given to aromatic electrophilic substitution than to stereochemistry. Nevertheless, this book can be enthusiastically recommended as an interesting and stimulating introduction to organic chemistry.

C. B. Reese

Introducing Astronomy

By J. B. Sidgwick. Pp. 259. (London: Faber and Faber, Ltd., 1959.) 6*s.* net, paper bound.

THIS book is a fairly drastic revision of the same author's "Astronomy for Night Watchers" and, as such, is aimed at promoting an interest in astronomy in the layman; no knowledge of mathematics or physics being presumed. It is divided into two roughly equal parts. After two introductory chapters, the first part consists of an elementary outline of descriptive astronomy, taking the usual route outwards from the Sun to extra-galactic nebulæ; followed by simple explanations of some astronomical instruments. The second part is almost entirely taken up with a description and sketch of each constellation in turn, mentioning such objects of especial interest as may be observed with binoculars. These artificial divisions may be a disadvantage from an observer's point of view but allow the inclusion of a brief history and mythology of the constellations.

Mr. Sidgwick writes with an easy style and has succeeded in producing a very readable and balanced introduction to astronomy with very few errors, none of which seriously detracts from its value. Definitions are introduced as necessary and there are numerous cross-references, so the beginner should encounter few, if any, stumbling-blocks. The reader whose new interest in this old science has been so ably fostered is likely to want to know more. It seems a pity, therefore, that space has not been spared for even a short bibliography.

B. R. Leaton

The Birds of the British Isles

By Dr. David Armitage Bannerman. Vol. 8: Phalacrocoracidae, Sulidae, Fregatidae, Procellariidae, Diomedeidae, Podicipedidae, Gaviidae, Columbidae, Pteroclididae. Pp. x+400+26 plates. (Edinburgh and London: Oliver and Boyd, Ltd., 1959.) 63*s.* net.

THE eighth of Dr. Bannerman's impressive volumes is largely concerned with sea-birds—the cormorants, the gannet and the petrels. The magnificent frigate-bird is included on the strength of its sole recorded appearance, in 1953, and the black-browed albatross in view of two certain and a few doubtful records; with these, as also with the rarer petrels, the author follows his practice of giving full information from the regions where the birds more truly belong. Then come the grebes, the divers, the pigeons and, finally, Pallas's sandgrouse. The remarkable spread of the collared turtle-dove, unknown in Britain until the present decade, is duly chronicled; so also are the extraordinary occasional visitations of the sandgrouse from the Aral-Caspian region. To an increasing extent Dr. Bannerman has included contributions from other writers. Thus the whole chapter on the gannet is by Mr. George Waterston and those on two of the exotic petrels are by Dr. Alexander Wetmore, while various other chapters have sections by ornithologists with special knowledge of particular aspects.

Landsborough Thomson

MAGNETOTROPISM: A NEW PLANT-GROWTH RESPONSE

By Prof. L. J. AUDUS
Botany Department, Bedford College, London

TWO major theories of graviperception now stand opposed. One due to Brauner[1] is based on the so-called geoelectric effect. Apart from the uncertainty cast on this whole phenomenon by recent investigations[2], I have long felt that the forces involved were utterly inadequate to cause the extremely rapid and extensive changes in hormone concentration required by the observed rates of growth response. In the second and classical statolith theory, cell particles having a density different from that of the surrounding cytoplasm move under gravity to one side of the responding cell, thereby evoking a growth response. Starch grains in certain cells of virtually all receptor organs studied respond in this way by sinking to the lower side of the cell[3]. How such lateral migration of starch grains could cause rapid changes in hormone distribution has already been discussed elsewhere[4].

The fact that organs respond to laterally applied electrostatic potential gradients has been regarded as very strong support for the geoelectric theory, although recent findings[2] call for a major revision of ideas on this phenomenon. No similar kind of support has been forthcoming for the starch-grain statoliths because so far no forces other than those arising from the mass of the grain itself (that is, gravity, centrifugal force) have been employed to shift them in the cell. In consideration of the possibilities of circumventing this difficulty, attention was given to the behaviour of organic substances in strong magnetic fields. They are normally weakly diamagnetic, and if therefore particles of such materials are placed in a *non-uniform* magnetic field, then a force will be exerted on such particles in the direction of the maximum gradient and equal to:

$$(K_1 - K_2)v.H.\frac{dH}{dx}$$

where K_1 and K_2 are the volume susceptibilities of the particle and suspending medium respectively, v is the volume of the particle, H the magnetic field strength and dH/dx the field gradient.

Few, if any, experimental observations have been made on the magnetic susceptibilities of starch or protein solution, like that surrounding statolith starch in the cytoplasm of the plant cell. Since exact experimental determination of these unknown parameters promised to involve much time and the employment of special techniques, it was resolved, in the first place, to study the behaviour of a suitable organ in a steep magnetic gradient. To this end a large permanent magnet, designed for use with a magnetron, was employed. This was fitted with soft iron pole pieces of triangular cross section as in Fig. 1. Direct measurements of the field strength by the Quincke method showed that such an arrangement gives maximum field strength just inside the narrowest point of the gap and the steepest gradient in an outward direction in the plane A–B, as is shown by the graph of Fig. 1. The field strength in this plane was 4,000 gauss and the gradient—5,600 gauss per cm.

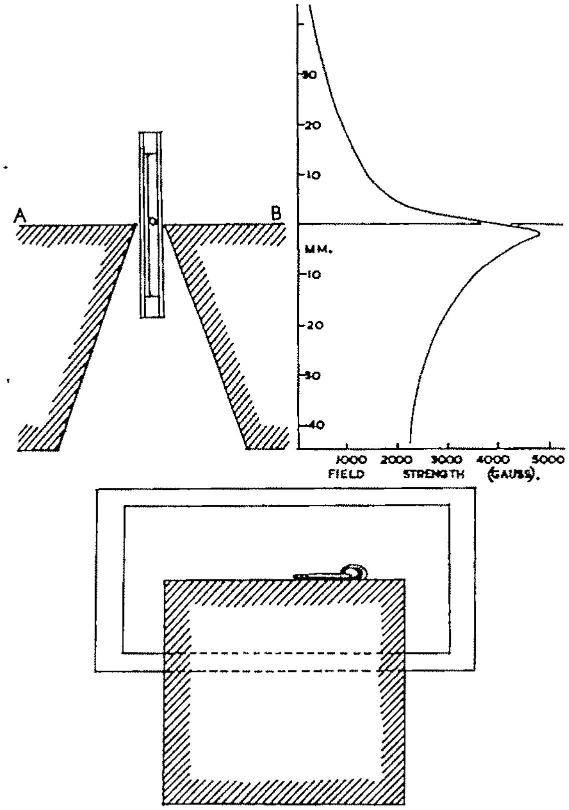

Fig. 1. Diagrams showing magnet gap design, position of glass growth chamber and cress seedling roots and field-strength distribution through the gap. Top, cross-section and field-strength curve; bottom, end view

The organ chosen for study was the seedling root of *Lepidium sativum* growing under sterile conditions on plain 2 per cent agar in a small glass chamber of design shown in Fig. 1. The seedlings were germ-

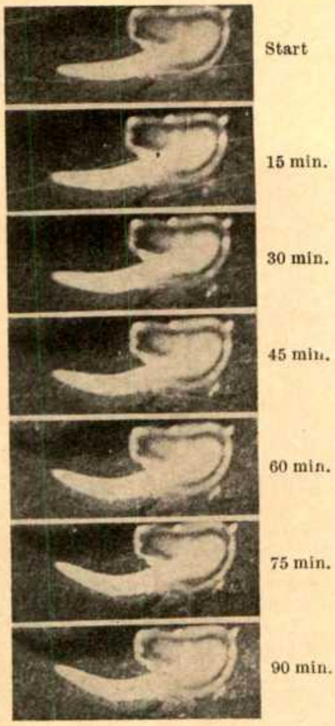

Fig. 2. Progress of curvature of 36-hr. roots of *Lepidium sativum* seedlings down the magnetic gradient

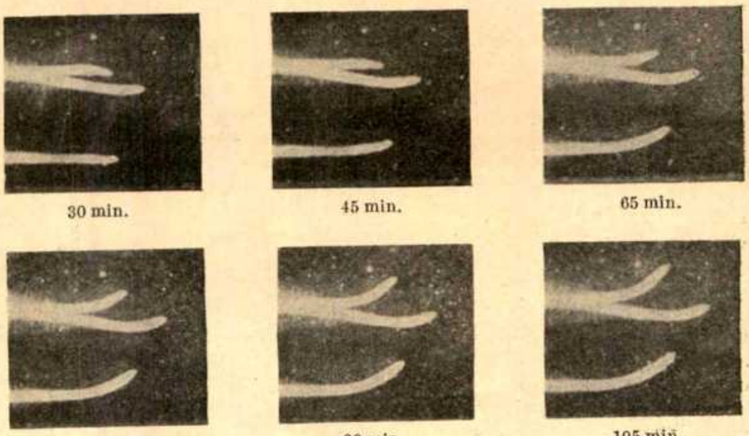
inated and grown for 36–60 hr. in the dark in an incubator at 25° C. and the roots allowed to grow downwards along the vertical surface of the agar. At the commencement of the treatment the chamber was inserted as illustrated between the poles of the magnet so that a root lay parallel to the gap and slightly above it, as near as possible to the region of maximum force. The magnet, which was held in a heavy brass cradle and mounted on an axle in ball bearings was rotated about the axis of the gap at a speed of about 2 revolutions per min. to eliminate gravitational effects which might swamp any magnetic effects. At intervals of 10–15 min. the root tip and edge of the nearest pole piece were photographed from the direction $A \rightarrow B$ by an automatic 35 mm. Robot camera provided with an 8-in. lens giving an image almost natural size on the film. The photographs were taken with synchronized electronic flash illumination of 1 µsec. duration without stopping the rotation. The direction of flash illumination was thus at right angles to the magnetic gradient; but, in any event, as shown by experiments employing visual observation only, this flash illumination had no detectable effects either on control roots out of the field or on those situated just above the gap. All these observations were made at room temperatures (18–22° C.) and in weak diffuse light.

A large number of experiments have now been performed, and in all but a very few cases roots have shown marked growth curvatures away from the gap, that is, down the magnetic gradient. Typical results for a 36-hr.-old root and 60-hr. roots are shown in Figs. 2 and 3 respectively. From the photographic records, preliminary estimates have been made of the reaction time by extrapolating backwards the curvature progress curve to cut the axis of zero curvature. In the fluctuating summer temperatures of the laboratory (18–22° C.) the values obtained fell between 30 and 45 min. Under similar environmental conditions measurements have shown the time of reaction to a continuously applied gravitation stimulus to be 4–8 min.

Having obtained such success with growth responses, attention was then focused on starch grains. First, the value of their diamagnetic susceptibilities was considered. By use of the Pascal constants it is possible to calculate from their molecular structures the magnetic susceptibilities of organic molecules. Assuming for these purposes starch grains to be amorphous the average volume susceptibility (K_{ST}) can be estimated to fall between about $-0\cdot74$ and $-0\cdot62 \times 10^{-6}$ c.g.s. units depending on the value of the density of the starch grain taken to derive it from the specific susceptibility χ. The average value of volume susceptibility for the surrounding cytoplasm (K_P) is much more difficult to assess but should differ very little from that of water, that is, $-0\cdot72 \times 10^{-6}$ c.g.s. units. The difference in the two susceptibilities will therefore fall between $+0\cdot10 \times 10^{-6}$ and $-0\cdot02 \times 10^{-6}$ and the resultant force on the grain may be either inwards towards the gap or outwards away from it, depending on the particular value of K_{ST}. However, starch grains are not amorphous and it is therefore possible, as has been shown for cellulose[5], that they may show appreciable diamagnetic anisotropy. If we make the reasonable assumption that the maximum value of K_{ST} along a particular axis of the grain could rise to 25 per cent above the average susceptibility calculated above, then this maximum value of K_{ST} falls between $-0\cdot93$ and $-0\cdot78 \times 10^{-6}$ c.g.s. Since the starch grain would orientate itself in the field so that its axis of maximum susceptibility would be perpendicular to the lines of magnetic flux, that is, along the maximum field gradient, then the effective force on the grain would consistently be away from the gap. It is a simple matter to get an estimate of this magnetic force in terms of the gravitational



30 min. 45 min. 65 min.
75 min. 90 min. 105 min.

Fig. 3. Progress of curvature of 60-hr. roots of *Lepidium sativum* seedlings down the magnetic gradient

force acting on the same grain. Thus the gravitational force is expressed by the formula:

$$(\rho_{ST} - \rho_P)v.g$$

where ρ_{ST} and ρ_P are the densities of starch and protoplasm respectively. The ratio of the magnetic force to this force is given by the formula:

$$\frac{(K_{ST} - K_P)}{(\rho_{ST} - \rho_P)} \cdot \frac{H}{g} \cdot \frac{\mathrm{d}H}{\mathrm{d}x}$$

The value of ρ_{ST} can be estimated only approximately. Dry potato starch has a density of 1·5, which falls to 1·25 when the grain is fully imbibed. Egg white, taken as near model of cell protoplasm, gives an estimate of $\rho_P = 1{\cdot}04$. Depending then on the density taken for the statolith starch grain we obtain numerical values for this ratio ranging between 0·01 and 0·0065. This ratio is very small compared with the ratio of reaction times for magnetotropic and geotropic curvatures respectively. It is possible, however, that the ratios of presentation times, which would presumably be directly related to starch grain movement, might more nearly approach this calculated ratio of available forces.

With these possibilities in mind, attempts have been made to observe the behaviour of starch grains in roots bending in this magnetic field. Thus, with the minimum of delay after rotation was stopped, curved roots were removed from the experimental chamber and fixed in formalin–acetic–alcohol. They were first placed on the surface of a small disk of radish tissue in a film of sodium alginate dissolved in diluted indian ink, and carefully and quickly orientated thereon so that later the plane of cutting in the paraffin block could be easily and accurately identified. The whole was flooded with fixative containing 1 per cent calcium chloride simultaneously to fix the root and to turn the sodium alginate solution into a rigid calcium alginate gel. After embedding in paraffin wax, longitudinal sections were cut at 8μ in the plane of bending and stained for 24–48 hr. in dilute aqueous iodine. Measurements of starch grain distribution were made on all the root-cap cells appearing to be complete in one or more median or near median sections of well-curved roots. By using an ocular with a median hair line, which was adjusted to bisect the cell as nearly as could be judged by eye in a direction parallel to the main root axis at the tip, the numbers of starch grains on the two sides of each cell were counted and differences determined. Results of these preliminary observations are shown in Table 1. It will be seen that in most sections there is a very slight preponderance of grains in that half of the cell nearer the concave side of the root, that is, the side away from the magnet. In two sections only is this shift significant at the 5 per cent level and in most cases it is not significant. However, the overall picture is undoubtedly one of a slight shift of starch grains down the magnetic field gradient.

Suggestive as they are, these preliminary experiments do not yet constitute proof of the statolith starch theory of graviperception. They must be followed by more precise studies on starch grain behaviour in root caps and with completely unambiguous and objective methods in order to eliminate any possibility that the very small shifts recorded are not artefacts of technique or observation. In addition, exact experimental determination will have to be made of the magnetic properties of these starch grains both inside and outside the cell and of the surrounding protoplasm if suitable methods can be found for studying them. The present experiments do most strongly suggest, however, the involvement of some moving material which distributes itself in the cell under a magnetic gradient in the same sense as it does under gravity. Thus if it were a cytoplasmic particle it would have to be either denser than cytoplasm with a higher diamagnetic susceptibility, or less dense with a smaller susceptibility. However, we must not lose sight of the fact that the root as a whole will be subjected to a small outwardly directed force which will set up small bending stresses in the growing zone. The part such stresses may play in the growth responses observed must also be fully elucidated.

Table 1

Root	Section (numbered in series)	Average number of starch grains per cell	Average difference in number of starch grains. Concave–convex side	$\sigma/\sqrt{N}$	N	P
1	Median	7·40	0·79	0·37	33	0·05
2	Median	5·75	0·58	0·48	12	n.s.
3	1	5·17	0·27	0·66	11	n.s.
	2	6·1	0·5	0·63	10	n.s.
	3	6·95	1·50	0·62	20	0·03
	4	6·53	0·75	0·39	28	n.s.
	Median	6·55	0·27	0·36	29	n.s.
	Median	5·23	0·32	0·36	38	n.s.
	7	6·08	0·35	0·35	37	n.s.
	8	7·04	1·0	0·56	22	n.s.
	9	6·46	0·36	0·35	28	n.s.
	10	9·00	1·29	0·54	21	0·03
	11	8·27	−0·61	0·48	18	n.s.
	12	9·21	0·21	0·98	14	n.s.
4	1	7·43	−0·48	0·47	23	n.s.
	2	7·64	0·91	0·81	11	n.s.
	Median	8·17	0·0	0·53	24	n.s.
	3	11·01	0·17	0·73	12	n.s.
5	1	7·92	1·32	0·62	28	0·05
	2	6·00	0·3	0·36	20	n.s.
	Median	7·55	0·64	0·51	22	n.s.
	4	7·20	0·09	0·80	11	n.s.

So far the phenomenon has been investigated with only one organ of one plant species. It must be extended to roots of other species and also to other organs, such as the coleoptile, to see how universal is the correlation between the responses to gravity and those to a magnetic gradient.

Such experiments are being actively pursued, and it is hoped that this new phenomenon may prove to be a valuable tool in our attack on the problem of the mechanism of graviperception.

I wish to acknowledge my indebtedness to Dr. V. I. Little of the Physics Department, Bedford College, for many valuable discussions, for advice in the design of apparatus and for arranging the loan of the magnet used; to Dr. V. C. G. Trew of the Chemistry Department, for information on magnetochemistry and the calculation of diamagnetic susceptibility of starch, and to Dr. B. C. Sharman of the Botany Department, Bedford College, for suggesting the use of calcium alginate as a cement in the orientation of roots for embedding.

RADIATION CARCINOGENESIS: A NEW HYPOTHESIS

By Dr. P. R. J. BURCH

Medical Research Council Environmental Radiation Research Group, Department of Medical Physics, University of Leeds, The General Infirmary, Leeds 1

THERE is growing scientific and social concern about the possible influence of small doses of ionizing radiation upon the incidence of leukæmia and bone cancer in human beings. That large doses of X-rays (of the order of 1,000 rems) can occasionally induce leukæmia, and that long-standing radium burdens (of the order of several μgm.) in the human skeleton can occasionally produce bone cancer, are facts which are not in dispute. However, at doses and dose-rates comparable to background (generally about 0·1 rem/yr.), changes in cancer incidence are likely to escape detection because on any plausible theory they will represent only a small fraction of the normal incidence. To predict the somatic effects of small amounts of radiation we are therefore compelled to use statistics relating to high doses, and to extrapolate to low by means of a theoretical dose–response relationship.

The linear theory of carcinogenesis, which states that the incidence of radiogenic cancer is directly proportional to the radiation dose, has recently been criticized so effectively by Brues[1] that it must be regarded as being of very doubtful validity. Kimball[2] challenges the reliability of the statistics and statistical tests used by Lewis[3] in support of a linear theory of radiation leukæmogenesis. Mewissen[4], analysing the dose–response relationship in radiation leukæmia by the method of marking probits, suggests that leukæmogenesis may require more than one critical molecular event, although a single event may be the initiating agent.

Experiments in which osteogenic sarcomas in mice were induced by bone-seeking radioactive isotopes are regarded by Finkel[5] as giving evidence for a threshold effect. The low doses received by human beings from world-wide radioactive fall-out will not, she concludes, induce a single osteogenic sarcoma. By contrast, a maximum upper limit is predicted[6] from the linear theory of nearly ten cases per annum per million of population (for strontium-90 at an equilibrium-level in bone, assuming continuation of bomb tests). In view of the great diversity in these estimates, it is necessary to re-assess the evidence and to consider whether there is any alternative to the linear and threshold theories.

In this article, human radiogenic leukæmia and bone cancer will be considered, and arguments will be advanced in support of the tentative view that both diseases are initiated by a highly specific 'two-hit' mechanism.

Dose–Response Relationship in Human Leukæmogenesis

Court Brown and Doll[7] examined the statistics for the incidence of leukæmia in patients irradiated for ankylosing spondylitis and adopted the working hypothesis that there is no threshold dose, and that at low doses the incidence of radiogenic leukæmia is proportional to dose. Their results are re-plotted on log–log scales in Figs. 1 and 2. In Fig. 1, where the standardized incidence in excess of normal (that is, the radiogenic incidence) is plotted against the mean dose to the spinal marrow, it appears that a line of slope 2 gives at least as good a fit to the points as a line of slope 1. This implies that the radiogenic leukæmia incidence-rate might equally well be proportional to the square of the mean dose to the spinal marrow as to the first power. Court Brown and Doll refer, however, to the unreliability of the point at highest dose where extra-spinal marrow received a larger proportion of the dose than at the lower dose-ranges.

In Fig. 2, the radiogenic incidence-rate is plotted against the whole-body integral dose. Since the statistical errors will be similar to those in Fig. 1, the fit of the points to a line of slope 2 is very good, and it suggests that the radiogenic incidence-rate might be proportional to the square of the whole body integral dose. These quadratic relationships have been briefly noted previously[1,8], and they hint at the possibility that radiogenic leukæmia may require a two-hit process for its initiation. It will be seen later, however, that if the hypothesis elaborated here is true, this evidence will require very extensive re-interpretation before valid conclusions can be drawn from it concerning the dose–incidence relationship.

Consideration of other evidence of human radiogenic leukæmia will be deferred until after the mathematical relationships have been presented.

Dose–Response Relationship in Human Bone Cancer

The scanty data[9] for mortality from bone cancer as a function of terminal radium burden are plotted on log–log scales in Fig. 3. They imply that radiogenic incidence is proportional to the square of the terminal radium burden. Differences in radium uptake will give rise to different deposition patterns in bone. Despite this complication, for long-term burdens there may be a rough correspondence between the square of the average terminal burden for a group and the effective mean square dose to relevant bone tissue. If this can be assumed, then for radiogenic bone cancer, as for leukæmia, there is a suggestion that a two-hit process is involved.

The formal properties of two contrasting two-hit models will now be considered.

Fisher's Multiple Mutation Theory

The idea that natural or spontaneous cancers may arise through a succession of somatic mutations has been put forward on many occasions[10], and most recently by Fisher[11], who postulates the following sequence of events: (1) a somatic mutation; (2) clone growth from the mutated cell; (3) a second mutation within a clone cell which, in the case of a two-mutation sequence, will give rise to cancerous growth.

In the case of a three-mutation sequence, (3) above is followed by: (4), a second clone-growth of cells containing two mutations, and (5), a third mutation within this clone leading to tumour development.

Fisher also argues that in epithelial tissues it is likely that the number of mutated cells in a clone increases (after the first few divisions) in proportion to the square of the time. If it is considered that a *natural* cancer arises as a result of n successive spontaneous mutations, and if mutation-rates and clone growth-rates are invariant with respect to age, the age-specific incidence-rate is shown by Fisher to be proportional to $(\text{age})^{3(n-1)}$. Thus, for $n = 2$, the age-specific incidence-rate would be proportional to $(\text{age})^3$ and for $n = 3$ it would be proportional to $(\text{age})^6$. Court Brown and Doll[12] have examined the natural death-rate versus age relationships for chronic lymphatic, chronic myeloid and acute leukæmias. With chronic lymphatic leukæmia there is probably no genuine cohort effect[12] (that is to say, the actual death-rate from chronic lymphatic leukæmia at a given age is not changing with time) and the age-specific death-rate is proportional to $(\text{age})^6$; thus, assuming the difference between age at incidence and age at death will not appreciably distort the relationship, a triple-mutation sequence would be implied. For chronic myeloid leukæmia it is again likely that there is no genuine cohort effect[12], and for this disease the age-specific death-rate is proportional to $(\text{age})^3$, suggesting a double-mutation sequence. Acute leukæmia shows a marked cohort effect between the years 1945 and 1957 and the shape of the age-specific death-rate versus age curve is unusual, with mortality falling from adolescence to a minimum at 25–29 years, and then increasing slowly up to 70 years. Since the cohort effect suggests the presence of an extrinsic leukæmogenic agent, no reliable conclusion can be drawn about a possible intrinsic death-rate versus age relationship, except that from Court Brown and Doll's graph it appears unlikely to be of the sixth-power type.

It may well be significant that radiation exposure has been associated with chronic myeloid and acute leukæmias, but not with chronic lymphatic leukæmia requiring (hypothetically) a three-hit rather than a two-hit sequence.

Equally important is the connexion between age-specific death-rates from bone cancer and age. It is possible that there is no genuine cohort effect where incidence (as opposed to death) is concerned[13], and plotting from Case[13] the mean age-specific death-rate from cancer of bones (excluding jaw) for the 1866 and 1871 cohorts against age on log–log scales, we find, from Fig. 4, dependence on $(\text{age})^3$.

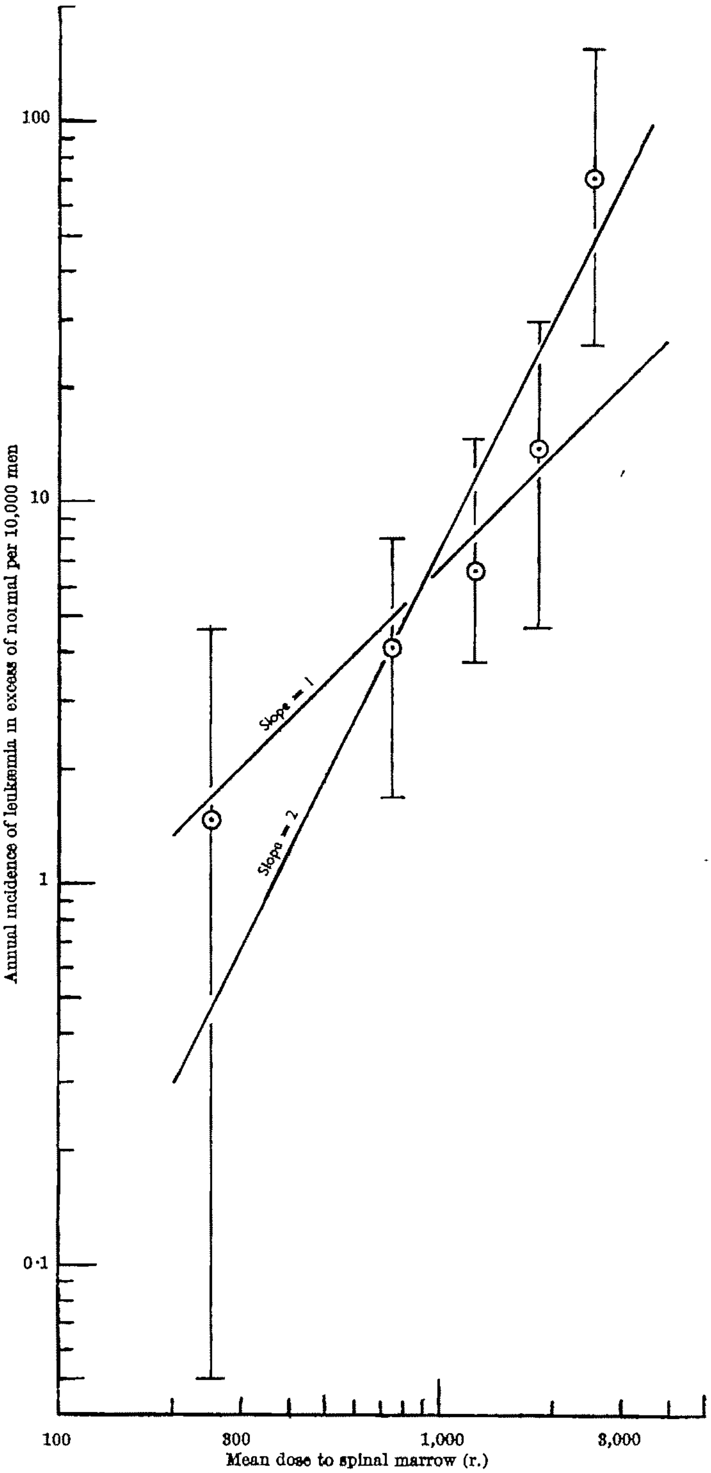

Fig. 1. Annual incidence of leukæmia in excess of normal per 10,000 men, versus mean dose (r.) to spinal marrow. Re-plotted from Court Brown and Doll (ref. 7) on log–log scales. Errors are taken from the original paper and represent 95 per cent confidence limits based simply upon the number of cases. The actual errors will be slightly larger

Further investigation will, however, be necessary to ascertain whether the classification 'bone tumours excluding jaw' refers predominantly to the same type of tumour as that induced by radium in bone. Nevertheless, for bone cancer, as for chronic myeloid

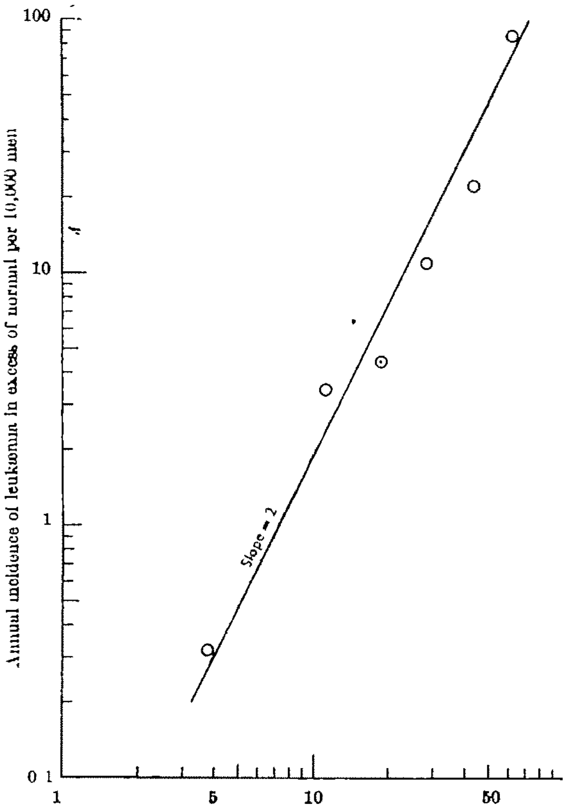

Fig. 2. Annual incidence of leukæmia in excess of normal per 10,000 men versus whole-body integral dose (Mgr.). Re-plotted from Court Brown and Doll (ref. 7) on log–log scales. The errors were not calculated, but they will be similar to, or slightly larger than, those in Fig. 1

leukæmia, it is possible that the natural incidence requires a two-mutation sequence and that radiogenic incidence requires a two-hit process.

Consider now the application of Fisher's theory to radiogenic cancer. Suppose the radiation dose is delivered over a long period (as with background or fall-out) and at a constant rate R rems per unit time.

Suppose m_1 = number of specific first mutations produced per rem, m_2 = number of specific second mutations per rem.

α = growth-rate constant for clones containing 'first-mutation cells'. (Fisher assumes for epithelial tissues that the number of cells in a clone increases in proportion to the square of the time, and we shall adopt the same growth law here.)

It can be shown that dN_2, the number of cells arising containing both specific mutations during a time interval t to $t + dt$ is given by:

$$dN_2 = \tfrac{1}{3}\,\alpha m_1 m_2\, R^2 t^3\, dt \qquad (1)$$

Since the total dose delivered is $D = Rt$,

$$dN_2/dt = \tfrac{1}{3}\,\alpha m_1 m_2\, D^2 t \qquad (2)$$

Thus, on this theory, if a two-mutation sequence is required for carcinogenesis, the rate of radiogenic tumour cell formation will be proportional not only to the square of the dose but also to the time over which it is delivered (provided t is large compared with the time of first-mutation cell division). In the same manner, widely spaced (that is, fractionated) doses should be extremely effective as compared with the same total dose delivered in a short interval.

We shall see later that, in spite of large uncertainties in the evidence, there is no indication that low dose-rates or fractionated doses possess this enhanced efficiency. Indeed, it is much more likely that low dose-rates are, in general, less effective than high.

Fisher's multiple mutation theory seems inapplicable, therefore, to radiation leukæmogenesis in humans, although where there is no cohort effect it offers an attractive interpretation of the dependence of the natural age-specific incidence-rate on age.

Summarizing, certain natural cancers may arise as a result of two or three successive somatic mutations, but radiogenic leukæmia and bone cancer may well originate from two discrete events which have certain properties in common with, but others different from, natural somatic mutations. One is, therefore, led to the conjecture that these discrete events in the radiation case could be chromosome or chromatid breaks. At the same time, it is necessary to assume that, after the first break, clone-growth does not occur, although in the eventual cancer cell the 'break' (gene deletion ?) must produce an effect similar to that of the natural mutation.

Chromosome-break Model

In this model it is assumed that a radiogenic cancer arises from a cell which has received two

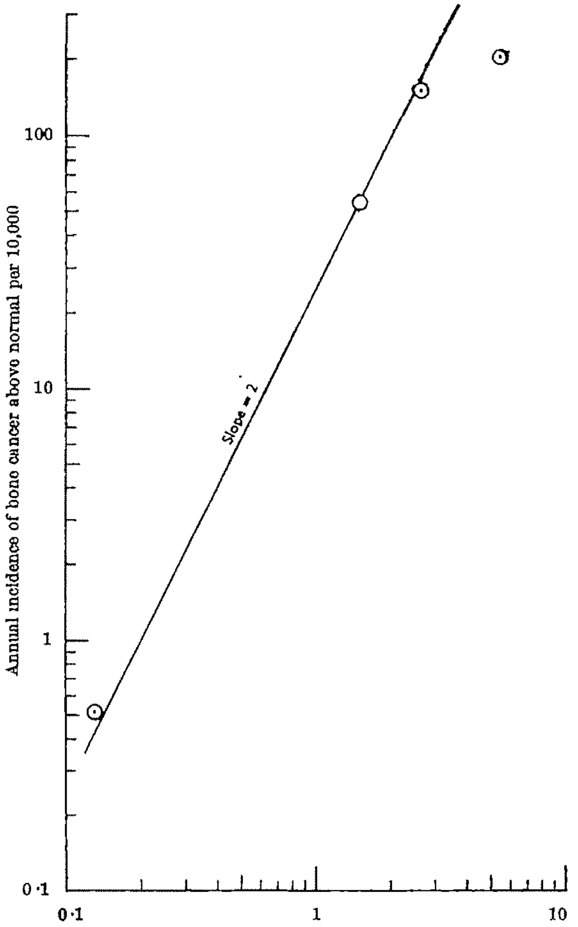

Fig. 3. Annual incidence of bone cancer above normal per 10,000 versus terminal radium burden (μgm. radium-226). Re-plotted on log–log scales from Marinelli (ref. 9). No error estimates were given in the original paper

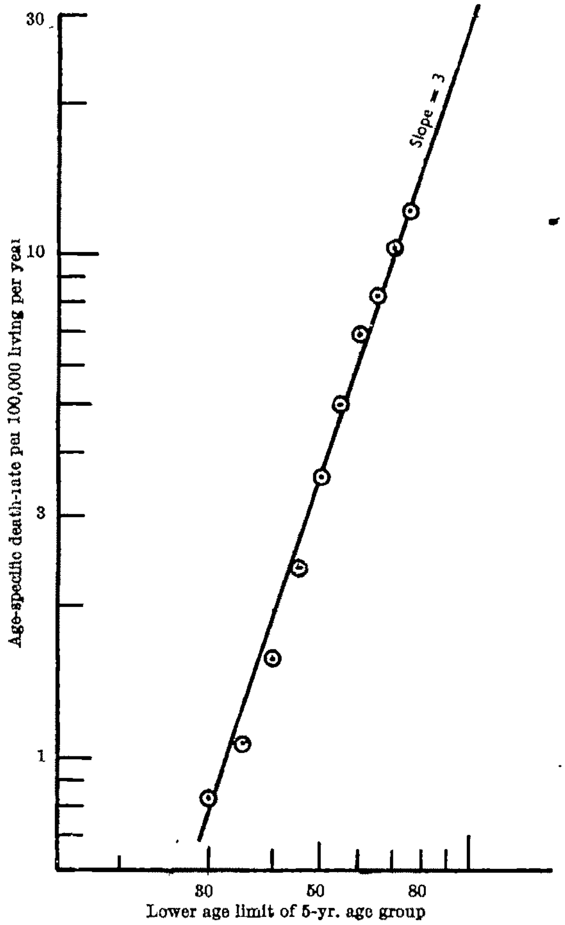

Fig. 4. Mean age-specific death-rate from cancer of bones (excluding jaw) for the 1866 and 1871 cohorts, versus age, on log–log scales. Plotted from Case's (ref. 13) analysis of statistics for England and Wales

specific chromosome breaks. The following detailed suppositions are made:

(*a*) L cells of a particular tissue type are capable of developing into cancer cells.

(*b*) They are irradiated at a constant dose-rate of R rems per unit time.

(*c*) c_1 is the average number of specific first chromosome breaks produced per cell per rem.

(*d*) Cells containing a 'c_1' break may be rendered carcinogenically ineffective through natural processes (such as repair or cell death), or through further radiation injury (such as another chromosome break) leading, perhaps, to cell death. The natural processes of elimination are characterized by a simple exponential function with decay constant λ (though the function could well be multiple exponential, Gaussian, or of some other form). p, the number of lethal radiation hits per 'c_1–type cell' per rem characterizes the radiation injury.

(*e*) c_2 is the average number of specific second chromosome breaks produced in a 'c_1–type' cell per rem.

(*f*) A long interval can elapse between the production of a potentially cancerous cell and the actual development of a cancer. If during this period, or a part of it, cancerous potentialities are carried by only one cell, the receipt of a further radiation 'hit' (producing, for example, another chromosome break) could be lethal to that cell. q is the number of such lethal hits per potentially cancerous cell per rem.

If the irradiation time is short so that a potentially cancerous cell cannot undergo division during the irradiation, it can be shown that the number, N_2, of potentially cancerous cells is given by:

$$N_2 = \frac{Lc_1c_2R^2}{\lambda + pR}\left\{\frac{1 - e^{-qRt}}{qR} + \frac{e^{-(\lambda + pR)t} - e^{-qRt}}{\lambda + R\,(p - q)}\right\} \quad (3)$$

(In solving the differential equations imposed by the assumptions, it is further assumed that at the commencement of the irradiation there are no c_1- or c_2-type breaks in any of the L cells.)

(*g*) If a potentially cancerous cell divides shortly after its production and cancerous potentialities are transmitted to both daughter cells, the chance of both cells being eliminated by subsequent radiation damage is very much reduced. If the 'vulnerable period' (τ) between the initial production of the potentially cancerous cell and its effective multiplication is short (such that $qR\tau \ll 1$), q-type lethal hits can be disregarded. For protracted irradiations under these conditions we obtain:

$$N_2 = \frac{Lc_1c_2R^2}{\lambda + pR}\left\{t - \frac{1 - e^{-(\lambda + pR)t}}{\lambda + pR}\right\} \quad (4)$$

The significance of equations (3) and (4) is best understood with reference to various limiting conditions. Consider first the dose–response relationship for small doses delivered at a high dose-rate, so that the following conditions obtain:

$$pR,\ qR \gg \lambda$$

$$\lambda t,\ pRt,\ qRt \text{ (that is, } pD \text{ and } qD) \ll 1$$

Equation (3) will be applicable and it reduces to:

$$N_2 = Lc_1c_2D^2/2 \quad (5)$$

If, however, a small dose is delivered at a low dose-rate over a very long period (as with background and fall-out radiations) such that $\lambda t \gg 1$, $\lambda \gg pR$,

$$pD,\ qD \ll 1$$

equation (4) reduces to:

$$N_2 = Lc_1c_2R^2t/\lambda = Lc_1c_2D^2/\lambda t \quad (6)$$

Under these conditions, cancer incidence will be less than that observed for the same dose delivered at high dose-rate in the ratio of $2/\lambda t$ ($\lambda t \gg 1$).

Consider now the effect of a large dose delivered at a high dose-rate in a short time,

$$\text{that is, } pD,\ qD \not\ll 1$$
$$pR \gg \lambda$$

Equation (3) is applicable, and it has been shown above for small doses at a high dose-rate that N_2 is proportional to D^2. As pD and qD increase with increasing dose, they will become an appreciable fraction of unity, and N_2 will fall below proportionality to D^2. In the limiting case where pD, $qD \gg 1$, N_2 reaches a plateau:

$$N_2 \rightarrow \frac{Lc_1c_2}{pq} \quad (7)$$

The remaining case to consider is the delivery of a large dose over a long period.

$$t \gg 1,\ \lambda t \gg 1,\ pD \gg 1$$

Equation (4) applies and it simplifies to:

$$N_2 = \frac{Lc_1c_2R^2t}{\lambda + pR} = \frac{Lc_1c_2D^2}{\lambda t + pD} \quad (8)$$

Before proceeding to a rough estimate of the constants in these equations, and in order to relate N_2 (total incidence) to observed incidence-rates, it is necessary to consider some of the possible biological processes involved in carcinogenesis.

Carcinogenesis : Possible Mechanisms

We have seen that on Fisher's multiple mutation theory the dependence of the natural age-specific incidence-rate on age for chronic myeloid leukæmia and for bone cancers can be understood if two successive somatic mutations are required within the same cell. It is also possible that radiogenic leukæmia and bone cancers result from two chromosome or chromatid breaks within the same cell : these breaks could produce gene deletion. It is tempting to conclude that the two mutations and the two breaks have a similar effect on the economy of the cell, and that in both cases the modified deoxyribonucleic acid will produce a modified ribonucleic acid synthesis. Modified ribonucleic acid will in turn affect protein synthesis in the cytoplasm.

On the basis of immunological studies, Green[14] contends that malignancy arises through the following stages : initially there is a modification of one or more cytoplasmic specific protein complexes (cell identity markers) ; these modified complexes then elicit an antibody response, to which the cell eventually 'adapts' by losing the modified marker. This loss of marker involves the failure of the normal growth-regulating mechanism and the 'adapted' cell becomes neoplastic. Other evidence points to a rather similar conclusion, that certain proteins essential to normal controlled division are either eliminated (corresponding to Green's antigenic loss) or structurally modified so as to be incapable of functioning normally[15].

Modified protein synthesis could result in irreversible injury of respiration which, Warburg[16] has claimed, is the essential first phase of cancer. The present hypothesis does not, however, predict such a specific form of injury. Thus, although there is no contradiction with Warburg's theory of cancer, the present hypothesis is, in its most important aspects, independent of it.

Osgood[17] argues that a basic dividing cell must generally give rise to one cell which proceeds to differentiate and another basic or primitive cell which is capable of maintaining this process through further division. This normal or 'arithmetic' type of division will occasionally (during growth or after injury) change to 'logarithmic' division in which two basic daughter cells emerge after cell division. Osgood postulates that logarithmic division is normally prevented by an inhibitor which, he suggests, is produced in the adjacent or nearly adjacent differentiated cells. Malignancy is said to result from a lowered concentration of inhibitor, and Osgood claims that a reduction in the life-span of differentiating cells could bring this about.

Although some such homœostatic control must exist, logarithmic growth could arise not only via Osgood's suggested mechanism but also through any appropriate interruption in the feed-back circuit and in particular through the malfunctioning of the 'inhibitor receptors' in the basic dividing cells. (These 'inhibitor receptors' may be equated with Green's cell identity markers.) If a unique two-hit process is involved in radiogenic leukæmia and bone cancer, it would seem that the initiating process is much more likely to involve a modification of the 'inhibitor receptors' than injury to one, or at the most two, differentiated cells. Osgood's explanation in terms of a reduced inhibitor concentration could, of course, apply in certain other situations where, for example, hormonal factors are important.

The biological mechanism of 'two-hit' radiation carcinogenesis favoured here is therefore as follows:

When a viable cell containing a c_1-type chromosome modification receives a c_2-type chromosome (chromatid) break, the resulting cell is potentially carcinogenic. Subsequent cell division will dilute the normal ribonucleic acid and the normal cell identity markers initially present until eventually a cell emerges in which normal markers have been entirely replaced by modified markers. At this stage (or possibly before) the antibody response postulated by Green will be elicited. Adaptation, involving the elimination of all markers, produces the carcinogenic cell.

The number of cell divisions required to attain the necessary dilution of cell markers will be affected by chance. Hence, an irradiation of a group of similar organisms should be followed by a minimum latent period, at the end of which the tumour incidence-rate should show an approximately normal or Poisson distribution in time.

The Hiroshima statistics[18] suggest that this may be true in the case of radiogenic human leukæmia, with peak incidence-rate occurring about seven years after irradiation (Fig. 5). On this hypothesis, the minimum latent period should also be independent of dose, except that heavy doses, by extensive cell destruction, could accelerate cell division among potentially malignant cells and produce a shortening of the minimum latent period. This relative independence of latent period on dose is also supported by the Hiroshima leukæmia statistics.

If the dose-range is low enough so that incidence (N_2) can be expected to be proportional to D^2 (that is, pD, $qD \ll 1$), then beyond the minimum latent period, cumulative tumour incidence and incidence-rate at a given time after the commencement of irradiation should both be proportional to the square of the dose.

Brues's experiments[19], in which the daily probability of bone tumour appearance in mice was observed as a function of strontium-89 dose, support this contention, although previously they have been differently interpreted. Where there is a time overlap between incidence-rate curves at different doses, the probability of incidence at a given time is, within experimental error, approximately proportional to (dose)^2. This is true for both continuous and single injection experiments. The apparent lengthening of the latent period at the lower doses is therefore due, in part at least, to inadequate statistics, for when doses differ by a factor of 10, incidence will differ by a factor of 100 ; consequently, significant increases above the normal or spontaneous incidence emerge much sooner at high doses.

Finkel and Biskis[20], also on the evidence of experiments with mice, conclude that the latent period for the induction of osteogenic sarcomas is independent both of isotope and of dose. If this deduction is true, then according to the present hypothesis two consequences should follow. First, in their Fig. 4, where the slope of the changing tumour-rate is plotted against injected dose (on log–log scales), the curves should have a slope of 2 over the lower dose-ranges. (This follows if N_2 is proportional to the square of the dose and if tumour-rate is distributed in time according to an error function the width of which is independent of dose.) For strontium-90 the slope is slightly less than 2, but for calcium-45 it is slightly more than 2; the data for radium-226 are too few to allow the (steep) slope at low dose to be determined, but at high dose the slope becomes less than unity, implying, as would be expected, that p and q for α-particles are somewhat greater than for β-particles. Secondly, the cumulative incidence of osteogenic sarcomas before death intervenes should at a given time (and at low dose) be proportional to the square of the dose. Judging from Finkel and Biskis's Fig. 1, this relationship, in general, does not hold, although the discrepancy could be explained if, contrary to their deductions, the latent period at high dose is, in fact, reduced.

In connexion with these experiments on mice, it should be mentioned that Marinelli[9] has estimated that at low doses the relative biological effectiveness of α-particles is 4. It is interesting to inquire what combination of radiation damage to the chromosome material could yield this relative biological effectiveness. Some important data concerning the frequency of chromosome and chromatid breaks are assembled in Lea's[31] Table 67, and although they refer to *Tradescantia* microspores they will be used here as a guide. If a two-hit mechanism in the organism consisted of one chromatid break which joined and one which remained unjoinable, the relative biological effectiveness of α-particles (relative to X-rays) can be deduced from Lea's table to be approximately 4.

If radiogenic bone tumours in mice were produced by somatic mutations rather than through breaks in the chromosome material, we should expect the relative biological effectiveness of α-particles to be less than unity. The relative biological effectiveness evidence for radiogenic bone tumours in mice is therefore consistent with the chromosome (chromatid) break hypothesis and at variance with the multiple-mutation theory.

It is not intended to suggest that the present 'two-hit' or 'double-break' hypothesis is applicable to all cases of radiation carcinogenesis; thus in mice, radiogenic thymic leukæmia and ovarian neoplasia may very well be produced by a 'threshold' or generalized-damage mechanism. I hope to discuss the 'threshold' concept on another occasion.

Application of Chromosome-break Hypothesis to Human Leukæmogenesis

The numerical results derived in this section must be treated with the utmost reserve since uncertain data are substituted in an extremely tentative hypothesis. It may be said, however, that the same is true of all the previous estimates of radiogenic leukæmia incidence.

The Hiroshima and Nagasaki leukæmia statistics would be of immense theoretical importance if it were possible to estimate accurately the dose to the survivors. In the absence of detailed information, an attempt has been made to obtain very approximate averages for the Hiroshima survivors using the following procedure. Air doses for γ-rays and fast neutrons were taken from curves prepared by the Health Physics Division of Oak Ridge National Laboratory[32]. The mean attenuation of γ-rays is assumed to be 0·76 in buildings and 0·74 in tissue overlying bone marrow. The mean attenuation of fast neutrons is assumed to be 0·48 in buildings and 0·26 in tissue overlying bone marrow; the relative biological effectiveness for fast neutrons is taken to be 2. Fatalities were very high in the inner zone (0–1,000 m. from the hypocentre) and most of the leukæmia victims were in the region 850–1,000 m.[3]. Here, the average bone marrow dose (assuming a uniform geographical distribution of the population) is found by integration to be 600 rems. Similarly for the zone 1,000–1,500 m., the average is 170 rems. For the zone 1,500–2,000 m., where incidence is expected to be proportional to (dose)^2, the mean square dose has been calculated and found to be nearly 700 (rems)^2; the root mean square dose is, therefore, 26 rems. The mean or root mean square doses are plotted in Fig. 6 versus the mean leukæmia incidence-rate[18] for the period 1950–57 on log–log scales. The points are consistent with the type of relationship predicted by equation (3). That is, at low doses, incidence is proportional to (dose)^2, but at high dose the curve bends over and attains a plateau.

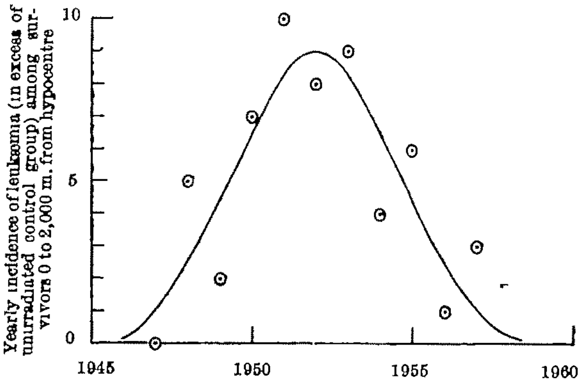

Fig. 5. Yearly incidence of leukæmia in excess of unirradiated control group, among the survivors at Hiroshima who were 0–2,000 m. from the hypocentre, versus year. Plotted from Wald (ref. 18).

If the incidence of radiogenic leukæmia for the lowest dose group is distributed in time according to the smooth curve of Fig. 5, and if no other peaks occur in future years, the total incidence of radiogenic leukæmia for this group is calculated to be 1·5 per 10,000.

From equation (5):

$$Lc_1c_2 = \frac{2N_2}{D^2} = \frac{3\cdot0 \times 10^{-4}}{694}$$
$$= 4\cdot3 \times 10^{-7}$$

Brues[1], on the assumption that leukæmia arises from proliferating myeloid cells, has suggested that L is of the order of 10^{11} cells.

$$\text{Hence } c_1c_2 \sim 4 \times 10^{-18}$$

Assume that c_1 and c_2 refer to two chromatid breaks, one of which is restituted and the other remains broken. If a fraction 0·09 of primary breaks are unjoinable[31], then if c_1 and c_2 are now referred to primary breaks,

$$(c_1c_2)_{\text{primary breaks}} \sim \frac{4 \times 10^{-18}}{0\cdot09 \times 0\cdot91}$$
$$\sim 5 \times 10^{-17}$$

Since c_1 and c_2 are likely to be of the same order of magnitude:

$$c_1 \sim c_2 \sim 7 \times 10^{-9} \text{ specific primary breaks/rem}$$

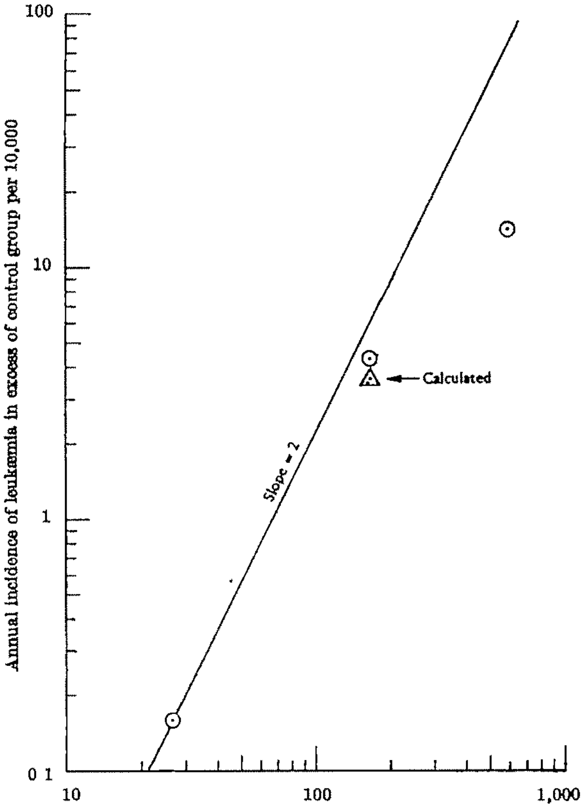

Fig 6. Mean annual incidence of leukæmia at Hiroshima above unirradiated control group per 10,000 for 1950–57, versus mean, or root-mean-square, dose to bone marrow (log–log scales). The leukæmia statistics (circles) are taken from Wald (ref. 18) and the doses are calculated from Ritchie and Hurst (ref. 22) (see text). The point enclosed in a triangle is calculated from the present hypothesis (see text)

On the basis of Lea's target theory[21], this figure is found to correspond to a target molecular weight for each specific primary break of the order of 10^4. This reasonable value contrasts with the absurdly small target volumes entailed by the linear theory of carcinogenesis and commented on by Brues[1].

It is also apparent that if a tumour required for its initiation the co-existence of three specific chromosome (chromatid) breaks in one cell, then for any reasonable values of L, c_1, c_2 and c_3 the chance of a radiogenic tumour arising from doses of the order of 1,000 rems must be exceedingly small. Thus, if and when radiogenic tumours arise from specific modifications to the chromosome material of a single cell, only those tumours are likely to be observed which require two such modifications. (It is possible, however, to account for the occurrence of natural tumours requiring three successive mutations on the hypothesis of clone-growth of mutated cells.)

For the point at highest dose in Fig. 6 it can be shown that equation (7) is a good approximation, hence:

$$pq = \frac{Lc_1c_2}{N_2}$$

From Wald's[18] statistics and the smooth curve of Fig 5, $N_2 = 1{\cdot}39 \times 10^{-2}$ leukæmias per person.

Therefore,

$$pq = \frac{4{\cdot}3 \times 10^{-7}}{1{\cdot}39 \times 10^{-2}} = 3{\cdot}1 \times 10^{-5}$$

If, as is probable, p and q are of the same order of magnitude, $p \sim q \sim 6 \times 10^{-3}$ lethal hits per cell per rem.

This figure may be compared with the values $7{\cdot}2 \times 10^{-3}$ chromatid breaks per cell per r., and 6×10^{-4} chromosome breaks per cell per r., quoted by Lea[21] for the production of aberrations in *Tradescantia* microspores by high-energy X-rays.

The expected incidence-rate for the mid-point in Fig. 6 can now be calculated from the constants derived above, if it is assumed that p is not identically equal to q. (Since R here is very large, it is highly probable that in equation (3), $R\ (p - q) \gg \lambda$. To achieve this it must be assumed, $p \not\equiv q$.) Fortunately, the value of N_2 is not critically dependent on p and q, and putting $p = 6 \times 10^{-3}$, $q = 5 \times 10^{-3}$, we obtain $3{\cdot}6 \times 10^{-4}$ leukæmias per person per year (for the years 1950–57), which is in satisfactory agreement with the observed value of $4{\cdot}3 \times 10^{-4}$.

Finally, the statistics for leukæmia incidence among American radiologists enable a crude estimate of λ to be made. It must, however, be emphasized that differences (for example, in age and sex distributions) between this group and the Hiroshima survivors make the value of such a derivation somewhat dubious. Over the period 1938–52 the average death-rate among American radiologists from radiogenic leukæmia was approximately 4·9 per 10,000 per annum[3]. Deaths within the age-range 35–74 years were recorded and the average expectation of life was 62 years. Assuming equilibrium conditions, then for radiologists older than 35 years, the total expectation of radiogenic leukæmia would have been approximately $(62-35) \times 4{\cdot}9 \times 10^{-4}$, that is, $1{\cdot}32 \times 10^{-2}$. The mean total exposure time to radiation was 24·4 years[3]. Braestrup estimates that the typical exposure dose-rate to radiologists working under poor protection conditions was about 100 r. per annum, corresponding to a dose-rate to the bone marrow of 66 rems per annum[23]. With the subsequent improvement in protection, the marrow dose-rate has now fallen to less than 1 rem per annum. Assuming that equation (8) is applicable, we may take R to be (very roughly) 50 rems per annum. Solving for λ, we obtain the value $1{\cdot}_{75}$ yr.$^{-1}$, but since it depends on almost the square of the (uncertain) dose-rate, the error could, perhaps, amount to one order of magnitude. (This assumes that we are dealing with a simple exponential function—and this assumption might well be false.)

Predicted Incidence of Radiogenic Leukæmia at Low Dose-rates

It is interesting to apply this hypothesis to the incidence of radiogenic leukæmia to be expected from background and fall-out radiations.

Background radiation. The following assumptions are made:

$$R = 0{\cdot}1 \text{ rem/yr.} \quad t = 70 \text{ yr.}$$

$$\frac{Lc_1c_2}{\lambda} = \frac{4{\cdot}3 \times 10^{-7}}{1{\cdot}75} = 2{\cdot}5 \times 10^{-7}$$

(In the absence of better information this is taken to be constant throughout life, although obviously L, at least, will vary considerably.)

Applying equation (5), $N_2 \sim 1{\cdot}7 \times 10^{-7}$.

Thus, neglecting problems of latent period, in a population of 50 million people of average life-expectancy 70 years, background radiation may

Table 1

Radiation	Dose-rate assumed (rems/yr.)	Duration of exposure (yr.)	Incidence-rate of radiogenic leukæmia		
			Linear theory (after Lewis, ref. 3)	Present 'two-hit' theory. Possible range	
Natural background	0·1	70	25,000	1 to 100	per 50 million persons in 70 years (as compared with nearly 200,000 'natural' cases)
Fall-out	0·01	70	2,500	0·2 to 20	
Maximum permissible occupational exposure	5	40	32	0·1 to 10	in a population of 4,000 over a life-time of occupational exposure (as compared with 15 'natural' cases)

The effect of low dose-rate ionizing radiations on radiogenic leukæmia incidence in humans. A comparison between predictions made (*a*) on the basis of the linear theory (after Lewis, ref. 3) and (*b*) by the 'two-hit' hypothesis presented here. For reference, the 'natural' total incidence based on present statistics for England and Wales is shown in the last column

induce of the order of ten cases of radiogenic leukæmia over a 70-yr. period.

This is exceedingly small compared with the 'natural' incidence-rate in Great Britain of about fifty cases per million persons per annum. It is also very small compared with the best predictions made with the linear theory. Thus, Lewis[3] estimates for the 'average' individual in a population that the probability of radiation-induced leukæmia is 2×10^{-6} per rem per annum. Hence, in a population of 50 millions, the total number of radiogenic leukæmias appearing over a 70-yr. period for a dose-rate to each individual of 0·1 rem per annum would be:

$$\simeq 5 \times 10^7 \times 2 \times 10^{-6} \times 0{\cdot}1 \times \frac{70^2}{2}$$

= 25,000 (as compared with a possible range of 1–100 predicted above).

Fall-out radiation. A dose-rate to the individual from internal and external sources of 0·01 rem/yr. will be assumed (this is probably in excess of contemporary dose-rates from fall-out). If this is added to the normal background, and if the influence of other sources of radiation is ignored, the additional incidence, ΔN_2 of radiogenic leukæmia is given by:

$$\Delta N_2 = \frac{Lc_1c_2t}{\lambda}(0{\cdot}11^2 - 0{\cdot}10^2)$$
$$\sim 3{\cdot}6 \times 10^{-8}$$

(According to this hypothesis, ΔN_2 depends upon the normal background dose-rate.) Thus, in a population of 50 million people of average life-expectancy 70 years, an increase of the radiation background from 0·1 to 0·11 rem/yr. should produce of the order of two additional cases of radiogenic leukæmia over a 70-yr. period. Lewis's relationship predicts 2,500 cases under these conditions (Being based on a linear theory, this figure is unaffected by the level of natural background radiation.)

Maximum Permissible Occupational Exposure Dose

In the United Kingdom, the maximum permissible life-time dose to the blood-forming organs of radiation workers is 200 rems. If this dose is spread uniformly over forty working years ($R = 5$ rems/yr.) we find from equation (3) that $N_2 \sim 2{\cdot}5 \times 10^{-4}$ leukæmias per person. Hence, in a population of 4,000, exposed for an occupational life-time at the maximum permissible dose-rate, we should, according to this hypothesis, expect of the order of one radiogenic leukæmia to be induced. On the basis of Lewis's[3] linear relationship, the corresponding figure would be thirty-two cases; at this higher dose-rate the disparity between the two theories is much narrower.

Osteogenic Sarcoma

The available data relating to human osteogenic sarcoma are too scanty to enable numerical predictions to be made for low dose-rate conditions with the present hypothesis.

Before concluding, it should be mentioned that alternative two-break hypotheses can be entertained. We can, for example, conceive a model in which $\lambda = 0$ and c_1 and c_2 are functions of dose-rate (R). Starting from the same statistics of human radiogenic leukæmia, the predictions from such a model would probably not differ greatly from the predictions made here. However, there is no obvious way at present of establishing a relation between c_1, c_2 and dose-rate.

Finally, any plausible alternative to the linear theory is likely to predict a very much lower incidence of radiogenic tumours at low doses and low dose-rates. It is difficult to imagine a realistic hypothesis which would lead to predictions intermediate between linear (one-hit) and quadratic (two-hit) theories, while any 'threshold' theory would be likely to involve an altogether negligible incidence at dose-rates comparable to background.

OBITUARIES

Dr. R. A. Frazer, F.R.S.

The news of the death of Dr. R. A. Frazer at his home in Ockham on December 10 was received with much sadness by his former colleagues at the National Physical Laboratory, and particularly by those who had had the privilege of working with him or under his leadership. His unselfishness, charm, modesty and humour made him a most likeable person and he will be sadly missed by many friends. His scientific ability and distinguished bearing inspired respect in all who met him, and his kindliness won the affection of all those who had the good fortune to know him well.

Dr. Frazer had a brilliant career as a mathematician at Cambridge and was a Rayleigh Prizeman. He joined the staff of the National Physical Laboratory in 1914, his first post being that of assistant secretary in administration. After about a year he was transferred to a group engaged in aerodynamic research in the Engineering Division. This group of pioneers in aeronautics became the nucleus around which the Aerodynamics Division was formed a few years later.

During the first ten years or so of Frazer's career as a research worker, his mathematical talent was put to good use in the study of problems of viscous flow, but from time to time he took part in other investigations. Some of the work he did in connexion with full-scale tests on the airship *R*.38 resulted in his winning the *R*.38 Memorial Prize awarded by the Royal Aeronautical Society.

It was characteristic of him to do everything he attempted with great thoroughness, and he was never satisfied until he had unravelled all aspects of any problem, however complicated, on which he happened to be engaged. He had remarkable power for concentration and when deeply immersed in a problem would lose all sense of time.

It was not surprising that, when aircraft flutter became a serious problem around about 1924, Frazer was asked to investigate what was then a mysterious phenomenon. By wind tunnel tests on simple aircraft models of reduced elasticity, and by analysis, he and his co-workers were soon able to obtain a physical understanding of flutter and to discover methods for its prevention. With W. J. Duncan as co-author he published in 1928 the first flutter monograph, and this is now often referred to as the 'flutter bible'. In this book the phenomenon is clearly explained by reference to simple systems, and the basic theory for the prediction of critical speeds for flutter is fully developed. His study of flutter theory led him to take an interest in matrix algebra for the purpose of analysing complicated systems involving many degrees of freedom. The outcome of this work was a book on "Elementary Matrices", written with Duncan and Collar as co-authors. This is now regarded as a classic on the subject, and it has had a profound world-wide influence on the development of methods of flutter and vibration analysis and on the general theory of aero-elasticity.

In recognition of his outstanding work he was elected a Fellow of the Royal Society in 1946. He was also a Fellow of the Royal Aeronautical Society and of the Institute of the Aeronautical Sciences, and was a member of the Oscillation Sub-Committee of the Aeronautical Research Council. Formerly he was also a member of the Mechanics Committee.

Immediately after the Second World War, the National Physical Laboratory was asked to investigate the possibility of wind-excited oscillations of suspension bridges, in connexion with the proposal to erect suspension bridges across the Severn and the Forth. It was feared that, like the Tacoma bridge, these bridges would fail unless they were properly designed to avoid such instability. Again it was Dr. Frazer who took responsibility for the investigation. With the assistance of C. Scruton and other members of the Division, he designed and made a 50-ft. long reduced elasticity model for testing in a specially erected wind tunnel at Thurleigh. In due course they were able to reproduce on the model the kind of oscillation that destroyed the Tacoma bridge and show how it could be avoided by suitable design. As a result of their investigations they were able to propose a design for the Severn and Forth Suspension Bridges which was not prone to instability in the strongest winds. A bridge to this design is now being built over the Firth of Forth.

Outside his work, Dr. Frazer had many interests. In his younger days he was a keen mountaineer and enjoyed nothing better than climbing in the Alps, the Lake District and North Wales. He was also a member of Oxford University Expeditions to Spitsbergen in 1921, 1923 and 1924. In later years his main interest was gardening. When he retired in 1954 after forty years service, everyone hoped that he would have good health to enjoy a long and happy retirement with his family, but this was not to be.

Dr. Frazer's name will live long in aeronautical history, and he will always be remembered with esteem and affection by many friends who feel the deepest sympathy with his wife and family in their bereavement W. P Jones

Prof. Anrezej Soltan

The death has been announced of Dr. Anrezej Soltan, director of the Polish Institute of Nuclear Research since 1955. Born in 1897, Dr. Soltan was a member of the Scientific Council, Joint Institute for Nuclear Research, Dubna, U.S.S.R., a member of the Polish Academy of Sciences, and he held the position of chairman of the Central Administration of the Polish Physical Society during 1952–54.

Soltan was educated at the University of Warsaw and carried out scientific work in France during 1927–28 and in the United States during 1932–33. His publications cover the fields of spectroscopy, physical chemistry of hydrogen and mercury vapour, the interaction of fast neutrons with atomic nuclei and the isomeric radioisotope of bromine.

After the War he became professor at Lodz Polytechnic (1945–47), returning to the University of Warsaw as professor of experimental physics (1947–48) and then as professor of atomic physics.

Dr. Soltan was a delegate at the Second International Conference on the Peaceful Uses of Atomic Energy at Geneva in 1958 and was a member of the State Council for the Peaceful Uses of Nuclear Energy.

NEWS and VIEWS

The Agricultural Research Council: Sir William K. Slater, K.B.E., F.R.S.

Sir William Slater will be retiring on June 30 from the secretaryship of the Agricultural Research Council, a post which he has filled with great distinction during the past eleven years. On graduating in chemistry at the University of Manchester, Sir William did research under Prof. Lapworth and for three years he was an assistant lecturer in the University. After two years in industry, he joined Prof. A. V. Hill at Manchester to assist in his work on muscle physiology. In 1923 he was awarded a Beit Memorial research fellowship and worked in the Department of Biochemistry of University College, London, under Sir Jack Drummond, where he developed a pioneer line of research on the biochemistry and physiology of insects, particularly anaerobiosis. In 1928 he went to Dartington Hall as scientific adviser to the trustees. Afterwards, he took charge of the agricultural and rural development on the estate and established a laboratory for applied research. In 1943, Sir William joined the staff of the Ministry of Agriculture, Fisheries and Food as secretary of the Agricultural Improvement Council for England and Wales, which had just been set up. He became responsible for the development of that Council's work, and had much to do with fostering the close relationship which exists between it and the Agricultural Research Council. Later, he became in addition senior advisory officer, responsible for setting up the specialist scientific section of the National Agricultural Advisory Service. This broad experience qualified Sir William well for the post of secretary of the Agricultural Research Council to which he was appointed in 1949. During his term of office he has brought to a successful conclusion a ten-year post-war programme for the development of agricultural research approved by the Cabinet in 1945. In 1947–48 the amount spent by the State on agricultural research was of the order of one million pounds; to-day it amounts to about six million pounds. New institutes have been created and existing ones have been expanded. Links with universities have been strengthened by the establishment of a number of units in university departments. The Council has indeed been fortunate in having the services of Sir William Slater over this period, and his wise guidance and never-failing patience will be missed.

Prof. E. G. Cox, F.R.S.

Prof. Ernest Gordon Cox, who will be succeeding Sir William Slater as secretary of the Agricultural Research Council on July 1, 1960, comes originally from Somerset. He was born at Bath in 1906 and educated at the City of Bath Boys' School and the University of Bristol, from which he graduated with first-class honours in physics in 1927. From Bristol he went as research assistant to Sir William Bragg at the Royal Institution during 1927–29 and there began the series of researches which transformed his formal field of interest from physics to chemistry. During 1929–45 he held appointments in the Department of Chemistry of the University of Birmingham, and in 1945 was appointed professor of inorganic and physical chemistry at the University of Leeds; his title was changed in 1953 to professor of inorganic and structural chemistry in a perhaps hopeless attempt to define more precisely the many-sided implications of his researches. He was one of the first to apply X-ray methods to solve problems in the stereochemistry of metal co-ordination compounds. But he has also made many contributions in organic chemistry, from his early work on α-chitosamine hydrochloride and hydrobromide, which established, by direct X-ray analysis, the existence and form of the pyranose ring in sugars, to his latest, very accurate, studies, with D. W. J. Cruikshank and others, of the electron distribution in benzene. In recent years his School of Chemistry has made Leeds an international centre to be visited by all interested in exact X-ray analysis. At the same time he has had much to do with problems of organization and administration, first in war research and later, in Leeds City and University; for the last three years, as chairman of the X-ray Analysis Group, he has been concerned with the practical applications of X-ray methods in many different fields. His variety of experience and knowledge, his own personal interest in agricultural problems (he is a serious amateur botanist and ornithologist) and his generous spirit should be of the greatest value in guiding agricultural research.

Building Science at Sheffield: Prof. J. K. Page

Mr. J. K. Page, at present lecturer in environmental physics in the Department of Building Science of the University of Liverpool, has been appointed to the newly created chair of building science in the University of Sheffield. Mr. Page was educated at Haileybury College and the University of Cambridge, where he gained first-class honours in Part I of the Natural Sciences Tripos. After graduation, Mr. Page held a temporary appointment with the Council of Industrial Design, where he assisted with plans for the Festival of Britain. After teaching at Westminster School for two years he took an appointment as senior scientific officer in the Colonial Liaison Section at the Building Research Station. During this appointment Mr. Page travelled extensively in West Africa, America and the West Indies. After a period as chief research officer of the Nuffield Foundation Division of Architectural Studies, Mr. Page was appointed to his present post in the University of Liverpool in 1957.

Royal Astronomical Society Awards

Awards of medals have been made to the following by the President and Council of the Royal Astronomical Society: *Gold Medal* to Prof. V. A. Ambartsumian, president of the Academy of Sciences and director of the Byurakan Observatory, Armenia, for his numerous important contributions to both theoretical and observational astronomy; *Eddington Medal* to Dr. R. d'Escourt Atkinson, deputy chief scientific officer at the Royal Greenwich Observatory, for his pioneering papers on atomic synthesis and stellar energy; *Jackson Gwilt Medal and Gift* to Mr. F. Maine Bateson, of Cook Islands, and Mr. A. F. A. Lofley Jones, of Timaru, New Zealand, for their work on variable stars in the southern hemisphere.

British Association: Installation of President

The installation on January 8 of Sir George Thomson as president of the British Association for 1960 (see *Nature*, 184, 151; 1959) marked the close of a year of increasing activity and encouraging and significant developments. The lecture service, in its infancy in January 1959, is now well under way. Some 500 scientists have agreed to give lectures, and their audiences run into five figures—around 22,000 adults from trade unions, rotary clubs, women's institutes and chambers of commerce, and 32,000 children from all types of schools. The three pioneer area committees of 1958 have been joined by twelve more; the last of these, in York, is a direct follow-up of the recent annual meeting there. The decision to make a number of fundamental changes in the quarterly journal of the Association was also taken during the past year. From May 1960 *The Advancement of Science*, in a completely revised format, will be published six times a year, instead of four. Though still containing papers delivered at the annual meeting, the journal will include much new material, and will be of an essentially non-specialist character, aimed to appeal to scientists working in other fields, students and sixth forms in the schools, and laymen who are anxious to understand something of the significance of scientific research and development. The wide potential circulation of such a journal should make it a powerful weapon in the Association's campaign.

Nuclear Energy Conferences and Symposia in 1960

The International Atomic Energy Agency, Vienna, has issued a provisional schedule of meetings to be organized in 1960. One large conference will deal with Radioisotopes in Physical Sciences and Industry and will probably be held at the end of August. The last major isotope conference, apart from the sessions devoted to this subject at the Geneva Atoms for Peace Conference in September 1958, was organized in Paris in September 1957 by Unesco, which will co-operate in the 1960 isotope conference. Another scientific conference will deal with problems of medium and small-size reactors and is planned for the beginning of September in Vienna with the expected participation of the United Nations. The tentative list of symposia to which invitations will be extended to all the Agency's Member States is as follows: (1) Fuel Element Fabrication with Special Emphasis on Cladding Materials (May 3–6, in Vienna); (2) Radiation Dosimetry in Physical Sciences (June 7–13, in Vienna); (3) Effects of Ionizing Radiation on Seeds and its Significance on Crop Improvement (probably in Karlsruhe, August 8–12, in co-operation with the Food and Agriculture Organization); (4) Inelastic Scattering of Neutrons in Solids and Liquids (October 11–14, in Vienna); (5) Neutron Pile Research (October 17–21, in Vienna); (6) Chemical Effects of Nuclear Transformation (October 24–27); (7) Nuclear Ship Propulsion with Special Reference to Safety (mid-November; the arrangements will be worked out in consultation with the International Maritime Consultative Organization); (8) Experimental and Test Reactors (November 28–December 2, in Vienna); (9) Pest Control by Radiation (probably in India in December, in co-operation with the Food and Agriculture Organization); (10) Use of Radioisotopes in the Study of Endemic and Tropical Diseases (in the Far East at the end of November or beginning of December, in co-operation with the World Health Organization); (11) Education and Nuclear Energy (probably in Argentina at the end of the year or beginning of 1961, in co-operation with Unesco).

Scientific Man-power in Britain

In an article, "The Statistics of Scientific Manpower", in the January 7 issue of *Education*, Sir Solly Zuckerman points out that the figures since published by the Scientific Man-power Committee, which were not available to Prof. J. Jewkes when he presented his analysis of the marked shortage of scientists before Section *F* (Economics) of the British Association at York last September, indicate that the conclusion drawn by Prof. Jewkes is wide of the mark. Graduates in pure science from British universities during 1956–59 numbered only 15,500, and not 18,000 as he stated, and even taking into account about 800 scientists, not considered by Prof. Jewkes, who were admitted to membership of the Royal Institute of Chemistry or the Institute of Physics on the strength of qualifications other than a university degree, when allowance is made for those who returned to their homes overseas or took up employment abroad (about 500) and for the 5,000 needed to replace losses, we are left with about 10,800 to satisfy any net increase in demand expected between 1956 and 1959 (11,700 in the 1956 estimate).

The Scientific Man-power Committee's recent report also shows that there were still about 4,000 vacancies at the beginning of 1959. The new estimates made by employers themselves of the number of scientists they will require by 1962 suggest that the general market shortage of scientists is still likely to be about 2,000 in 1962. Commenting further on Prof. Jewkes's 'working rule' that employers know best about their future requirements, Prof. Zuckerman also points out that the demand between 1956 and 1959 rose much more sharply than employers anticipated, and that in practically no branch of industry did action follow intention. We have still far to go before we need be unduly concerned about the exhortatory character of Prof. Jewkes's concept of 'unmet need'; but the Scientific Man-power Committee would certainly agree wholeheartedly with him that the criteria now available for estimating how many scientists and technologists will be needed in the long-term are very crude and urgently need to be refined.

Computation and Automatic Control

At the annual general meeting of the British Group for Computation and Automatic Control of the British Conference on Automation and Computation, held on December 17, 1959, the Executive Committee was reconstituted for 1960 as follows: *chairman*, Mr. J. F. Coales; *vice-chairmen*, Mr. R. Hindle and Mr. H. W. G. Gearing; *honorary treasurer*, Mr. S. M. Rix; *honorary secretary*, Mr. W. Bamford; *members*, Dr. A. D. Booth, Mr. N. Clarke, Mr. E. C. Clear Hill, Mr. W. C. F. Hessenberg, Mr. N. C. Pollock, and Prof. E. J. Richards. Groups *A* and *B* have undertaken the sponsoring of the British contribution to the First Congress of the International Federation of Automatic Control which is being held in Moscow during June 27–July 6. Further details can be obtained from the Honorary Secretary, Group *B*. Arrangements are being made also for a British Convention on this subject to be held in London in September, and further information can be obtained from the Honorary Secretary, Group *A*. The address of both honorary secretaries is, the British Conference on Automation and Computation, c/o Institution of Electrical Engineering, Savoy Place, London, W.C.2.

Post Office Engineering-Apprenticeship Scheme

IT was announced in Parliament by Miss Mervyn Pike, Assistant Postmaster General, that the Post Office is engaged in an expanding nation-wide programme of mechanization and automation. To enable it to carry this through, men will be required to train for key engineering-posts. A scheme is being launched under which university training or a diploma in technology course at a college of advanced technology will be guaranteed to about twenty students. During the student apprenticeship, including the time of attendance at university or college, salaries will be paid according to age, and varying from £270 per annum at seventeen to £430 at twenty-one and over. Student apprentices will be selected from young men of British nationality who are between the ages of seventeen and twenty on June 1 in the year when apprenticeship starts. The university or college studies will start in September/October of the year after apprenticeship begins. The student apprenticeship will last 4½ years, except in Scotland and Northern Ireland, where it will be slightly longer to allow for the duration of university courses. Further information can be obtained from the Engineering Chief (O.51), Post Office Engineering Department, 2–12 Gresham Street, London, E.C.2. Applications for 1960 must be submitted by February 26.

National Science Foundation : Science Faculty and Senior Postdoctoral Fellowship Awards for 1960

THE National Science Foundation has awarded 285 Science Faculty Fellowships in the sciences for the fiscal year 1960. These fellowships are offered as a means of improving the teaching of science, mathematics and engineering in American colleges and universities, and their primary purpose is to provide an opportunity for college and university science teachers to improve their work as teachers. Candidates must have a first degree or its equivalent, demonstrated ability and special aptitude for science teaching and advanced training, and three years of full-time science teaching at the college-level. There were 762 applicants from all parts of the United States and its territories.

The Foundation has also announced the award of 75 Senior Postdoctoral Fellowships in the sciences for the fiscal year 1960, selected from 259 applicants. These Fellowships were awarded to scientists of demonstrated ability and special aptitude for productive scholarship in the sciences. Twenty-eight awards were made in the life sciences, and forty-seven in the physical sciences.

High Mach Number Air-breathing Machines

THE Combustion and Propulsion Panel of the Advisory Group for Aeronautical Research and Development, North Atlantic Treaty Organization, will hold its fourth colloquium in Milan during April 4–9. The meeting will be devoted to discussions on "High Mach Number Air-breathing Engines". The opening session will consist of a round-table discussion on "The Future of Air-breathing Engines". Invited papers from Germany, Italy, the United Kingdom and the United States will deal with: (1) performance and applications, (2) hypersonic inlet studies, (3) supersonic combustion and detonation, (4) nozzle flow with chemical reactions, (5) rotating machinery, and (6) high-temperature material problems. Although the meeting is unclassified from a security point of view, attendance is limited to those who are authorized to attend by either the Group national delegates, or by members of the Combustion and Propulsion Panel.

Ford Foundation Grant to Cern

THE European Organization for Nuclear Research has received from the Ford Foundation a grant amounting to five hundred thousand dollars to cover a period of four years The facilities available at Cern now consist of two big particle accelerators, a 600 MeV. synchrocyclotron and a 28,000 MeV. proton synchrotron. The latter, the most powerful of its type in the world, has recently started operating with outstanding success. This grant follows a previous one of four hundred thousand dollars contributed by the Foundation in 1956 to cover similar expenses during four years.

Announcements

IT is announced that Cornelius Lanczos, senior professor in the School of Theoretical Physics at Dublin Institute for Advanced Studies, has recently been awarded the Chauvenet Prize by the Mathematical Association of America for an article entitled "General Theory of Linear Differential Operators". This article is to form the last chapter of a book which is to be published by Van Nostrand, entitled "Linear Differential Operators", by Prof. Lanczos.

MR. P. N. HARVEY has been appointed farm director at Gleadthorpe Experimental Husbandry Farm, Notts., of the Ministry of Agriculture, Fisheries and Food, in succession to Mr. P. J. Jones, who has been transferred to Bridget's Experimental Husbandry Farm.

PROF. MICHAEL POLANYI, emeritus professor of social studies in the University of Manchester, will give the 1960 Eddington Memorial Lecture in Cambridge at the Arts School Lecture Theatre, Bene't Street, on February 16, at 5 p.m. The title of his lecture is "Beyond Nihilism".

THE McCrone Associates of the United States are sponsoring a National Microscopy Symposium which will be held at the Del Prado Hotel in Chicago during June 13–15. The Symposium will cover (1) Instrumentation, (2) Methods and Techniques, and (3) Applications. Further information can be obtained from Walter C. McCrone Associates, 501 East 32nd Street, Chicago 16, Illinois.

Nos. 7, 8 and 9 of the Bibliography of Scientific Publications of South and South-East Asia, for July, August and September 1959, respectively, compiled jointly by Unesco Science Co-operation Offices for South and South-East Asia and published by Insdoc, National Physical Laboratory, New Delhi, contain a further 1,660 classified entries, together with author index, and the August issue includes also the Index to Vol 4 (1958).

ERRATUM. In the communication entitled "Isolation of 2-Aminoethane Phosphonic Acid from Rumen Protozoa", by M. Horiguchi and M. Kandatsu, in *Nature* of September 19, p. 901, Fig. 1 has unfortunately been inverted.

THE WILDFOWL TRUST

THE report* of the Wildfowl Trust for 1957–58 describes the administrative activities of the staff, the state of the accounts (satisfactory), the growth in membership (from 5,094 in 1957 to 5,320 in 1958), the work of scientific members of staff during the year, as well as investigations and observations of wildfowl by many well-known correspondents throughout the world. One of the latter is an interesting account by Eric Fabricius, of the University of Stockholm, of the mechanisms which make plumage waterproof. Fabricius found that ducklings of several species lost their waterproofing on a diet consisting of raw crushed fish, and regained it on a diet of insects; even in specimens that had lost their waterproofing there were indications that the oil gland was functioning.

The oil gland was removed from fourteen young tufted ducks just after hatching, while their down feathers were still enclosed in their isolating horny sheaths. After bursting of these sheaths and the full development of the down, the plumage was as repellent to water as that of the normal control birds, indicating that it is not the secretion of the oil gland which makes the plumage waterproof.

Operated and normal control birds alike lost their waterproofing when subjected to contact with smearing substances. In this condition the barbules of the down feathers were disarranged, sticking together in groups, between which were irregular spaces. The normal waterproofing was gradually restored if the birds were allowed to preen. Plumage remains water-repellent when birds feed on insects because insects are dry and clean. Plumage even remains water-repellent on a diet of fish, provided that the pieces of fish are only given to the birds while these are swimming in clean water. The preening consists of a number of stereotyped movements. The nibbling type of preening movements, in particular, aid in maintaining the barbules in a state which makes the plumage repellent to water. These findings confirm the view of Marsden that the large amount of finely distributed air among the ramifications of the feathers is the principal factor in the water-repellency of plumage.

The causes of death of birds at Slimbridge during 1955–57 have been analysed by A. R. Jennings, of the University of Cambridge. Of the 680 birds examined, the largest number of deaths were due to the high incidence of acute pulmonary congestion and pneumonia among very young birds. Sudden lowering of the air temperature often associated with heavy rainfall brings about this pulmonary syndrome, which is often referred to as 'chilling'. This type of acute respiratory disease is a common cause of high mortality in free-living species, and the same conditions seem to apply even under conditions of semi-captivity. The changes at post-mortem are quite typical and comprise acute congestion and œdema of the lungs, an enlarged gall bladder full of viscous bile and usually an unabsorbed yolk sac. In all, 138 birds died from various infections. Aspergillosis was the most frequent with 117 cases, the predilection sites for the fungus being the lungs and air sacs. The lesions were usually typical fungal granulomata, but in some birds there was an acute diffuse pneumonia. Tuberculosis was the next most common disease, and eight cases were seen.

One of the main objectives of the research programme at Slimbridge has been to obtain a better understanding of the taxonomy of the Anatidæ. All the work has now been surveyed by Dr. G. U. T. Matthews, the assistant director of the Trust, who shows that a whole variety of techniques are open to the modern taxonomist. Many of these techniques are incapable of assessing relationships below the family level and are only of passing interest when concerned with relationships within a family. It is beginning to appear that the Anatidæ is an unusually homogeneous and closely knit family.

What makes the report outstanding, of course, is the revealed and hidden imprint of Peter Scott, the director. His sketches lose none of their attractiveness with the years; they may even excite more interest as they become more audacious. The many photographs are included only if they illustrate the work of the Trust and do so with adornment; not one of them is below standard. With a report of such high quality it is to be hoped that the activities of the Inland Revenue authorities may not, as is feared, lead to the production of future reports in an attenuated form.

DAIRY RESEARCH IN SCOTLAND

THE recent triennial report of the Hannah Dairy Research Institute* gives a clear picture of the expansion of the Institute's activities in the past three years. New laboratories have been built, and greatly increased facilities have been added to those formerly available for metabolic studies. The work reported continues to reflect the aims defined when the Institute was founded some thirty years ago.

Among several important additions to the Institute is a splendidly equipped climatic laboratory. This has been constructed, with capital provided by the Colonial Office, and is being used for studies on the effect of climate on the physiology of cattle. The laboratory includes a room in which a cow or steer can be maintained at any temperature from 0° to 60° C. within ± 0·1° C., and at a relative humidity within ± 1 per cent over a wide range. A second room houses four cattle with slightly less critical control of environment. Metabolism houses have also been constructed for sheep and cattle. These contain six new closed-circuit respiration chambers for sheep and one for cattle, and provision is also made for twenty-four sheep metabolism cages. With their unique equipment and instrumentation the climatic and metabolism buildings are a notable example of collaboration between biologists, physicists and engineers.

---

* Hannah Dairy Research Institute. Report for the Three Years ended March 31, 1959. Pp. 52.

The Grass and Dairy Husbandry Department has continued its investigation of the intensive management of a largely grassland dairy farm. Purchases of fertilizer rather than concentrates continue to show a high return, and the Ayrshire herd averaged 800 gallons a year with one cow per 1·8 acre. The choice of forage species and strains, coupled with suitable management and fertilizer treatments, is being studied in extensive plot and feeding experiments. In the Biochemistry Department fundamental studies are in progress concerning the chemistry of milk protein and the vitamins and enzymes of milk. Attention has been given to factors influencing the important riboflavin and vitamin A components of milk, to the synthesis of lysine in the rumen and to the effect of thyrotropin and growth hormone on milk yield.

The construction of new equipment has not prevented the Nutrition Department from continuing its important studies on energy metabolism. These have shown that above the maintenance-level the utilization of mixtures of volatile fatty acids by sheep decreases with decreasing chain-length, being as low as 30 per cent with some mixtures rich in acetic acid. In ruminants almost all dietary carbohydrate is absorbed as these short-chain acids, and world-wide interest has been aroused by this first step in the reconciliation of classical energy studies with recent developments in ruminant nutrition.

Other work with sheep has been concerned with the effects of environmental temperature and clipped fleeces on energy metabolism, the influence of the physical state of roughages on their net energy and the role of vitamin E in muscular disease. Cow-feeding experiments suggested that the allowance of concentrates per gallon of milk should increase at higher yields.

The Physiology Department is concerned with the physiological responses of cattle to climatic stress. While aimed at the improvement of cattle productivity in hot countries, this work must also provide fundamental information of value in studies on housing in Britain. Two small chambers have been used for investigating the physiology of panting; the thermal stimulus to panting was found to be effective, in calves, only on the skin or upper respiratory tract. The ability to reduce tidal volume with increasing thermal stress appeared to be associated with high heat-tolerance as indicated by rectal temperature.

The validity of rectal as a measure of deep body temperature, the effects of heat stress on the blood and the role of the skin in loss of heat were also investigated. Important studies on the rate of acclimatization of calves to heat are now being extended to cows.

The Department of Veterinary Pathology studies both practical and applied aspects of mastitis. Histological examination of udders from infected cows, the incidence on farms of different types of mastitis and the relationship between the Whiteside test and cell counts have all been considered.

The Bacteriology Department has been largely concerned with the important *coli-aerogenes* bacteria of milk and with the application of the coliform test. Demand for sterilized milk in cities has prompted investigation of the spore-forming bacteria of such milk and of tests for effective 'sterilization'.

Many practical aspects are also dealt with by the Department of Technical Chemistry. Welcome collaborative studies are reported on the accuracy of various analytical methods for milk, and these have led to revision of the formula for the calculation of solids-not-fat content by means of the lactometer. Feeding trials indicated that with spring grazing the usual increase in milk protein is probably due more to an improved plane of nutrition than to an increase in any particular component of grass. Long-term studies have dealt with factors influencing the coagulation of casein, a problem in the manufacture of dairy products, and with the production, preservation and storage of dried milk. A new system was developed for the fractionation of the carbohydrates of roughages.

Readers of this report are provided with a ready reference to more detailed information by the liberal inclusion of relevant reprint numbers.

CORRELATION OF AUDIO-FREQUENCY ELECTROMAGNETIC RADIATION WITH AURORAL ZONE MICROPULSATIONS

By DR. J. AARONS
Electronics Research Directorate, Air Force Cambridge Research Center
AND
G. GUSTAFSSON and A. EGELAND
Kiruna Geophysical Observatory

DURING three periods of approximately one month each, continuous recordings were taken of the electromagnetic energy in the spectrum region of 10 c.p.s. to 10 kc.p.s. The detection equipment was a 10-m. vertical antenna, a swept frequency battery-operated spectrum analyser and a recording milliammeter. The frequency analyser had two ranges; it first swept through its lower range of 10–1,000 c.p.s., with a 1 c.p.s. band-width. A second sweep was then initiated to go from 500 c.p.s. to 10 kc.p.s. with a 40-c.p.s. band-width. A total time for a complete recording of both of the sweeps was 32·8 min. The equipment was housed at an isolated area about 2 km. from the nearest 50 c.p.s. power line. An example of the registration of the higher-frequency range is given in Fig. 1.

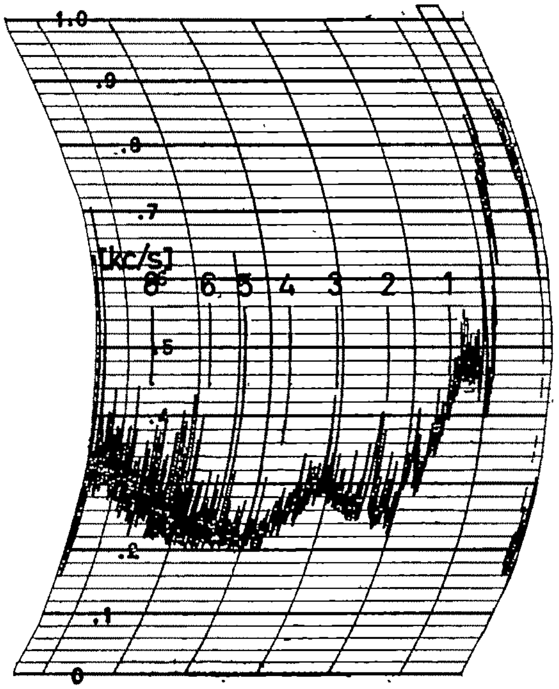

Fig. 1. Recording of the electromagnetic radiation of December 5, 1828 to 1839 M.E.T., 1958, in the frequency range 0·5–10 kc./s.

The aim of the programme carried out near the Kiruna Geophysical Observatory, Sweden (geographic co-ord., 67·8° N., 20·4° E.; geomagnetic co-ord., 65·3° N., 115·5° E.), was twofold, namely: (1) to investigate changes in the background signal-level; (2) detect emission or absorption of energy at the gyro-frequency of solar terrestrial ions.

Several magnetically disturbed periods occurred during the measurement periods October 12–November 11, 1958, December 12, 1958–January 11, 1959, and April 15–May 14, 1959. On eleven occasions electromagnetic radiations associated with micropulsations of the Earth's magnetic field were detected. Two distinct frequency-bands were identified in this low-frequency emission. The lower-frequency emission, in the range 0·5–1·4 kc./s., has been mentioned by Egeland[1] as "noise" during aurora, while the higher-frequency emission, in the range 1·8–4·5 kc./s., was identified by Watts[2] as "hiss". For the lower-frequency emission very little results have hitherto been obtained.

Fig. 2 is a spectrum analysis of the signal received on December 5, 1958. For 13 hr. from 0701 to 2010 M.E.T. a distinct signal was seen in one or both of the two bands. Since the results are recorded in the form of a spectrogram, only the frequency variations are shown here. The cross at the centre of each sweep denotes the frequency of maximum intensity, while the length of line indicates the frequency-width of the emission above that of the background signals. For these sweeps the 'hiss' signals maxima varied from 2·3 to 3·4 kc./s. By contrast, the lower-frequency emissions do not vary more than + or − 150 c.p.s. around 750 c.p.s. The band-width of the lower-frequency emissions is less than that of the upper band, as can be seen on the spectrograms in Fig. 2. The error of reading and the band-width of the equipment lead to a value of + or − 100 c.p.s. for the accuracy of the measurements. Thus, while the lower-frequency band remained fixed in frequency the 'hiss' emissions varied. The amplitudes of each of the bands fluctuated from sweep to sweep during every disturbed period.

In all the eleven observed periods of emissions, micropulsations of the magnetic field were shown on the Kiruna magnetograms. The micropulsations seen in the auroral zone show periods of the order of 0·5–5 min. and maximum displacement of 50γ. These do not occur during the largest deflexions of the magnetic storms. In four of the longer periods of radiation detected, the low-frequency emissions occurred between two phases of a magnetic storm when micropulsations were present.

The Kiruna magnetogram for December 5 is shown in Fig. 3. A tracing of the outlines of six consecutive recordings during the December period is shown in Fig. 4. The time of duration of each tracing is about 10 min. The low-frequency tracing is not included, and therefore there is a gap of 23 min. between the recordings. The dotted line is the no-signal receiver noise line. The curvature of the zero line is due to equipment parameters. The vertical amplitude scale is logarithmic. The signals are at best of extremely low amplitude, rarely exceeding 5 μV. from the antenna.

The 'hiss' signals received have been observed before, but at lower latitudes. Watts[2] observed 'hiss' for 12 hr. at a site near Boulder, Colorado. The duration of our longest period recorded is somewhat longer than this. The presence of so many examples of this low-frequency emission during the short period of recordings indicates its prevalence in the auroral zone during periods of magnetic activity of the micropulsation types.

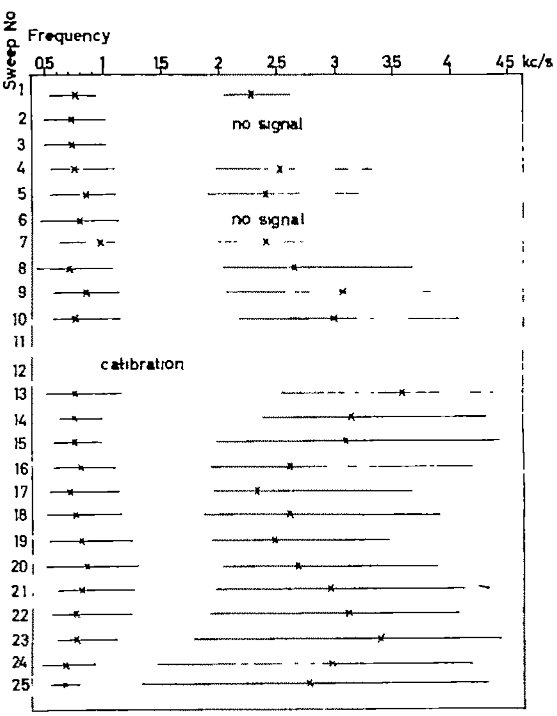

Fig. 2. A spectrogram of the signal received on December 5, 0701 to 2010 M.E.T., 1958. The length of line indicates the frequency-width. The cross on each line denotes the frequency of maximum intensity

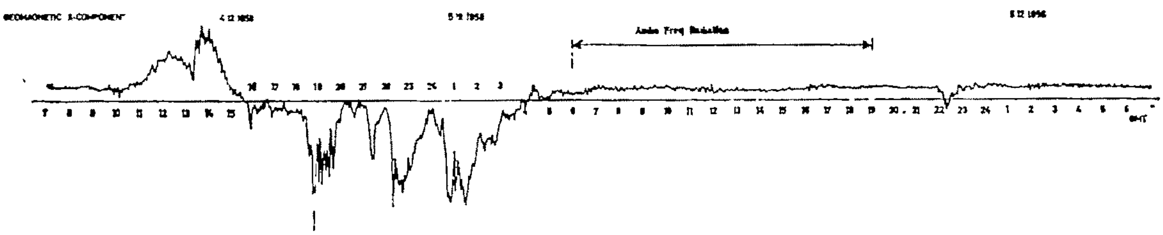

Fig. 3. The horizontal component of the geomagnetic field at Kiruna

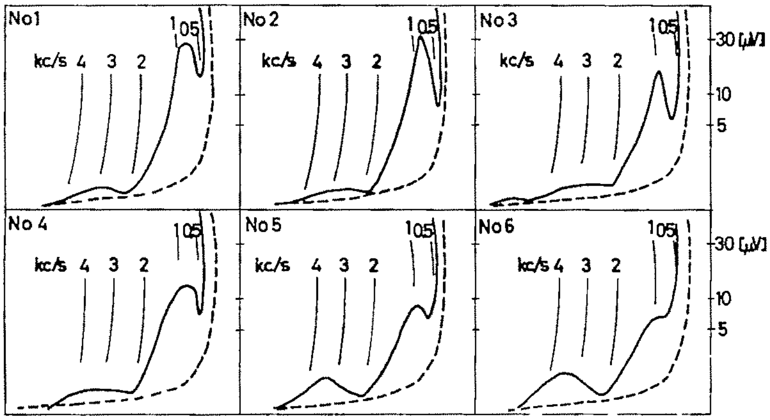

Fig. 4. Tracing of the outlines of six consecutive recordings of the December period 1958

The lower-frequency sweep has not as high a sensitivity as the higher one. The results from this channel indicate, however, that the 750 c.p.s. emission is relatively wide in spectrum. A sharply defined signal would have increased the level considerably in the lower-frequency sweep. It increased it only slightly.

The origin of low-frequency emissions has been discussed by various authors who have widely differing ideas. Ellis[3] states that Čerenkov radiation is the probable cause of 4–5 kc./s. auroral signals, Gallet[4] and Gallet and Helliwell[5] base their theory on an analogy to travelling-wave-tube amplifiers with modifications to suit the solar–terrestrial parameters and Aarons[6] compares the gas discharge mechanism with the aurora. Discussions of the possibility of detecting the protons and the other ions by the emissions is also discussed by Aarons.

One reason for being able to detect the signal is the low background-level of noise at the remote site and the low signal-level from atmospherics at Kiruna. Analysis of the three-months period (to be described in another publication) indicates that the normal diurnal variations of the atmospherics were not correlated with magnetic disturbances described in this article.

The lower-frequency emissions are of greater interest than the upper band principally because they lie for the most part near 750 c.p.s., the gyro-frequency of protons in the Kiruna area at an altitude of 100 km. Table 1 shows the gyro-frequency for protons in Kiruna as a function of altitude, calculated from the formula:

$$f_H = \frac{eH}{2\,\pi mc}$$

Fig. 2 demonstrates the stability of the lower-frequency emissions. However, on May 5, 1959, an emission band centred at 1 kc./s. was detected. In subsequent sweeps the single band began to split into two bands with the lower one slightly above 1 kc./s. and the upper band moving to 2 kc./s. Tracings of the signal are seen in Fig. 5. If the May 5 case is another example of 'hiss' developing into two bands it does not mitigate the case for proton radiation. However, it may well be that the lower-frequency band is a component of the 'hiss'. Only additional experimental evidence will determine this. The largest part of the data shows signals near 750 c.p.s. with relatively small changes in frequency.

Table 1

Altitude	Kiruna
0 km.	794 c./s.
60 km.	771 c./s.
100 km.	755 c /s.
200 km.	718 c./s.

The evidence in this article is rather clear. There are excellent correlations between the auroral zone micropulsations and the radiation in the audio-frequency band. Two distinct frequency bands have appeared on 12 per cent of the days for which results were obtained. This is a lower limit since on several days when the sensitivity was low, emissions were not detected. The upper-frequency band is 'hiss'. It varies in frequency throughout the recording period.

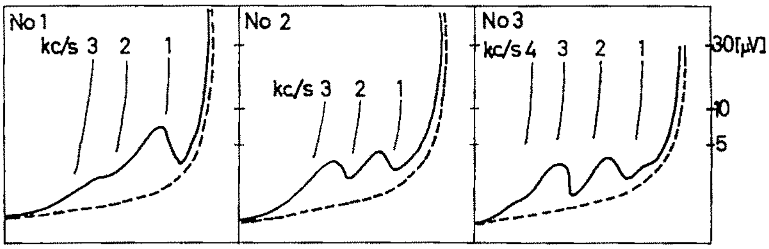

Fig. 5. Tracing of the outlines of three consecutive recordings of the May period 1959

The lower band at 750 c.p.s. for almost all the cases is steadier in frequency. Its spectral location indicates that it may well be radiation from protons, but its occasional change in frequency may make it another component of the 'hiss' signals.

We are indebted to Dr. B. Hultqvist, director of the Kiruna Geophysical Observatory, for his interest and advice.

The programme was in part supported by the U.S. Air Research and Development Command (Contract 61(514)-(1314)).

CELL-GROWTH OF PLANT ROOTS, INORGANIC SALTS AND NATIVE SERUM PROTEINS

By Dr. FOLKE RØNNIKE

Laboratory of Plant Physiology, Royal Veterinary and Agricultural College, Denmark

THIS article deals with the influence of increasing concentrations of some inorganic salts on the phytohormonal activity of native human serum compared with the influence of indolyl-3-acetic acid, which is considered the most important phytohormonally active substance in serum[1].

The phytohormonal activity of human serum, that is, its inhibitory effect on the growth of *Lupinus albus* roots, is influenced by the salt concentration in the nutrient solution with which the serum is diluted. Thus, the inhibitory effect of serum when diluted with distilled water is far less than when the serum is diluted with a plant-physiologically well-balanced triple-salt solution consisting of calcium nitrate 2·5 m*M*, magnesium sulphate 7·5 m*M*, and potassium dihydrogen phosphate 9·0 m*M* (after Shive[2])[3]. The increased effect of serum in a solution of salts, as the result of single-salt experiments, is interpreted as a phytohormone-separating effect of, especially, the calcium ions on the serum proteins[4].

The phytohormonal effect of serum is diminished, however, when the concentration of inorganic salts in a serum-salt solution is increased further, as will be accounted for below.

Fig. 1 shows the results of four, mutually independent, experiments (I, II, III and IV) with the growth of *Lupinus albus* roots in nutrient solutions, partly with and partly without admixture of native serum at the concentrations 3, 2, 2 and 1 per cent (v/v). The nutrient solutions used with or without the addition of serum comprise distilled water, Shive's solution, and solutions of the individual salts contained in Shive's solution. 1/1 × Shive thus denotes the salt solution specified above. 2/1, 3/1 and 5/1 × Shive denote salt solutions in which all the salt components are present at concentrations 2, 3 and 5 times that of 1/1 × Shive's solution. The upper curves of Fig. 1 show the growth in solutions without serum; the lower curves show the growth in solutions with serum.

The osmotic pressure in Shive's solution is about 1·3 atmospheres. Consequently, 5 × Shive has an osmotic pressure of about 6·5 atmospheres, corresponding to the osmotic pressure of undiluted human serum. It is a familiar fact that the osmotic pressure of serum proteins is extremely low: about 0·033 atmospheres.

In Fig. 1 the salt concentrations are shown on the axis of abscissæ, while the axis of ordinates shows the elongation of the roots in mm. per 24 hr. at 15° C. (the Macht–Livingston technique[5]). The salt concentration 0 in experiments I and II indicates that in these experiments distilled water has been used,

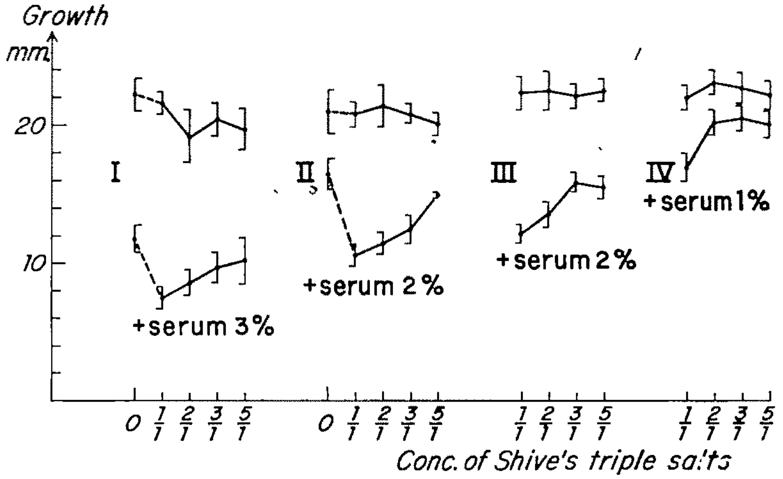

Fig. 1 Experiments I, II, III and IV. The phytohormonal effect, that is, the root-growth-inhibitory effect, of native, human serum at concentrations of 3, 2, 2 and 1 per cent (lower curves). For comparison, the upper curves show growth in the same solutions without serum, that is, in distilled water (experiments I and II only), in Shive's triple-salt solution, and in solutions with all the Shive salts multiplied by 2, 3 or 5 (experiments I to IV). Axis of ordinates: growth of roots in mm. in 24 hr. at 15° C.

partly with and partly without admixture of serum as nutrient solution.

The upper curves of Fig. 1 present the elongation in the above-named salt solutions and in distilled water without serum, respectively. It will be seen that in all solutions with serum the growth is unaffected irrespective of whether the salt concentration is one or five times the concentration in Shive's solution. In 24-hr. experiments the elongation in distilled water (the first two values on the upper curves for experiments I and II) is 0–10 per cent greater than in Shive's solutions[5,6].

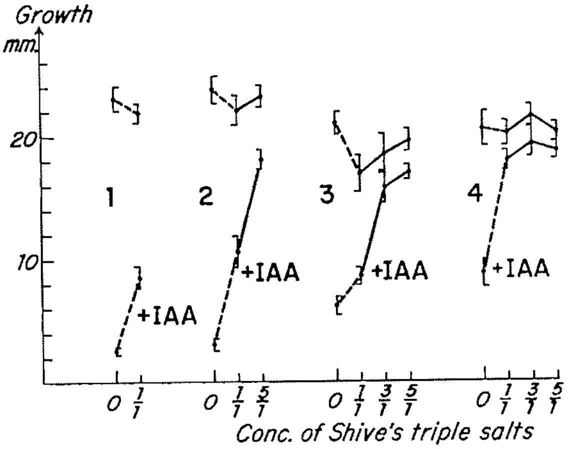

Fig. 2. Experiments 1, 2, 3 and 4. The phytohormonal effect, that is, the root-growth inhibitory effect, of indolyl-3-acetic acid (IAA) 10^{-7} *M* (lower curves). Upper curves show comparative growth in the same solutions without indole-3-acetic acid, that is, in distilled water, in Shive's triple-salt solution, and in triple-salt solutions with all the Shive salts at concentrations multiplied by 3 or 5. The concentration in Shive's solution alone is denoted by 1/1. Axis of ordinates: growth of roots in mm. in 24 hr. at 15° C.

From the first two values on the lower curves, representing the results of experiments I and II, it will be seen that in the solutions containing serum diluted with distilled water the elongation is greater than in the serum solutions diluted with Shive's salts. The growth depression brought about by the admixture of Shive's salt to the serum solution is accounted for in detail in a previous paper[4], and as mentioned, it is due to a specific serum-protein/inorganic-salt interaction.

In the solutions containing serum diluted with the various Shive salts, represented by the four lower curves in Fig. 1, which give the results of experiments I–IV, it will be seen that the elongation increases with a salt concentration increasing beyond the concentration in 1/1 × Shive. In all the experiments the elongation in the serum solutions containing Shive salts is thus lowest when the solution is diluted with 1/1 × Shive.

How, then, is this reduced phytohormonal activity of serum with increasing inorganic ion concentration to be interpreted ?

It is impossible to give an exhaustive explanation of this phenomenon ; but a partial explanation may be found by comparing the effect of increasing salt concentrations on a pure, unbound phytohormone in a corresponding experimental series and the effect just named of the same salts on the protein-bound phytohormone in human serum.

Fig. 2 serves this purpose. It shows the results of four experiments (1, 2, 3 and 4), in which indolyl-3-acetic acid is dissolved, partly in distilled water, partly in Shive's solution, and partly in solutions containing increasing concentrations of the individual Shive salts, as described previously for Fig. 1. From the upper curves for the four experiments in Fig. 2 it will be seen that, as was the case in Fig. 1, the elongation in the salt concentrations without indolyl-3-acetic acid is, in all essentials, constant with increasing salt concentration (experiment 3 of Fig. 2, however, shows a slight increase with increasing salt concentration), while, as previously, the elongation in distilled water with indolyl-3-acetic acid is greater than, or of the same order as, the elongation in the salt solutions.

From all the lower curves in Fig. 2 it will be seen that the root-growth inhibition, the phytohormonal activity, of the unbound indolyl-3-acetic acid in an aqueous solution at the concentration 10^{-7} *M* is greatly pronounced but decreases rapidly when the indolyl-3-acetic acid solution contains a certain amount of inorganic salts (with calcium ions). This effect is not known to have been described before for the root-growth experiments, and it is preponderantly due to the presence of calcium ions in the solutions[4]. For *Avena* coleoptiles, Thimann and Schneider[7] have described a similar calcium–auxin antagonism in single-salt experiments with calcium chloride. The increased auxin-induced elongation of coleoptiles was thus inhibited by the addition of calcium at concentrations above 0 001 *M*. Through experiments, likewise with *Avena*, Cooil and Bonner[8] demonstrated that this calcium effect is associated with a tightening effect upon the cell wall and is apparently brought about through interference with the normal processes involving auxin.

Like coleoptile cells, also plant root cells become apparently more resistant to action of externally applied phytohormones with increasing calcium concentrations in the nutrient solution. The effect of increasing concentrations of the Shive salts beyond the concentration in 1/1 × Shive in the serum dilutions, illustrated in Fig. 1, may therefore be interpreted as being due to such an increased resistance of the roots.

Fig. 1 thus shows two salt or calcium effects, namely : (1) a primarily acting salt or calcium effect, acting on the serum proteins[3] and becoming apparent by a comparison of the phytohormonal effect (root-growth inhibition) of serum diluted with distilled water and the phytohormonal effect of serum diluted with 1/1 × Shive's triple-salt solution ; (2) a secondarily acting salt or calcium effect, acting on the plant root cells and becoming apparent by an additional supply of Shive salts or calcium ions to the serum solution beyond the concentration in 1/1 × Shive.

MICROBIAL OXIDATION OF GLYCOLLATE VIA A DICARBOXYLIC ACID CYCLE

By Dr. H. L. KORNBERG and J. R. SADLER*

Medical Research Council Cell Metabolism Research Unit, Department of Biochemistry, University of Oxford

ALTHOUGH the tricarboxylic acid cycle[1] has been established as the major route for the oxidation of acetate, and of compounds catabolized to acetate, in micro-organisms as well as in other biological materials (for review, see Krebs[2,3], Elsden[4], Ajl[5] and Kornberg[6]), little is known of the pathways of oxidation of C_2-compounds more highly oxidized than acetate (such as glycollate, glyoxylate or glycine). Studies with mammals[7], with mammalian tissue preparations[8-10] and with a strain of *Pseudomonas*[11,12] have led to the suggestion that glycollate or glycine is oxidized via glyoxylate and formate (1):

$$\left.\begin{matrix}CH_2.OH.COOH\\ \text{or}\\ CH_2NH_2.COOH\end{matrix}\right. \xrightarrow{+O_2} CO_2 + HCOOH \xrightarrow{+\frac{1}{2}O_2} CO_2 + H_2O \qquad (1)$$

Evidence for the occurrence of this pathway in *Pseudomonas* rests largely on the demonstration that formate, which is rapidly oxidized, accumulates[11,12] when cells oxidizing glycine or glyoxylate are poisoned with hypophosphite[13].

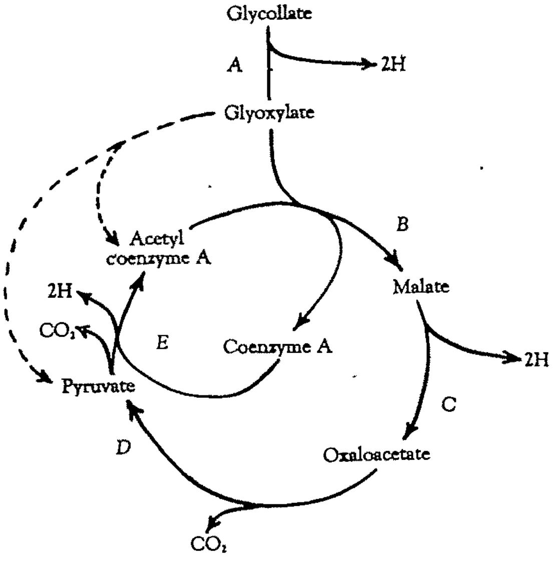

Fig. 1. Postulated dicarboxylic acid cycle for the oxidation of glycollate and glyoxylate. (The sequence of reactions is catalysed by *A*: glycollic oxidase (ref. 18), *B*. malate synthetase (ref. 19); *C*: malic dehydrogenase (ref. 20); *D*: oxaloacetic carboxylase (ref. 25) and *E*: the pyruvate oxidase system (ref 26). Each turn of the cycle results in the oxidation of one molecule of glyoxylate: $CHO.COOH + O_2 \rightarrow 2CO_2 + H_2O$. The dotted line represents the pathways from glyoxylate to cycle intermediates, first shown by studies with *Ps. ovalis* Chester (ref. 18), which also operate in the strain of *E. coli* used in the present work, and which are a means of providing for the net formation of precursors of cell constituents during growth)

However, the oxidation of glycollate and of glyoxylate by washed suspensions or cell-free extracts of *Pseudomonas aeruginosa*[14], of *Pseudomonas ovalis* Chester[15], or of *Escherichia coli* (strain *w*) proceeds at identical rates and to identical extents in the presence or absence of hypophosphite, although formate oxidation is completely abolished by this inhibitor. This indicates that a sequence of reactions (1) involving free formate is probably not of major importance in glycollate oxidation in these micro-organisms.

The observed effects on glycollate metabolism of other metabolic poisons, particularly of fluoroacetate[16,17], suggest that the metabolism of glycollate (and of glyoxylate derived therefrom) is linked to that of intermediates of the tricarboxylic acid cycle. One such link has been demonstrated[18]: extracts of glycollate-grown *Pseudomonas ovalis* Chester can catalyse the formation of intermediates of the tricarboxylic acid cycle from glycollate or glyoxylate. Acetyl coenzyme *A* can be formed by a sequence of reactions the overall effect of which is:

$$2 \text{ glyoxylate} + \text{coenzyme } A \rightarrow \text{acetyl coenzyme } A + 2CO_2 + H_2O \qquad (2)$$

and can react with glyoxylate to form malate (3), catalysed by malate synthetase[19]:

$$\text{glyoxylate} + \text{acetyl coenzyme } A + H_2O \rightarrow \text{malate} + \text{coenzyme } A \qquad (3)$$

Malate can be oxidized to oxaloacetate[20], which can condense[21] with acetyl coenzyme *A* formed in reaction (2) to yield citrate. Since citrate can be metabolized further through the tricarboxylic acid cycle, this sequence of reactions might serve not only to provide carbon skeletons for the biosynthesis of cell constituents when micro-organisms grow on C_2-compounds more highly oxidized than acetate[18,22,23], but might also serve as part of the terminal pathway of oxidation of such C_2-compounds.

This point was tested with a mutant of *Escherichia coli*[24] devoid of the citrate-forming condensing enzyme[21] and hence unable to utilize acetate and unable to form citrate and glutamate. The results obtained show that although intermediates of the tricarboxylic acid cycle are required for growth, this cycle is not an obligatory pathway for the oxidation of glycollate. Glycollate oxidation can be effected

---

[*] Pre-doctoral Fellow of the National Science Foundation, Washington, D.C.

via a dicarboxylic acid cycle (Fig. 1), which obviates the necessity for reduction of glyoxylate to the oxidation level of acetate prior to its catabolism. It brings about the oxidation of glyoxylate (derived from glycollate[18], Fig. 1*A*) by condensation with acetyl coenzyme *A* to form malate[19] (reaction 3; Fig. 1*B*); oxidation of malate to oxaloacetate[20] (Fig. 1*C*); formation of carbon dioxide and pyruvate from oxaloacetate, possibly with intermediary formation of phospho-pyruvate[25] (Fig. 1*D*) and regeneration of the acetyl coenzyme *A* acceptor molecule from pyruvate by oxidative decarboxylation with the pyruvic oxidase system[26] (Fig. 1*E*). A major difference in principle between oxidations effected by the tricarboxylic acid cycle and those effected by the postulated dicarboxylic acid cycle is that, while in each turn of the former, one molecule of acetyl coenzyme *A* is completely oxidized with the obligatory participation of a keto-acid (which is regenerated), in each turn of the latter, one molecule of keto-acid is completely oxidized with obligatory participation of acetyl coenzyme *A* (which is regenerated).

The evidence for the cycle was obtained from studies on the growth of the *E. coli* mutant *M* 22–64 [24], on oxidations effected by washed suspensions of the organism, and on enzymic reactions catalysed by extracts obtained after disintegration of the organism in a magnetostrictor oscillator. The main findings are as follows:

(1) The mutant grew readily on a medium containing glycollate (50 m*M*) plus glutamate (2 m*M*) as carbon sources, but did not grow on glycollate alone, or on acetate either in the presence or absence of glutamate. Growth on glycollate plus glutamate was stimulated both in rate and extent by the addition of acetate (2 m*M*). These results confirm[24] that glutamate, which is required for growth, cannot be synthesized by the mutant deficient in the ability to form citrate, and they support the view that the tricarboxylic acid cycle operates primarily to supply cell constituents under these conditions. Stimulation of growth by acetate indicated a point of entry into metabolic pathways of this compound other than via the condensing enzyme[21].

(2) Suspensions of washed cells oxidized glycollate plus acetate ($Qo_2 = 158$ µl. of oxygen absorbed/hr./mgm. dry wt.) more rapidly than glycollate alone ($Qo_2 = 109$), although they did not oxidize acetate alone. The addition of acetate, pyruvate or malate to cells oxidizing glycollate increased the quantities of oxygen absorbed from 45–59 to 83–93 per cent of that required for complete oxidation of glycollate. Pyruvate or malate were oxidized incompletely and the quantities of oxygen absorbed were consistent with their oxidation only to the level of acetate. The oxidation of glycollate was virtually complete in the presence of 2:4-dinitrophenol (1·3 m*M*).

(3) Washed suspensions of the mutant incorporated isotope from added [1-^{14}C] or [2-^{14}C]glycollate initially into malate, and thereafter into aspartate, alanine, phosphorylated compounds and sugars. No radioactivity was detected in glutamate, citrate or other intermediates of the tricarboxylic acid cycle.

(4) The addition of [2-^{14}C]acetate to cells oxidizing unlabelled glycollate resulted in the rapid appearance of the isotope in oxaloacetate and pyruvate. Similar results were obtained with [2-^{14}C]glycollate; labelled oxaloacetate and pyruvate accumulated in the presence of arsenite (10 m*M*).

(5) Washed suspensions of the mutant, shaken in air at 30°, did not evolve labelled carbon dioxide from [1-^{14}C] or [2-^{14}C]acetate alone, but did so rapidly if unlabelled glycollate or glyoxylate was added to the system. Malate or pyruvate was ineffective in promoting this oxidation of acetate.

(6) The rates and extent of evolution of labelled carbon dioxide from malate, labelled with carbon-14 in the carboxyl groups[27], were stimulated by the presence of glycollate or glyoxylate. This stimulation was abolished by arsenite (10 m*M*). Labelled oxaloacetate and pyruvate were formed in these reactions. Pyruvate or acetate was ineffective in stimulating release of labelled carbon dioxide.

(7) Cell-free extracts of the mutant readily catalysed the formation of malate from acetyl coenzyme *A* and glyoxylate, the activity of the malate synthetase[19] being exceptionally high and sufficient to effect the formation of 20 µmoles of malate/hr./mgm. of soluble protein under the conditions of assay[28]. Acetyl coenzyme *A* was not split by the extracts when oxaloacetate was added, confirming[24] the absence of the citrate-forming condensing enzyme.

(8) The activity of malic dehydrogenase[20] in such extracts was sufficient to catalyse the oxidation of 70 µmoles of reduced diphosphopyridine nucleotide/hr./mgm. of soluble protein when incubated with this coenzyme and oxaloacetate.

(9) The cell-free extracts catalysed the anaerobic decarboxylation of oxaloacetate, the initial rate of release of carbon dioxide (7·8 µmoles/hr./mgm. of soluble protein) being doubled by the presence of adenosine triphosphate[25].

(10) Although the activity of reduced diphosphopyridine nucleotide oxidases was too high to permit a quantitative assay to be made of the pyruvate oxidase system[26], the cell-free extracts formed at least 9·9 µmoles of reduced diphosphopyridine nucleotide/hr./mgm. of soluble protein when incubated with pyruvate, glutathione, magnesium chloride, thiamin pyrophosphate and coenzyme *A*, which showed that acetyl coenzyme *A* could be readily formed from pyruvate by the extract. The identity of the formed acyl thiolester with acetyl coenzyme *A* was established by chromatography of the acyl hydroxamates[29].

The enzymic rates described under (7)–(10) above are more than sufficient to account for the observed rates of glycollate oxidation (3–4 µmoles/hr./mgm. dry wt.). Coupled with the findings on the growth of the mutant (1) and the oxidation of unlabelled and isotopically labelled substrates (2)–(6), these results support the assumption that the sequence of reactions outlined in Fig. 1 occurs in the mutant of *Escherichia coli* studied, and that this oxidative dicarboxylic acid cycle represents a quantitatively important route for the microbial oxidation of carbon compounds at the oxidation-levels of glycollate or glyoxylate.

Full experimental details will be published elsewhere.

We are grateful to Sir Hans Krebs for his encouragement and interest, to Prof. B. D. Davis (Harvard University Medical School) for the gift of a culture of his *E. coli* mutant *M* 22–64, and to Miss Jennifer Twining for technical assistance during part of this work. This investigation was supported by the

Rockefeller Foundation and by the Office of Scientific Research of the Air Research and Development Command, U.S. Air Force, through its European Office, under Contract No. *AF*61(052)–180.

FUNCTIONAL PITUITARY TRANSPLANTS IN RATS

By Dr. P. N. MARTINOVITCH and D. PAVIĆ

Boris Kidrich Institute of Nuclear Sciences, P.O. B.522, Belgrade, Yugoslavia

IN a paper published a number of years ago[1] one of us presented evidence demonstrating that anterior pituitary transplants from infantile rats grafted into the anterior eye chamber of hypophysectomized adult males will often restore the functional activity of the testes. It is true that in these early experiments no histological study of the sella was undertaken, although only those animals from which the pituitary gland was removed as a whole, practically uninjured, were considered for further study.

More recently, fresh work by Courrier[2] and by Fry and Long[3] has been published indicating that the effect of the functional activity of pituitary grafts, not only on the testes but also on other end-organs, may be far greater than is attributed to them at the present time. Owing to the multiple dependence of the pituitary gland upon the hypothalamus, and to the role, recently revealed, that the former takes in the functional activity of the latter, the prevailing opinion to-day is that the anterior pituitary by itself is capable of very little of the functional activity by which this organ is characterized in its normal position (see refs. 4 and 5). Prompted by the work of Courrier and of Fry and Long, we have repeated our work on 38 adult male rats with strict observance of all control experiments including a large number of hypophysectomized controls, histological study of the sella, mating of the animals under experiment with normal females and in four cases enucleation of the eyes bearing the grafts (see Table 1). We have also enucleated the eyes of two normal rats weighing 100 gm., but with no effect upon the testicular tissue of the same. To the above rats another 12 animals should be added which received grafts from rats 18–22 days old and which are still alive (see Table 2).

Four to nine whole anterior pituitaries from males 13–22 days of age were grafted at different time-intervals in the anterior eye chamber and, as the necessity arose, under the kidney capsule. If the host animal responded to the first batch of grafts (usually three or four whole anterior pituitaries) no further grafts were given to it. Out of 38 grafted rats, 13 or 34 per cent either had their retracted testes returned into the scrotal sac or when freshly hypophysectomized animals were grafted, incipient involution was arrested, thereafter followed by a restoration that was close to normal.

Some of the definitive results so far obtained have been presented in Table 1. In Table 2 are collected the results for the animals that received grafts from rats 18–22 days old and are still alive. To the grafted rats that sired a normal female should be added two more animals which were killed, but belonged to a still different batch of rats. This raises the number of rats siring normal females to 11. As a matter of fact it seldom happens that, once the process of restoration of the testes becomes definitely stabilized, a grafted male fails to sire a female.

For the benefit of those who wish to go deeper into the problem of the functional activity of the pituitary grafts we should recommend the observance of the following points.

(1) *Mass of the grafted tissue.* When three whole anterior pituitaries of infantile rats are grafted into hypophysectomized hosts, the testes of the recipient animal may or may not respond to the grafted pituitary tissue. Some hosts failing to respond to the first batch of grafts will do so if a second batch is given to them. Some of the hosts that failed to react to a second batch may react if a third batch is grafted under the kidney capsule. These observations have led us to believe that there may be a threshold sensitivity on the part of the testicular tissue to the hormones manufactured by the grafted pituitary tissue. A certain percentage of the grafted rat

XIII–58/59	2	102	235	1	—	1	1	1	First grafted two months following hypophysectomy

testes showed no sign of stimulation even after three or more consecutive graftings. In these animals, however, the adrenal glands very often grew three to four times the size of the same glands in the hypophysectomized controls. We are inclined to believe that, in so far as our strain of rats is concerned, individual animals may show different threshold sensitivities to gonadotropic hormones, detectable only in situations where the hormone supply is very low.

(2) *Age of the donor of the grafts.* The most satisfactory results were obtained when the grafted tissue was taken from rats 19–22 days old. Pituitaries taken from animals 13–17 days of age gave good grafts. Such grafts stimulated the growth of the host animal very markedly, but their action on the male reproductive organs was less marked than when pituitaries of slightly older animals were transplanted into hypophysectomized hosts. This difference in functional activity between the younger and the older pituitary grafts may probably be explained by a difference in their functional capacity at transplantation in consequence of a difference in the degree of their differentiation.

Pituitaries taken from adult rats (50–60 days old) gave poor results because the grafts did not 'take' well. It is known that tissues of older animals give poorer grafts. Our experimental animals belonged to a random inbred strain, and a certain number of grafted pituitaries, both infantile and adult, underwent early degeneration. In order to avoid reactions attributable to immunity phenomena, it is highly desirable that all the experimental animals belong to a closely inbred strain.

(3) *Time of grafting following the hypophysectomy.* If grafting of the pituitary tissue immediately follows hypophysectomy a greater percentage of the grafted animals will have their reproductive activities restored. Some of the grafted rats, however, had their reproductive capacity restored when grafting of the pituitary tissue took place two months following hypophysectomy. This fact seems to show that prolonged hypophysectomized states may render the repairing action of the pituitary grafts on the reproductive organs more difficult.

(4) *Health of the grafted tissue.* If the pituitary tissue following grafting retains its original size, that is, if it is well supplied with blood, a large percentage of the grafted rats will have their testes partially or almost completely restored. Very few hosts with poor pituitary grafts will show an activation of the testes. Some of the grafted pituitaries may retain their healthy appearance for long periods, and then undergo a very slow degeneration. This process may sometimes go on for many months. Curiously enough, the deterioration of the grafts does not run parallel with a second involution of the testes.

(5) *Health of the grafted animal.* The health of the animal under experiment cannot be sufficiently emphasized. The pituitary grafts will never restore the body functions of the experimental animal to its normal state. In spite of that, some of the grafted rats could not be told apart from normal controls unless their previous life-history had been known. However, when the grafted tissue is removed from such animals they invariably return to their original hypophysectomized state. Animals with seriously affected lungs are practically worthless and should be rejected. Long experience has shown us the importance of the role taken by the operational procedures (anæsthesia, techniques of hypophysectomy and grafting, etc.) one is obliged to use in this experiment, and that the degree of precision of each of them may account for all the difference between failure and success.

A paper dealing *in extenso* with technical procedures and with the action of the pituitary grafts upon their end-organs will be published elsewhere.

PHYSICS

Enhancement of the High-Spacing Meridional Reflexions in the X-ray Photograph of Keratin impregnated with Heavy-Metal Salts

ENHANCEMENT of the reflexions corresponding to certain orders of the fundamental longitudinal periodicity of 198 A. in the X-ray diffraction photograph of keratin treated with heavy-metal salts has been reported by Fraser and Macrae[1]. They showed, for example, that mercury-treated Lincoln wool fibres gave enhanced seventh, twelfth, sixteenth and nineteenth orders, but they failed to observe any such effect in fibres treated with silver nitrate.

In connexion with parallel electron microscope work being done in this laboratory[2], we have recently performed experiments in which various keratin fibres (Lincoln wool, mohair, human hair and pig bristle) have been impregnated with mercury acetate or silver nitrate after they had been treated with thioglycollic acid to reduce the disulphide groups. With the mercury, we find considerable differences between the diffraction effects produced in the different fibres, and would add the third, fourth and sixth orders to the list of those which can sometimes be enhanced.

Our most significant observations, however, have been made on the Lincoln wool fibres containing silver, for in these we find a quite exceptional enhancement of all the orders from the third to the tenth. Assessment of the absolute intensity of the scattering is made difficult by the high absorption of the metal, which makes a considerable reduction in specimen size necessary if X-rays are to be transmitted with reasonable intensity. However, if the specimen size and exposure are adjusted so that the conventional large-angle photograph can be discerned, the intensity of the scattering at low angles (corresponding to Bragg spacings greater than 20 A.) is so great that details of the discrete reflexions tend to be obscured; when the exposure is adjusted to allow these details to be observed, the photographic film is completely blank at higher angles of scattering.

To a first approximation, therefore, we can say that the effect of the silver is to enhance the meridional reflexions for orders up to the tenth at the expense of the higher orders. This can only mean that the silver is spread out at fairly wide intervals along the fibre axis. When the polarization and Lorentz factors are taken into account, it turns out that the eighth-order reflexion is the strongest by a factor of 2·5 at least; the tenth, sixth and third orders are also strong, and the fourth, fifth, seventh and ninth are present but relatively weak. The absence of the higher orders and the very great intensity of the eighth can be interpreted to mean that the silver atoms are distributed with some regularity at intervals of approximately 25 A. along the α-helix.

Whether the silver is taken up within or on the surface of the microfibril is at present being investigated with the electron microscope, and preliminary results (Sikorski, J., unpublished work) suggest that, as occurs with osmium staining, the metal is for the most part located on and between the microfibrils rather than in them. Since the diffraction effect described is conditional upon the reduction of the disulphide groups, it is tempting to suppose that in some parts of the fibre, at least, the cystine residues occur at intervals of 25 A. along the axis; it may be relevant that a relatively strong eighth-order reflexion occurs in untreated human hair[3] and Lincoln wool[4], but only a weak one in porcupine quill[3], which has a much lower sulphur content.

We wish to acknowledge the financial support of the Wool Textile Research Council, which made this work possible.

Meridional Reflexions in the X-ray Diffraction Photographs of α-Keratin

X-RAY diffraction photographs of various keratins taken with fine-slit collimators of high resolution display a rich series of meridional reflexions[1-3]. Their spacings may conveniently be regarded as orders of a macro-period of 198 A. with very few exceptions. Astbury[4] has used the spacings and intensities of reflexions reported by Bear and others, from porcupine quill tip, to derive a one-dimensional Patterson diagram, and to explore the possibility of finding the sequence of amino-acid residues in the protein chains of the crystalline portion of the keratin. It might well be that the differences among keratins could provide useful clues in this quest, and the present intention is to direct attention to them.

Photographs were taken using copper $K\alpha$ radiation in an evacuated camera at specimen-film distances of

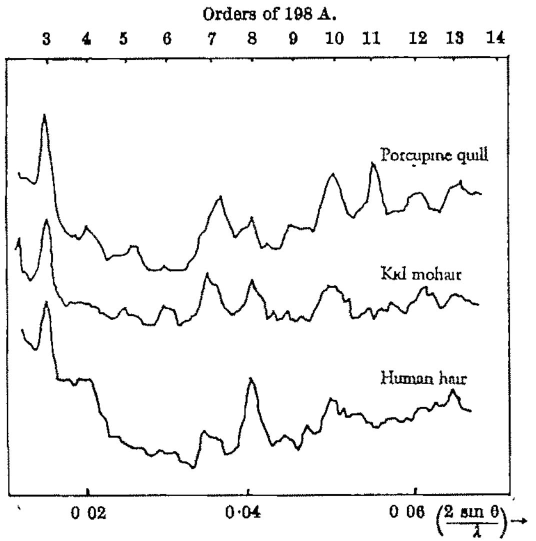

Fig. 1

24 and 20 cm. The six forms of α-keratin studied gave photographs that fall into three groups: group *A*, porcupine quill tip; group *B*, Lincoln wool and kid mohair; group *C*, human hair, horse hair and pig bristle. The intensities of the reflexions observed are reported in Table 1, using Bear's scale of intensities. In exceptional cases the spacing is given in brackets where the reflexion is displaced from the position appropriate to an order of 198 A.

It will be noted that the intensities for group *A* (porcupine quill tip) do not differ greatly from those reported by Bear and used by Astbury; the intensities for group *C* show differences in detail from those of Bear and Rugo, although the general trend is similar. The chief differences among the present groups are in orders 5, 6, 7, 8, 10, 11, 15 and 16. The intensities, similarities and differences observed by eye are confirmed by photometer traces, of which Fig. 1 shows typical examples. Further work is proceeding to investigate the possibility of extending the tentative classification used here to other varieties of keratin fibres.

Thermo-magnetic Effects in Liquids

Recently, several authors[1-7] have investigated the effect of a magnetic field on thermal convection in electrically conducting liquids. In this communication we present the results of a simple experiment on the effect of the magnetic field on the rate of cooling of two liquids, namely, mercury and water. A glass tube (length 20 cm. and diameter 4·2 cm.) was placed on a frame suspended between the pole-pieces of a large electromagnet (type *ADL* Cambridge, Mass, U.S.A.). The frame was made of wood and brass rods, and was completely isolated (thermally) from the pole pieces of the magnet. The glass tube, filled with mercury up to a height of 15·7 cm., was heated and then allowed to cool in a magnetic field of about 23,000 oersteds and without the magnetic field. The cooling curves for both cases are shown in Fig. 1. These curves clearly show that the rate of cooling for mercury is faster in the magnetic field. The experiment was later repeated also with water, and a similar effect on the rate of cooling was observed (Fig. 1).

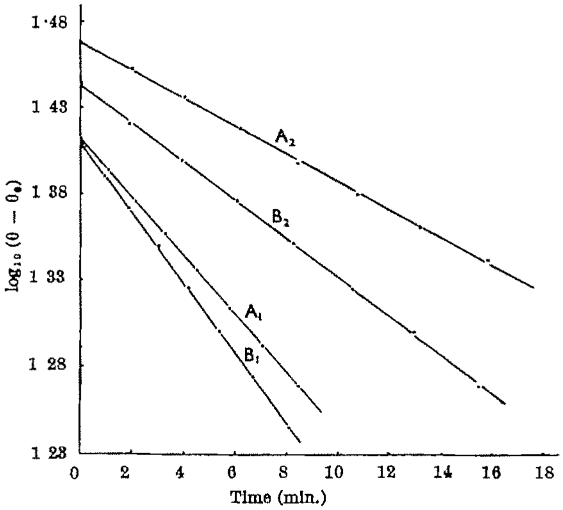

Fig. 1. Cooling curves for mercury and water with and without the magnetic field. Curves A_1 and B_1 refer to mercury, while A_2 and B_2 are for water. Curve *B* corresponds to the cooling in a magnetic field of ~23,000 oersteds and *A* refers to field free cooling. Abscissa denotes time in minutes and ordinate $\log_{10}(\theta - \theta_0)$, where θ is the instantaneous temperature of the liquid and θ_0 is that of the surroundings

In another experiment with water as the liquid, the rate of cooling was investigated in the presence of the magnetic field, which was switched off for a few minutes and later re-established. The slopes of the cooling curves obtained in the magnetic field are essentially the same, and are greater than that of the curve obtained while the magnetic field was switched off. This further supports the finding that the cooling becomes faster in the presence of a high magnetic field. Experiments were also performed to study the effect of a magnetic field on the rate of heating for both the liquids, and it was found that the rate of heating is also faster in the presence of a magnetic field. Similar results were also obtained when the glass was replaced by a copper container.

From these experiments we conclude that the rate of cooling and also the rate of heating for these liquids increases in the presence of a high magnetic field.

The above results may possibly be explained on the basis of the change in specific heat of the liquid in a magnetic field or they may be due to a change in its absorptivity (or emissivity) in the presence of a magnetic field. In the case of mercury, however, there should be some additional effect due to the inhibition of convection in the magnetic field.

The nature of the variation of the rate of cooling of liquids subjected to different magnetic fields will be the subject of future investigation.

We are grateful to Dr. K. G. Ramanathan, of the National Physical Laboratory, New Delhi, for his co-operation in allowing us to use the Laboratory's electromagnet.

CHEMISTRY

Effect of Ultrasonic Insonation on the Carbon Tetrachloride–Water–Dissolved Helium System

IT was the purpose of this study to obtain more evidence regarding the effect of ultrasonics on chemical reactions, and to determine the relationship between the reaction yield and solubility of dissolved gas in the system. Griffing[1] found that gases of different solubilities have different thresholds of cavitation; but no attempt was made to ascertain the effect of varying the solubility of a particular gas.

The system studied was the carbon tetrachloride–water–dissolved helium system. In order to ensure that the helium was the gas responsible for any reaction that might be observed, the water used was purified and degassed. Carbon tetrachloride was added and the mixture was vigorously agitated. Helium was then bubbled through, and after settling the substrate consisted of two distinct phases. The phase rich in carbon tetrachloride was used for the experiments. The carbon tetrachloride–water–dissolved helium mixture was then transferred (in a helium atmosphere) to a specially designed reaction vessel, one side of which was covered with a polyester film of high sound permeability. This served as a sound window.

The reaction mixture was exposed to 1,000 kc./s. sound energy at a power output of 7·20 watts/sq. cm. The sound was transmitted through a plain tap water medium from crystal to vessel. This water was circulated and served also as a constant-temperature bath. The distance between the crystal and reaction vessel surface was maintained the same for each run. This assured uniform sound absorbance by the sample. The samples after insonation were analysed for chlorine by addition of potassium iodide solution and the titration of the liberated iodine with sodium thiosulphate solution. Starch was used as indicator. It was found that the *p*H change brought about by the reaction was sufficient to supply the acid medium need for the above analysis.

Samples which were insonated immediately after they were transferred from the preparation apparatus to the reaction vessel gave erratic results. Samples which were transferred and allowed to stand 12 hr. before insonation gave much greater reproducibility. Griffing[1] observed a similar phenomenon. Different final concentrations of chlorine, due to insonation, were observed for vessels which were completely filled and those which were partially filled with reaction mixture (the vapour space being filled with helium). In addition to chlorine, it was thought that trace amounts of hexachloroethane could be detected.

The formation of chlorine and hexachloroethane from the reaction mixture, in the absence of oxygen, indicates a free-radical mechanism. This could well be due to the break-up of the water molecule as a result of local heating due to the adiabatic compression of the dissolved gas, as Griffing has suggested[2].

The different yields observed for partially filled and completely filled vessels can be ascribed to the variation in gas solubility with pressure. Ultrasonic insonation is a degassing process. It is obvious that the residual pressure in a vessel which was originally filled is much greater than the pressure in a vessel which was partially filled. According to Griffing's theory with regard to the effect of solubility on cavitation[1], the yield of chlorine would be greater at low pressures and lower at high pressures. The data show that the yield for filled vessels was lower than that for partially filled vessels. This supports the solubility theory of Griffing, using only a single gas. This eliminates any doubt which might have arisen due to the varying of solubility with different gases and thereby changing other physical properties as well.

The cause of the erratic results after sample transfer was probably nucleation—the formation of centres of gas bubble agglomeration. This would occur in random fashion for each run, thereby introducing a lack of similarity in sample preparation.

I would like to acknowledge the help of Dr. O. L. Updike during the course of the work, which was carried out at the University of Virginia, Charlottesville, Virginia.

Optical Rotatory Dispersion Studies on Partially Methylated Cellulose

ROTATORY dispersion studies have been conducted on a large number of proteins and polypeptides[1–3]. We wish to report some preliminary studies on the rotatory dispersion of polysaccharides. The material used for this work was 'Methocel' (registered trade mark of the Dow Chemical Company, Midland, Michigan) supplied by the Dow Chemical Co. 'Methocel' is a partially methylated cellulose which has the characteristic of being more soluble in cold water than in hot water. This investigation was carried out on material with an intrinsic viscosity of 1·6 (corresponding roughly to a molecular weight of 35,000) and a methyoxyl analysis of 29 5 per cent (1·8 OCH_3 groups/anhydroglucose unit). The method of solubilizing this particular polysaccharide consisted in dispersing the material in boiling water and allowing it to cool to room tem-

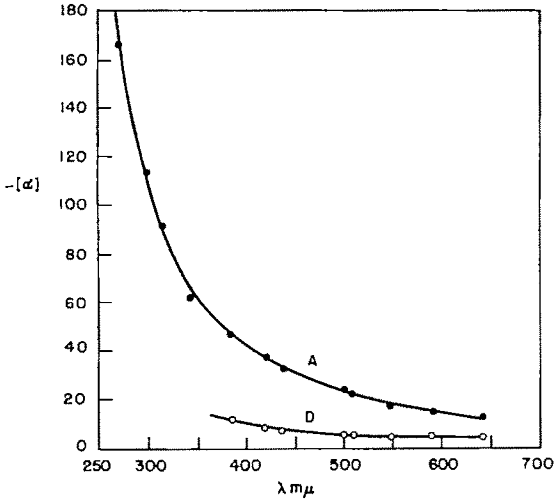

Fig. 1. Optical rotatory dispersion curves of 2 per cent aqueous solutions of methylcellulose at 24° C. See text for description of curves *A* and *D*

perature. Solution *A* (Figs. 1 and 2) was further cooled to 0° C. overnight and then maintained at room temperature (24° C.). Solution *D* (Figs. 1 and 2) was maintained at room temperature. The dispersion curves for these two solutions are shown in Fig. 1. The majority of the measurements were carried out on a Keston photoelectric polarimeter attached to the Beckman *DU* spectrophotometer. The cell was covered with black paper to eliminate any spurious rotation as described in a recent paper by Winkler and Markus[4]. The dispersion curve of solution *A* from 270 mμ to 600 mμ was obtained on a Rudolph photoelectric spectropolarimeter, model 200 *S*. (The use of this instrument was kindly permitted by Prof. M. L. Wolfrom of the Chemistry Department, Ohio State University, Columbus, Ohio.) The results using the Keston instrument checked very well with the results on the Rudolph instrument.

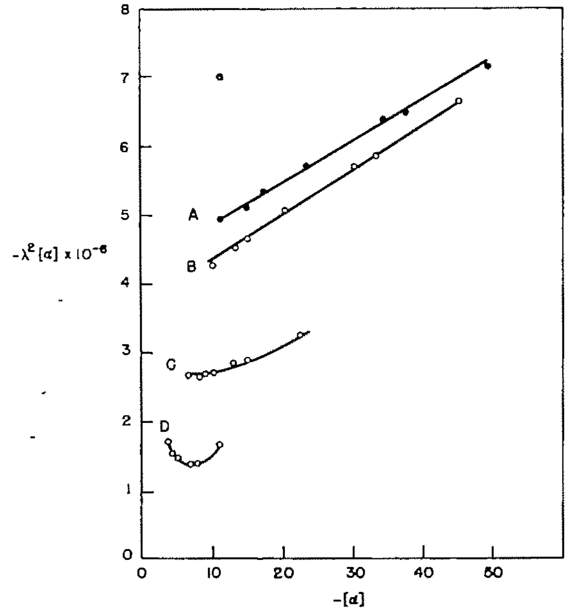

Fig. 2. Modified Drude plots of the dispersion data in Fig. 1. See text for description of curves *A*, *B*, *C* and *D*

The dispersion data were plotted by the method of Yang and Doty[2] as given in the following equation:

$$\lambda^2[\alpha] = \lambda_c^2[\alpha] + K \qquad (1)$$

(λ denotes wave-length in mμ, [α] specific rotation, λ_c the dispersion constant and *K* the intercept).

The modified Drude plots of the dispersion data are given in Fig. 2. The partially methylated cellulose solubilized at 0° follows the simple one-term Drude equation as shown by curve *A*, Fig. 2. Curve *D*, Fig. 2, is the complex dispersion of this particular polysaccharide which had been solubilized at room temperature. This solution is very unstable and progresses from curve *D* to curve *C* (1 hr. in the polarimeter tube) to curve *B* (16 hr. in the polarimeter tube). Curve *B* represents an equilibrium state. This equilibrium solution may be shaken and the original curve *D* is returned. This anomalous dispersion can be explained on the basis of molecular association causing an aggregate which slowly settles out of solution leaving the randomly dispersed material behind. By analogy with the polypeptide studies of Yang and Doty[2] the linear Drude plots (curves *A* and *B*, Fig. 2) represent partially methylated cellulose randomly dispersed in solution.

These studies will be further amplified in a detailed publication on this phenomenon.

Deuterium–Hydrogen Exchange between Water and Macromolecules: Accessibility of Cellulose

Although many workers have observed the exchange reaction of heavy water with macromolecules indirectly by the change in composition of the water[1,2], and by infra-red measurements[3-5], only one group has reported the measurement of the exchange directly by the change in weight of the macromolecules. Burley, Nicholls and Speakman[6] measured the increase in weight when wool keratin reacted with the vapour of heavy water. They used a quartz spring balance with a small sample (about 0·1 gm.). In the present work, in which the gravimetric method was also employed, a much larger sample (about 6 gm.) was used. The sample was placed in a glass cell similar to one used in the measurement of adsorption isotherms of water on fibrous macromolecules[7].

The principal problem in the gravimetric method is to achieve complete dryness. Recently, the conditions necessary for obtaining this dryness were determined unequivocally by Lang and Mason[8] for cellulose and by Hvidt and Linderstrøm-Lang[9] for insulin. Complete drying was obtained in the present work by a combination of diffusion and rotary vacuum pumps and 'dry ice'-acetone baths. The celluloses (cotton and cotton mercerized in 18 per cent sodium hydroxide) were evacuated for a minimum of 72 hr. at 70° C., although there was usually no change in weight after 24 hr.

Table 1

Cellulose	Weight increase of deuteration (per cent)	Heat of wetting (refs. 7 and 9) (cal / gm.)	Monolayer values (refs. 7 and 9) (gm. water/100 gm.)		Accessibility (ref. 10)
			Brunauer–Emmett–Teller	Harkins–Jura	
Cotton	0·710	12·33	3·19	3·29	0·38
Mercerized cotton	1·21	20·25	5·21	5·36	0·65
Ratio, M/C	1·71	1·64	1·63	1·63	

Deuterium loading was obtained by keeping the celluloses in contact with heavy-water vapour (99·7 per cent) for several hours, and then evacuating to constant weight. After four to six loadings, there was no further increase in the evacuated dried weights. The process was completely reversed by ordinary water vapour, so that there were no 'resistant' deuteroxyl groups produced[3]. The percentage gains in weight along with other results for the same substances[7,9] are given in Table 1.

Included in Table 1 are the accessibilities of the two celluloses. The accessibility is defined[10] as the ratio of the number of hydroxyl hydrogens exchanged to the total number in the cellulose. The accessibility of cotton cellulose to the vapour of heavy water is exactly the same as that calculated by Valentine[11] for the amorphous fraction. Valentine based his calculations on correlations between infra-red measurements of celluloses deuterated with heavy-water vapour[3] and water vapour adsorption isotherms[10]. The present accessibility of cotton cellulose is also similar to that for bacterial cellulose[3].

The ratio of the Brunauer–Emmett–Teller monolayer molar values[7,9] to the moles of deuterated hydroxyls are 0·25 and 0·24 for cotton and mercerized cotton respectively. This suggests that each accessible glucose anhydride unit adsorbs about one molecule of water in the complete monolayer.

Of the three hydroxyls in the glucose unit, two are on the ring and one is on the side-chain. The tentative deduction that a maximum of one molecule is adsorbed directly on each accessible glucose unit suggests in turn that the side-chain hydroxyls may be the sites of hydrogen bonding[7], and that they may be exchanged more rapidly than the ring hydroxyls. Kinetic experiments in progress appear to support the latter hypothesis.

This work was reported at the annual conference of the Chemical Institute of Canada, May 25–27, 1959, Halifax, N.S.

A Proposal for the Nomenclature of Free Radicals

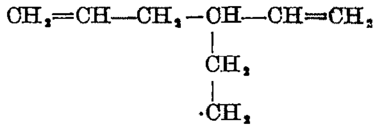
IN the course of preparation of a number of organic free radicals for mass spectrometric and electron spin resonance studies, it has become apparent that the system of nomenclature for organic compounds approved by the International Union of Chemistry[1] does not, in many cases, serve to identify a free radical unambiguously. As an example, there are listed below the possible butenyl radicals, the dot indicating the nominal position of the free electron. (This is not to imply that the electron is actually localized at this site.)

(1)	$CH_3CH=CH\dot{C}H_2$	2-butenyl
(2)	$CH_3CH=\dot{C}CH_3$	
(3)	$CH_2=CHCH_2\dot{C}H_2$	1-butenyl
(4)	$CH_2=CH\dot{C}HCH_3$	
(5)	$CH_2=\dot{C}CH_2CH_3$	
(6)	$CH=CHCH_2CH_3$	
(7)	$CH_2=C(CH_3)\dot{C}H_2$	2-methyl propenyl
(8)	$\dot{C}H=C(CH_3)CH_3$	

The difficulty does not arise with derivatives of the radicals; for example, the chloride of (4) is 3-chloro 1-butene, and that of (8) is 1-chloro 2-methyl propene. When, however, the corresponding 'free' radicals are considered the system fails for lack of a functional group name for the free electron. We propose that the ending 'yl' be retained for the free radical and that the free electron be given the functional group name of 'el', preceded by a number to indicate its position as for any other substituent. Thus the free radical (4) becomes 1-butenyl 3-el as distinguished from (5) 1-butenyl 2-el.

The naming of di-radicals would follow the usual practice for double bonds; for example, $\dot{C}H_2-CH=\dot{C}H$ would be called propenyl 1,3 di-el and $\dot{C}H=C=\dot{C}H$ propadienyl 1,3 di-el.

A free radical in which the free electron is located on a side-chain, such as the (hypothetical) radical



$$CH_2=CH-CH_2-\underset{\underset{\cdot CH_2}{|}}{\underset{CH_2}{\underset{|}{C}H}}-CH=CH_2$$

would be named in this system (4 ethyl 2-el) 1,5 hexadiene.

At present radicals such as (1), (4) and (7) can be named as derivatives of allyl; (1) is γ-methylallyl, (4) is α-methylallyl and (7) is β-methylallyl. These names, although useful in indicating the relation of these radicals to each other as derivatives of allyl by methyl substitution, may cause confusion since derivatives of the butenes are sometimes named from their relation to α-butylene and β-butylene, in which the prefix refers to the position of the double bond rather than that of substitution.

BIOCHEMISTRY

Enzymatic Cycle of Inorganic Nitrogen in Animal Tissues

It has previously been demonstrated that oximino compounds are widely distributed in organisms[1], and that two enzymes, named oximase[2] and transoximase[3], which participate in oxime metabolism, exist in some animals. In pursuing the behaviour of hydroxylamine in living cells, we have now established that there is an enzymatic cycle between ammonia and nitrate.

An example of the procedure of preparing the enzyme solution was as follows: 30 gm. of hen liver were homogenized with 90 ml. of 0·1 M phosphate buffer of pH 7·5, and after 30 min. at 35° C., the homogenate was centrifuged at 3,000 r.p.m. for 10 min. at 0° C. The supernatant was treated with acetone at −10° C., and the precipitate which was produced at 33–55 per cent concentration of acetone was gathered by centrifuging at 4,000 r.p.m. for 7 min. 1 gm. of this precipitate was dissolved in 20 ml. of water, dialysed against running water for 3 hr. and centrifuged at 3,000 r.p.m. for 7 min. The supernatant was used as enzyme solution; it contains about 0·2 mgm. protein nitrogen in 1 ml. As the enzyme is labile, the solution must be prepared daily from fresh liver.

To measure the reducing action of enzyme preparation, 1 ml. of 0·001 M substrate was mixed with 1 ml. of enzyme solution, 1 ml of 0·013 per cent reduced diphosphopyridine nucleotide solution, 0·5 ml. of 0·005 per cent flavin adenine dinucleotide solution and 0·5 ml. of 0·1 M phosphate buffer of pH 7·5. A mixture containing no substrate served as control. The reaction temperature was 30° C. and the time 20 min. The enzymatic activity was determined spectrophotometrically and expressed in decrease (−) of absorption (−log T) at 340 mμ. Some of the results obtained are given in Table 1.

Nitrate, nitrite, hyponitrite and hydroxylamine are thus reduced by an enzyme system from hen liver. It was further found that the enzymes manifest the highest activity at pH 7·7 and 30° C., and that they are completely destroyed by heating at 50° C. for 5 min. Reduced triphosphopyridine nucleotide and flavin mononucleotide do not act as coenzymes for the reduction by liver enzymes.

Recently, hyponitrite reductase was demonstrated in *Neurospora* by Medina and Nicholas[4], and hydroxylamine reductase was extracted from a halotolerant *Micrococcus* by Taniguchi, Sato and Egami[5] as well as from *Neurospora* by Zucker and Nason[6]. It remains to be seen whether the enzyme system of hen liver contains the same reductases as those found in microbes.

For estimating the dehydrogenating action of liver enzyme system, the freshly prepared enzyme solution was heated beforehand at 40° C. for 5 min., because the reductases are more easily inactivated by heating than the dehydrogenases. The reaction mixture consisted of 1 ml. of 0·001 M substrate, 1 ml. of enzyme solution, 1 ml. of 0·013 per cent diphosphopyridine nucleotide solution and 1 ml. of 0·05 M *tris*-buffer of pH 7·5. The control contained no substrate. The increase (+) of −log T at 340 mμ was determined after a 20 min. incubation at 30° C. Some of the results are given in Table 2.

Table 1 Reducing Action of Liver Enzyme System

Substrate:	$NaNO_3$	$NaNO_2$	$Na_2N_2O_2$	NH_2OH	$(NH_4)_2SO_4$	Without substrate
−log T	−0·105	−0·148	−0·124	−0·122	−0·024	−0·022

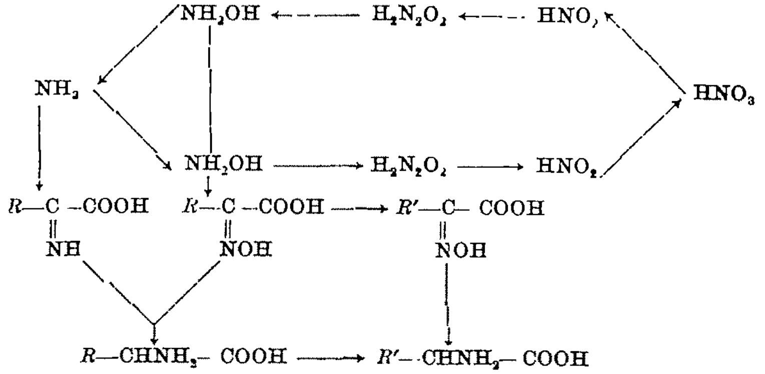
Table 2. Dehydrogenating Action of Liver Enzyme System

Substrate:	$(NH_4)_2SO_4$	NH_2OH	$Na_2N_2O_2$	$NaNO_2$	$NaNO_3$	Without substrate
−log T	+0·120	+0·095	+0·138	+0·084	+0·021	+0·015

Ammonia, hydroxylamine, hyponitrite and nitrite are thus dehydrogenated by the liver enzyme preparation. The dehydrogenation, however, does not proceed in a mixture containing phosphate buffer. It was further observed that the enzymes display the highest activity at pH 7·3–7·5 and 30° C., and that they are destroyed by heating at 60° C. for 5 min. Triphosphopyridine nucleotide, flavin adenine dinucleotide and flavin mononucleotide show no coenzymatic action for the dehydrogenation.

Klausmeier and Bard[7] reported recently that an ammonium dehydrogenase is present in *Bacillus subtilis*. However, both tri- and di-phosphopyridine nucleotide act as coenzymes for the bacterial dehydrogenase and ammonium sulphate does not serve as its substrate.

The enzyme solution was also prepared from silkworms, and its reducing and dehydrogenating actions were studied in the same way. Similar results were obtained.



Scheme 1. Inorganic nitrogen cycle and amino-acid formation

The combination of inorganic nitrogen cycle and amino-acid formation, including the transoximase–oximase reaction, can thus be formulated as in Scheme 1.

Cysteine-S-sulphonate as an Intermediate in Microbial Synthesis of Cysteine

THE synthesis of cysteine in micro-organisms from inorganic sulphur sources has been studied for some time, and the available evidence suggests that sulphate sulphur is reduced to the thiosulphate or sulphide state prior to its introduction into the carbon chain of cysteine[1-3], although some investigators have postulated that the formation of sulphur–carbon linkage occurs at the sulphite stage[4]. Working with mutant strains of *Aspergillus nidulans*, Hockenhull[2] suggested that thiosulphate is the form in which sulphate sulphur combines with the carbon skeleton. Based on the observations that cysteine-S-sulphonate supported good growth of all the thiosulphate-requiring mutants tested and that growth of these strains on thiosulphate was enhanced by the addition of serine, he concluded that thiosulphate first reacts with serine to form cysteine-S-sulphonate as an intermediate and cysteine is formed from the latter by hydrolysis. The same possibility was also postulated by Shepherd[4], although the involvement of thiosulphate in the main route of sulphate assimilation was denied by this investigator. Schlossmann and Lynen[5], on the other hand, reported the occurrence in yeast of a pyridoxal phosphate-dependent enzyme catalysing the condensation of hydrogen sulphide with serine to form cysteine. The present communication describes more convincing evidence in favour of the cysteine-S-sulphonate pathway in *A. nidulans*.

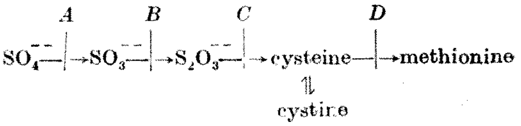
Table 1. GROWTH OF MUTANTS ON VARIOUS SULPHUR SOURCES

Group	No. of mutants	Sulphur source added					
		Na_2SO_4	Na_2SO_3*	$Na_2S_2O_3$*	Cysteine*	Cystine	Methionine
Wild type	—	+	+	+	+	+	+
A	1	—	+	+	+	+	+
B	1	—	—	+	+	+	+
C	6	—	—	—	+	+	+
D	6	—	—	—	—	—	+

+, Growth ; —, no growth (after seven days). The basal medium was supplemented with 100 μgm. per ml. of sulphur compound. All amino-acids used were L-isomers. Incubated at 32° C.

* Sterilized by Seitz filtration.

Mutant strains of *A. nidulans* (I.F.O. Collection No. 5713) requiring methionine for growth were isolated by Fries's filtration technique[6] from conidiospore suspensions exposed to ultra-violet irradiation, and 14 stable mutants were obtained from about 700 isolates. The responses of these strains as well as that of the parent wild-type strain are summarized in Table 1. The basal sulphur-deficient medium used in these experiments contained per litre 30 gm. glucose, 3 gm. sodium nitrate, 1 gm. dipotassium hydrogen phosphate, 0·5 gm. potassium dihydrogen phosphate, 0·2 gm. magnesium chloride, 1 ml. of trace element solution, and 17 gm. of agar (*p*H 6·4). (The trace element solution contained in mgm. per litre: $FeCl_3.6H_2O$, 1,000; $CuCl_2.2H_2O$, 300; $MnCl_2.4H_2O$, 72; $(NH_4)_6Mo_7O_{24}.4H_2O$, 40; $ZnCl_2$, 4,200.) All the growth tests were carried out at least twice. The results obtained indicate that the mutants can be classified into four groups, namely, *A*, *B*, *C* and *D*, according to their nutritional requirements. It appears that the simplest explanation for these findings as well as those reported in previous work[2,3] may be provided by the following scheme of sulphate assimilation:



$$SO_4^{--}\overset{A}{\vert}\rightarrow SO_3^{--}\overset{B}{\vert}\rightarrow S_2O_3^{--}\overset{C}{\vert}\rightarrow \underset{\text{cystine}}{\underset{\upharpoonleft\downharpoonright}{\text{cysteine}}}\overset{D}{\vert}\rightarrow \text{methionine}$$

where the site of block in each group of mutants is indicated by *A*, *B*, etc.

Having assumed the correctness of this pathway, the mechanism of the incorporation of thiosulphate into cysteine was then studied using the 6 strains belonging to the *C* group in which this very reaction is genetically blocked. If this step of assimilation actually involves cysteine-S-sulphonate as an intermediate, it is expected that this step is controlled by at least two genes. This possibility was examined by subjecting the 6 strains to the heterokaryosis test on the basal sulphur-deficient medium supplemented with 200 μgm. of sodium sulphate and 5 μgm. of L-cystine (for heterokaryosis see ref. 7). It was thus found and confirmed by repeated experiments that one strain (designated as 793) can form heterokaryons with any of the other 5 strains (designated as 562, 611, 649, 721 and 831). No signs of heterokaryosis could, however, be detected in any pair of the latter 5 strains, indicating their genetical identity.

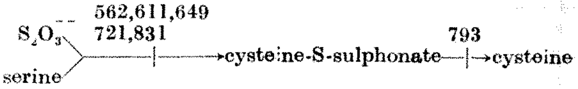
Table 2. UTILIZATION OF CYSTEINE-S-SULPHONATE BY MUTANTS OF THE *C* GROUP

Strain	Wild type	793	562	611	649	721	831
Growth (mgm. dry wt./15 ml.)	57·8	3·0	49·5	37·3	19·0*	39·3	40·8

Average of four experiments. The basal liquid medium was supplemented with 100 μgm. of Seitz-sterilized sodium cysteine-S-sulphonate per ml. Incubated at 33° C. for ten days without shaking.

* This strain showed rather poor growth even in a methionine medium.

Since strain 793 was thus genetically differentiated from the other 5 strains of the *C* group, it seemed of considerable interest to study the ability of these mutants to utilize cysteine-S-sulphonate for growth. The growth experiments were therefore conducted in a liquid medium containing 100 μgm. of sodium cysteine-S-sulphonate (prepared by a modification of the method of Kolthoff and Stricks[8]) per ml. as the sole source of sulphur. The *p*H of the medium was raised to 7·5 to minimize the spontaneous decomposition of the sulphur compound. As can be seen from Table 2, it was clearly shown that strain 793 is quite unable to grow in this medium, whereas the same medium can support good growth of the other 5 strains as well as the wild-type strain. These results, together with those of Table 1, strongly suggest that strain 793 has a genetical block between cysteine-S-sulphonate and cysteine and the other 5 strains are deficient in the enzyme responsible for the condensation of thiosulphate with serine (or other 3-carbon compounds) to form the sulphonate. This situation will be understandable from the following scheme:



$$\left.\begin{matrix}S_2O_3^{--}\\ \text{serine}\end{matrix}\right\rangle\overset{562,611,649}{\overset{721,831}{\vert}}\longrightarrow \text{cysteine-S-sulphonate}\overset{793}{\vert}\rightarrow \text{cysteine}$$

From the evidence reported in this communication, it seems very likely that cysteine-S-sulphonate is involved in the normal pathway of cysteine biosynthesis in *A. nidulans*. The occurrence of this pathway receives further support from the finding that the sulphonate can be detected polarographically in a reaction mixture containing a cell-free yeast extract, thiosulphate, serine and pyridoxal phosphate[9].

We wish to thank Mr. S. Baek for the synthesis of sodium cysteine-S-sulphonate.

Shape of the Precipitate in Immunoelectrophoresis

IN immunoelectrophoresis, according to Grabar and Williams[1], diffusion of the electrophoretically separated antigens towards the immune serum added in longitudinal basins parallel to the migration axis after the electrophoretic separation will result in the formation of precipitates in the gel, occupying varying positions between antigen and antibody diffusion centres as well as varying electrophoretic positions.

These precipitates generally appear as curved lines with their convexity towards the antibody diffusion centre, because of the immune serum diffusing in a straight line in a direction perpendicular to the electrophoretic axis, while the antigens diffuse from roughly circular diffusion centres in the agar. The point of the precipitate which is nearest to the antibody basin, the peak of the precipitate, is taken to indicate the average electrophoretic position of the electrophoretically separated component giving rise to this precipitate[2].

In some instances, precipitates are found which deviate from the half-moon-shaped symmetrical precipitates by presenting varying degrees of curvature or possessing different degrees of asymmetry. Also, precipitates may be found which have more than one peak. It has been found that these different shapes of the precipitates are remarkably constant for the same precipitating component, when sera from normal individuals are investigated under standard experimental conditions[3,4].

Grabar[5] demonstrated that the γ-globulin precipitate in normal human sera, which incidentally appears as an extended line rather than a curved half-moon-shaped precipitate, consisted of a "family of proteins", each molecule population with its own specific electrophoretic mobility although serologically identical.

In certain human sera, an extended precipitate is obtained in the α_2-globulin region, which therefore according to Grabar's findings might indicate the presence of two or more molecule populations being serologically identical, although presenting differences in electrophoretic mobilities. Also, at least two molecule populations with discrete electrophoretic positions are present, as indicated, by obtaining a precipitate with two peaks if the separation is prolonged[6].

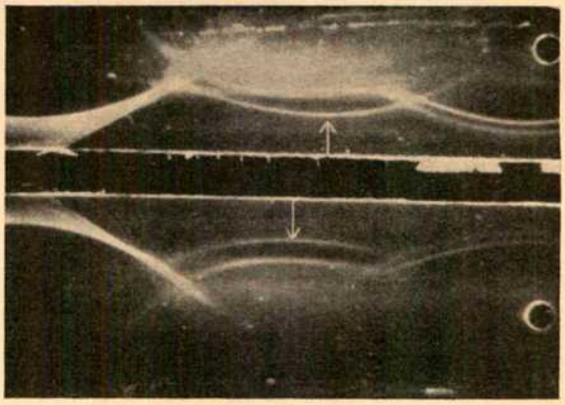

Fig. 1. Immunoelectrophoresis of mixture of sera belonging to *G.c.*1 : 0·1 ml. and *G.c.*2 : 0·4 ml. (upper basin) and mixture of the same sera in equal amounts (lower basin). To the far left the albumin-precipitate is shown and to the right the starting point and the transferrin-precipitate. The group-specific components are indicated by arrows

In other normal human sera either the fast-moving molecule population or the slowly moving molecule population is present. Mixture of sera containing the fast-moving and slowly moving precipitating components in equal amounts will result in the immunoelectrophoretic appearance of a precipitate which is extended or presents two peaks, depending on the separation time and which is indistinguishable from the same precipitate found in certain other normal sera[6]. Also, evidence for the genetic inheritance of these group-specific components has been found[7].

If sera belonging to the fast type (*G.c.*1) and the slow type (*G.c.*2) are mixed in unequal amounts, for example, in the proportions of 1 : 4, an asymmetric precipitate will occur where the peak of the precipitate is displaced from the midpoint towards the cathode (Fig. 1). In a similar way an asymmetric precipitate with its peak displaced towards the anode will be obtained if the fast-moving precipitating component is quantitatively predominant in the mixture.

This seems to demonstrate that the electrophoretic positions of the precipitates can be changed by quantitative factors. This change of electrophoretic position is even more pronounced if sera belonging to different groups are mixed in the proportions 1 : 10. If the slowly moving precipitating compon-

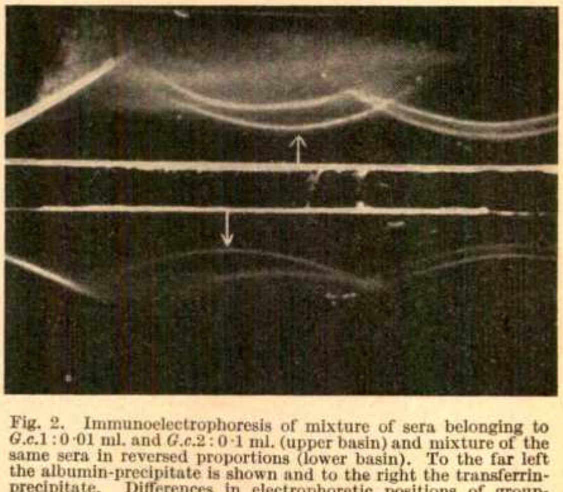

Fig. 2. Immunoelectrophoresis of mixture of sera belonging to *G.c.*1 : 0·01 ml. and *G.c.*2 : 0·1 ml. (upper basin) and mixture of the same sera in reversed proportions (lower basin). To the far left the albumin-precipitate is shown and to the right the transferrin-precipitate. Differences in electrophoretic positions of group-specific components are indicated by arrows

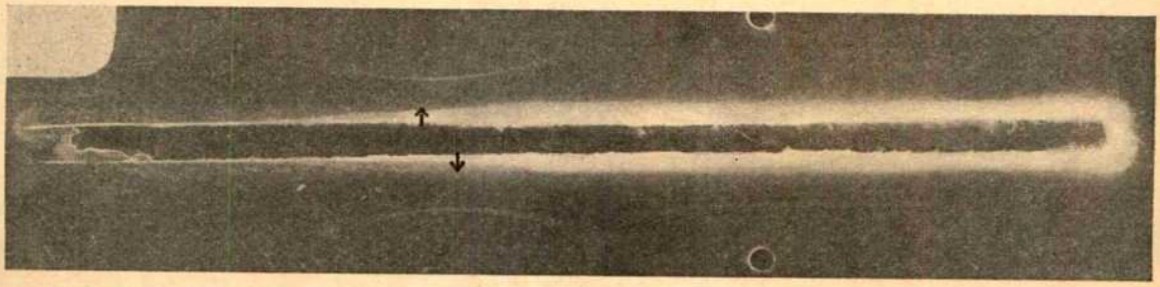

Fig. 3. Immunoelectrophoresis of mixture of sera belonging to *Hp* 1–1 and 2–2 in the same amounts (upper basin) as compared to haptoglobin-precipitate of a serum belonging to *Hp* 2–1 (lower basin). By means of an absorption technique only the haptoglobin-precipitates appear in the α_2-globulin region

ent is quantitatively predominant in the mixture, immunoelectrophoresis will demonstrate a precipitating component occupying an electrophoretic position more towards the cathode than if the fast-moving precipitating component is quantitatively predominant in the mixture (Fig. 2). None the less, the differences are not as pronounced as when the precipitates of unmixed sera belonging to these two different groups are compared.

With the haptoglobins, results of a similar nature have been obtained. These proteins have been demonstrated to present a considerable degree of 'microheterogeneity' in starch-gel electrophoresis. Three main groups can, however, be readily differentiated in starch-gel electrophoresis[8], agar-gel electrophoresis[9] and immunoelectrophoresis[6] although immunologically identical[10]. Mixture of sera belonging to *Hp* 1–1 and 2–2 in equal amounts resulted in a single line in immunoelectrophoresis, not occupying the same electrophoretic position, however, as the normally occurring heterozygote *Hp* 2–1, but being more displaced towards the anode (Fig. 3). If the mixtures consist of unequal amounts of these homozygotic haptoglobin groups, varying degrees of asymmetry and displacement of the precipitates will be observed (Fig. 4).

Therefore, it seems as if the shape of the precipitates might serve as a valuable method of characterization of certain precipitating components and also that information will be obtained as to degree of 'microheterogeneity' of proteins, being at least from the serological point of view characterized as homogeneous and where also proof of heterogeneity is not obtained by conventional electrophoretic methods. Also, the electrophoretic position of precipitates might be regarded as a reflexion of the average distribution of serologically identical molecule populations in the electrophoretic field, whereas the shape of the precipitates might indicate the quantitative distribution or scatter of molecule populations in the electrophoretic field from a serological point of view.

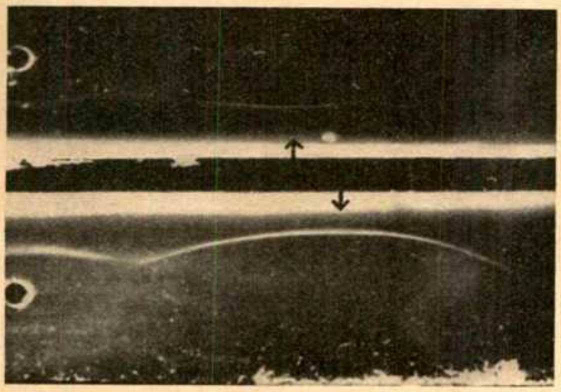

Fig. 4. Immunoelectrophoresis of mixture of *Hp* 1–1 : 0·4 ml., and *Hp* 2–2 : 0·1 ml. (upper basin) and in reversed proportions (lower basin). By means of absorption, only the haptoglobin-precipitates are visible in the α_2-globulin region

However, also other factors might affect the shape of the precipitate, for example, tailing phenomena and ratio of molecular weights between the reactants participating in the precipitate formation[11]. Finally, it must be pointed out that a serological identity-reaction might result between components which are not identical when other immune sera are used to develop the precipitates. This has been observed for some precipitating components in human sera and it seems as if different immune sera might be able to show varying degrees of reactivity with different antigenic components. In these instances an extended precipitate might be expected to show a resolution into two or more normally arc-shaped precipitates with suitable immune sera[12]. In the above-quoted examples, however, no evidence has as yet been obtained for serological differences within the haptoglobins or the other group-specific system although investigated against about 40 different immune sera prepared on rabbits and one prepared on horse.

An Anthocyanin-decolorizing System in Sour Cherries

THE anthocyanins of many fruits contribute to their attractiveness and appeal. In the course of a general study of the anthocyanins we have measured the accumulation of anthocyanins together with the activity of an anthocyanin-decolorizing system in Montmorency and English Morello sour cherries[1]. Anthocyanin-decolorizing systems have previously

Table 1. ANTHOCYANIN-DECOLORIZING ABILITY AND ANTHOCYANIN ACCUMULATION IN MATURING SOUR CHERRIES

* Calculated as the *O.D.* of extract from 1 gm. dry weight of cherries dissolved in 1 ml. of solution.

been reported in leaves[2-4] and these, in common with the system found in cherries, apparently involve the action of an oxidizing enzyme.

The activity of the anthocyanin-decolorizing system was assayed as described by Wagenknecht *et al.*[5] using cyanidin-3-rhamnoglucoside[6] as the substrate. The enzyme was supplied as 0·5 ml. of a homogenate containing 20 per cent wet weight of pitted cherries. The results are expressed as units per gm. dry weight of cherry tissue. Anthocyanin accumulation in the cherries was measured by heating pitted cherries in McIlvaine buffer[7], *p*H 3·4, to 71·1° C., homogenizing in a blendor, filtering and diluting the extract with buffer as needed for measurement of absorption at 510 mμ. Results were converted to optical density per ml. of extract per gm. dry weight. Cherries were harvested from late May until the middle of August.

The ability of homogenates of Montmorency and English Morello cherries to catalyse the decolorization of cyanidin-3-rhamnoglucoside increased rapidly with the age of the cherries up to a period of maximal activity and then decreased as the cherries became more mature (Table 1). The peak activity of the Montmorency sour cherries occurred about a month earlier than that found with the slower maturing English Morello variety. With both varieties the highest anthocyanin-decolorizing ability was detected when the cherries had accumulated relatively little red pigment.

The accumulation of anthocyanin (Table 1) continued throughout the experimental period in the case of the English Morello cherry, but accumulation of pigment in the Montmorency cherry reached a maximum several weeks before the experiment was ended.

In order to obtain maximum decolorization by the cherry homogenates it is necessary to add catechol to the reaction mixture[5]. In the course of the investigation reported here it was found that this was true throughout the sampling period. There was a difference between cherry varieties with regard to the amount of activity retained when catechol was not included in the reaction mixture. Upon the omission of catechol English Morello homogenates retained 33 per cent of their decolorizing activity while Montmorency homogenates retained only 20 per cent of their activity found when catechol was included. This may be due to the two varieties having different amounts of substances, such as polyphenols, which might play a part similar to that of catechol in promoting the decolorization of anthocyanin.

Relatively greater anthocyanin-decolorizing ability was found in those tissues which accumulated the greatest amount of anthocyanin. For example, the more heavily pigmented English Morello cherries were more active than the Montmorency cherries. In both varieties the activity of the skins was greater than that of the less highly pigmented flesh. It is not yet known if this relationship has any significance with respect to anthocyanin synthesis.

Polysaccharide Composition of Leaves

PLUM leaves (*Prunus domestica*) contain sufficient amounts of starch, cellulose, hemicellulose, and pectic substances to recommend them for studies of the biosynthesis and possible inter-relationships of these leaf polysaccharides and their monosaccharide precursors[1]. Experiments involving photosynthesis by plum leaves in carbon dioxide labelled with carbon-14 and subsequent fractionation of the leaf polysaccharides revealed marked differences, both in the extent to which carbon-14 was incorporated into the different monosaccharides of each fraction, and also in the specific activities of each monosaccharide from different fractions[2,3]. Further investigations could be facilitated by using leaves relatively richer than plum leaves in any one polysaccharide constituent. There is little information on this point, consequently a diversity of leaves has been examined for polysaccharides (Table 1).

The leaves of wheat and gooseberry were picked in July, those of all other species were gathered during the afternoons in August and early September, and immediately immersed in ethanol. After exhaustive extraction with methanol, the leaf residues were hydrolysed (*N* sulphuric acid at 100° for 16 hr.) and, after neutralization (barium carbonate), the products examined on paper chromatograms in two solvent systems (ethyl acetate/acetic acid/water, 9 : 2 : 2; butan-1-ol/pyridine/water, 10 : 3 : 3 parts v/v)[1]. The relative amounts of the monosaccharides present in each hydrolysate were estimated visually from the size and intensity of the spots revealed on chromatograms with ammoniacal silver nitrate and *p*-anisidine hydrochloride. The presence of small amounts of acid-stable aldobiouronic acids was noted in some of the hydrolysates. Neither glucurono-1 → 4-lactone nor hexuronic acid monomethyl ether was detected, thus suggesting that galacturonic acid was the major acid component. No attempt was made to study seasonal or diurnal variations in composition, or to determine the amount of fructan, if any, or cellulose present in the leaves.

For the species so far investigated, the leaf polysaccharides were composed of a variety of monosac-

charide units, galactose, glucose, arabinose, xylose and hexuronic acid being common to them all and mannose and rhamnose frequently occurring in trace amounts. Glucose in the hydrolysates probably arose from starch which, as expected, was predominant in the leaves of many species, including cedar, bean, mint, and *Pelargonium*. Only in Scots pine needles was mannose found in more than trace amounts. Plum leaf polysaccharides were typical of the Rosaceae species examined, with roughly similar amounts of hexose and pentose components. Of particular interest for biosynthetic studies, however, were those leaves rich in pentans. For example, arabinose and xylose together formed a large part of oak and holly leaf polysaccharides, the latter apparently consisting almost entirely of xylan and the pectic substances, while xylan was a major component of wheat and beech leaves, and in yew and *Thuja orientalis* the araban component was predominant.

Wheat plants have already been used successfully to investigate xylan and cellulose biosynthesis[4], and the results presented here indicate the utility of other species for studies of polysaccharide metabolism. In this respect further studies are in progress.

PHYSIOLOGY

Effect of Cytotoxic Agents on Antibody Production

IT has long been known that antibody-production may be inhibited by certain cytotoxic agents, for example, X-radiation, benzene and mustard gas[1]. More recently, the number of agents reported to have this effect has been extended to include cortisone[2], nitrogen mustards[3], colchicine[4], deoxypyridoxine[5], 8-azaguanine[6], various carcinogens[7], β-3-thienylalanine[8], 6-mercaptopurine[9] and amethopterin[10]. Many of these are potent anti-tumour compounds.

The immune response produced by the uptake and catabolism of antigen may be divided into : (1) the induction phase, usually lasting some days, during which antibody is not produced ; (2) the production phase, in which antibody protein is synthesized and released. X-rays and cortisone inhibit the immune response mainly by acting on the induction phase, although they may also affect phagocytosis. If exposure to these agents is delayed until antibody-synthesis is proceeding, their effect is diminished or absent[11]. There is evidence that mustards[12] and 6-mercaptopurine[9] behave similarly. Since these agents strongly inhibit nucleic acid synthesis, and particularly synthesis of deoxyribonucleic acid, and have much less effect on protein synthesis, these observations are relevant to the widely held belief that the induction phase is concerned with antigen-induced changes in nucleic acid metabolism[13].

With other agents inhibiting the immune response, most work has involved repeated injections of agent or antigen or both, so that the critical time of the agent's action is obscured. Such substances as β-3-thienylalanine and deoxypyridoxine, which require special dietary conditions for their action, probably inhibit the immune response largely by interfering with the production of protein, and their anti-tumour action also is probably mainly nutritional.

Table 1

Compound	Dose (mgm./kgm.)	Deaths	Titres ($\log_2$)		
			Test	Control	Difference
Group *A*					
Amethopterin	20	2/5	9	7	+ 2
8-Azaguanine	1,500	3/5	8	7	+ 1
Chlorambucil	35	0/5	8	10	− 2
Daraprim	700	3/5	4	7	− 3
6-Mercaptopurine	150	1/5	3	7	− 4
Methyl acetamide	2,750	1/5	9	8	+ 1
Methyl *bis*(β-chloroethyl)amine	2·4	2/5	8	7	+ 1
Methyl formamide	5,000	1/5	8	8	0
Ribonuclease	2,500	0/5	6	8	− 2
Stilbœstrol	1,000	3/5	7	8	− 1
Triethylene melamine	2	2/5	5	8	− 3
Urethane	1,250	1/5	9	8	+ 1
Group *B*					
8-Azaxanthine	3,000	3/5	7	8	− 1
Benzimidazole	600	3/5	9	8	+ 1
Boric acid	2,500	3/5	9	8	+ 1
Caffeine	200	1/5	8	8	0
Deoxypyridoxine	275	1/5	8	8	0
D-Glucosamine	8,000	3/5	7	8	− 1
Methyl carbamate	1,000	1/5	6	7	− 1
Ovalbumin (hen)	2,500	0/5	7	7	0
Potassium cyanide	7·5	1/5	8	8	0
Serum albumin (bovine)	2,500	0/5	8	7	+ 1
Streptomycin sulphate	750	2/5	8	7	− 1
β-2-Thienylalanine	5,000	1/5	9	8	+ 1

It was thought that investigations along these lines might throw further light both on the initiation of the immune response and on the mode of action of anti-tumour compounds. A wide range of substances was therefore examined, by administering simultaneously single doses of substance and antigen, and titrating antibody 10 days after the injection. By this timing it was hoped to identify substances that interfere with the induction phase of the immune response and do not act simply by impairing protein synthesis.

Male *A2G* mice, weighing 17–25 gm., were given single subcutaneous injections of the compounds studied and, immediately afterwards, 0·2 ml. T.A.B. vaccine intraperitoneally. The compounds were dissolved or suspended in 0·85 per cent saline or, when appropriate, in arachis oil. Controls received 1 ml. saline or arachis oil. Ten days later serum from groups of 5 mice was pooled and titrated for *Salmonella typhi H*-agglutinins. Titres are expressed in Table 1 as logarithms to the base 2, and a reduction of 2 in titre was regarded as significant evidence of inhibition.

Each compound was tested at several dose-levels and, except for the proteins, which present difficulties in this respect, the range included doses that killed a proportion of the animals. Table 1 gives only the results obtained at the higher end of this range. Published toxicity-levels were only a rough guide to dosage, owing partly to concurrent administration of vaccine. Colchicine, for example, could not be tested satisfactorily; its *LD*50, normally 1·75 mgm./kgm. in these mice, was 0·35 mgm./kgm. when the vaccine was given simultaneously.

In Table 1 group *A* consists of compounds that are used clinically against human tumours, leukæmia or polycythæmia vera or that are undoubtedly effective against transplanted animal tumours without requiring special dietary conditions. Group *B* are not effective antitumour agents as judged by these criteria.

Of the 24 compounds, five significantly reduced antibody-production. All were in group *A*. Four of these are clinically useful in human malignant disease. The fifth, ribonuclease, is said to be active against various mouse tumours[14], but there has been no published report of its effect on human neoplasms. No compound ineffective against tumours ever caused significant impairment of antibody-production under the conditions of this experiment, although most of them were tested almost to the limit of tolerance.

Some of the group *A* compounds inhibited antibody-production in non-lethal doses, whereas group *B* included compounds that were ineffective in doses that killed most of the animals. It is therefore unlikely that the inhibition of the immune response was due to general toxicity. In fact, the doses were such that the same proportion of deaths occurred in both groups.

Ribonuclease appears of special interest, but, since it is itself an antigen, the possibility that it acts here by 'antigenic competition' cannot yet be excluded, although the other proteins tested failed to inhibit antibody production. Deoxyribonuclease, 1,000 mgm./kgm., had no effect on the antibody titre.

These preliminary results suggest that this experimental system may provide a useful adjunct to other methods for screening anti-tumour compounds.

I thank Prof. P. C. Koller for a gift of chlorambucil and Mr. W. A. Cope for technical assistance.

Influence of Insulin on the Incorporation of 2-^{14}C-Sodium Pyruvate into Glyceride Glycerol in Diabetic and Normal Baboons

DEPANCREATIZED baboons, deprived of insulin for 4 days, develop a lipæmia and a fatty liver, which may contain 34 per cent of fat when estimated on a wet-weight basis[1,2]. The lipæmia in diabetic rats has generally been attributed to mobilization of fat from the depots. In the baboon, the severity of the lipæmia and the degree of fat accumulation in the liver, particularly in young animals with poorly developed fat depots, suggested that the fat was not mobilized only from the depots, and this warranted a re-investigation of the origin of the fat in the liver and in the plasma. In this communication it is proposed to report on the incorporation of 2-^{14}C sodium pyruvate into the glyceride glycerol in a normal baboon and in depancreatized baboons either receiving insulin or deprived of insulin.

Five animals were used in this study. General data on the animals are given in Table 1.

Table 1. DATA ON EXPERIMENTAL BABOONS

Baboon	Age (yr.)	Weight (kgm.)	Sex	Treatment	Duration of pancreatectomy
440	± 6–7	14	F	Normal	—
422	± 6	12·7	F	Depancreatized on insulin	7 months
355	6	20	M	Depancreatized without insulin	2½ years
448	± 3	11	M	Depancreatized without insulin	2½ months
403	3½	8·1	M	Depancreatized without insulin	9 months

During the course of the experiment, baboons 355, 448 and 403 received no insulin for 96 hr. Each animal received a total of 500 μc. of 2-^{14}C sodium pyruvate (supplied by the Radiochemical Centre, Amersham) in three divided doses injected intravenously as a saline solution over a period of three days. 6 hr. after the last pyruvate injection blood was drawn for the isolation of serum lipids ; at the same time, samples of liver and depot fat were removed and extracted for fats. The triglyceride fractions of the fats were separated by chromatography on silicic acid. The triglycerides were hydrolysed by boiling with alcoholic potassium hydroxide. After extraction of the fatty acids with ether, the glycerol was isolated from the aqueous fraction as glycerol tribenzoate. The substance was recrystallized from methanol and the purity of the material was checked by melting point determination. A further check on the purity of the material was obtained from the wet combustion to carbon dioxide according to the method of van Slyke, Plazin and Weisiger[3]. All samples were counted as barium carbonate with a proportional gas counter. Details of the method used for plating and counting will be published shortly.

The results of the incorporation of carbon-14 into the glyceride glycerol of serum, liver and depot fat in the five baboons are shown in Table 2. We have demonstrated that it is possible to calculate, with a reasonable degree of accuracy, the specific activity of the glycerol from the observed total activity of the unhydrolysed triglyceride fraction after deduction of the activity due to the fatty acids. As limited amounts of triglycerides were obtained from the serum of baboons 422 and 440, we have no information on the radioactivity incorporated into the glycerol in these cases. However, the evidence is very suggestive that the levels in the serum reflect those in the liver and we suspect that the radioactivity in the glyceride glycerol of the serum in these two baboons was low.

Table 2. SPECIFIC ACTIVITIES OF GLYCERIDE GLYCEROL OF SERUM, LIVER AND DEPOT FAT (COUNTS/MIN./M*M*) OF DEPANCREATIZED BABOONS AFTER ADMINISTRATION OF 2-^{14}C SODIUM PYRUVATE

Baboon No.	Treatment	Serum	Liver	Depot fat
355	Depancreatized without insulin	62,916*	73,268* 68,632	3,956* 2,484
448	Depancreatized without insulin	—	99,544	13,064
403	Depancreatized without insulin	120,888* 113,449	111,504*	6,532
422	Depancreatized on insulin	—	0	0
440	Normal	—	0	0

* Calculated.

Attention is directed to the following experimental findings : (1) Carbon-14 is markedly incorporated into the glyceride glycerol of the liver and plasma and to a much lesser extent into the glycerol of the fat depots (Nos. 355, 448 and 403, Table 2). (2) The administration of insulin to the depancreatized baboon completely blocks the incorporation of carbon-14 into the glycerol of liver and depot fat (No. 422, Table 2). (3) Incorporation does not occur in the normal baboon (No. 440, Table 2). (4) The extent of the incorporation is the same in the glyceride glycerol in the serum and in the liver of depancreatized insulin-deprived baboons, as determined by experiment or by calculation (Nos. 355 and 403). (5) The extent of incorporation is from 30 (No. 355) to 200 times greater (No. 403) in the liver glycerol than in the fat depots.

These observations, taken in conjunction with others relating to the fatty acids (unpublished results), would seem to indicate that if fat is mobilized from the depots it is not mobilized as triglycerides of the depots but is hydrolysed before entering the circulation. Furthermore, the close correspondence between the glycerol in the liver and serum would suggest that the triglycerides of the serum are derived from the liver and not primarily from the depots. The blocking effect of insulin on the synthesis of glycerol from pyruvate or from metabolites derived from pyruvate is a noteworthy phenomenon.

We wish to express our appreciation to Mrs. R. Agulhas, Mr. D. Stirling and Mr. L. Notha for technical assistance.

Action of Thyroxine Analogues on Frog Melanocytes

THE melanocyte-stimulating hormones and caffeine darken frog melanocytes by causing dispersion of melanin granules throughout the cell. While the end effect of these two substances on melanocyte opacity is the same, there are several differences in the way melanocyte-stimulating hormone and caffeine bring about dispersion. Lightening of melanocytes is produced by aggregation of melanin granules towards the centre of the cell. We found that triiodothyronine was an effective lightening agent of frog skin previously darkened by melanocyte-stimulating hormone but had no action on caffeine-treated skin. Because of this result we decided to test thyroxine and triiodothyroacetic acid for lightening properties.

Skin from the legs and thighs of eight frogs (*Rana pipiens*) was mounted on rings[1] and arranged in four comparable groups as follows:

Group *A*	LLg1	LTh2	RTh3	RLg4	LLg5	LTh6	RTh7	RLg8
Group *B*	RLg1	LLg2	LTh3	RTh4	RLg5	LLg6	LTh7	RTh8
Group *C*	RTh1	RLg2	LLg3	LTh4	RTh5	RLg6	LLg7	LTh8
Group *D*	LTh1	RTh2	RLg3	LLg4	LTh5	RTh6	RLg7	LLg8

L, left; R, right; Lg, leg; Th, thigh.

Before any observations were made, all skin specimens were soaked in four changes of frog Ringer's solution for 2 hr. Each specimen was maintained in 20 ml. of Ringer's solution throughout the experiment. Changes in the skin were measured with a photoelectric reflexion meter[1]. The initial reading of each sample was taken as its individual base-line, and increase or decrease in reflectance was measured from this.

Two groups were treated with 7·5 units of melanocyte-stimulating hormone per 20 ml. Ringer's solution, and two groups were treated with 20 mgm. of caffeine per 20 ml. Ringer's solution. These quantities of melanocyte-stimulating hormone and caffeine produced approximately the same degree of darkening. The melanocyte-stimulating hormone had been made from bovine posterior pituitary powder[1].

Pronounced darkening occurred in all groups and was followed as a decrease in reflectance for 60 min. At this time sodium triiodothyronine was added to one group treated with melanocyte-stimulating hormone and to one group treated with caffeine. The final concentration of the hormone was 5 μgm. per ml. Changes in reflectance were followed for 50 min. more. As shown in Fig. 1, marked lightening occurred in the group treated with melanocyte-stimulating hormone following the addition of triiodothyronine. There was no change in the group treated with caffeine.

The experiment was repeated using thyroxine as the sodium pentahydrate salt and triiodothyroacetic acid as the diethanolamine salt. Again marked lightening occurred in the groups previously treated with melanocyte-stimulating hormone but not with those treated with caffeine.

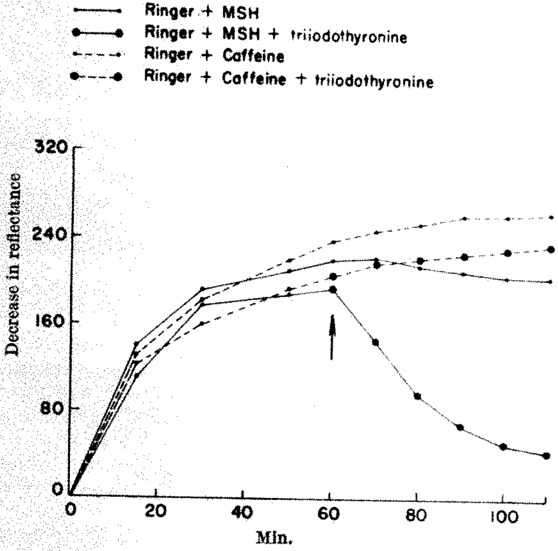

Fig. 1. The effect of triiodothyronine on melanocyte-stimulating hormone- and caffeine-darkened frog skin. Four comparable groups of skins were darkened, two with melanocyte-stimulating hormone and two with caffeine. Decrease in reflectance was followed. After 60 min. triiodothyronine (5 μgm./ml.) was added to one melanocyte-stimulating hormone- and to one caffeine-treated group. Triiodothyronine reversed the darkening action of melanocyte-stimulating hormone but not that of caffeine

The minimum amount required to initiate lightening was 0·5 μgm. per ml. of sodium triiodothyronine, 1·5 μgm. per ml. of thyroxine sodium pentahydrate and 25 μgm. per ml. of the diethanolamine salt of triiodothyroacetic acid. These potency ratios are in approximate agreement with those representing the thyroid hormone actions of these compounds as measured by inhibition of iodine uptake[2].

Melatonin, noradrenaline, serotonin and hydrocortisone can reverse the darkening actions of both melanocyte-stimulating hormone and caffeine. The only compounds known to reverse the melanocyte-stimulating hormone effect but not that of caffeine are acetylcholine and thyroxine and its two analogues[3].

This investigation was supported by a grant from the United States Public Health Service.

Immunochemical Observations on Antisera to Purified Human Growth Hormone

RECENTLY, Hayashida and Li[1] and Read[2] have reported that purified preparations of human growth hormone were antigenic when injected with adjuvants into rabbits. Serum antibodies were demonstrated by the precipitin ring test[1] and by a modification[2] of the tanned cell hæmagglutination method of Boyden[3]. It was also shown that the rabbit antiserum inhibited the biological activity of human growth hormone[1]. Read[2] has employed rabbit antiserum to measure the concentration of growth hormone in human serum by the hæmagglutination–inhibition reaction[3,4]. It seemed essential in assessing the specificity of this method to investigate the purity of the antigen and the specificity of the antisera. In this report immunochemical evidence is presented which confirms that human growth hormone is a potent antigen. In addition, results were obtained which indicate that the Raben preparation of human growth hormone[5] is a highly purified antigen.

A relatively potent antiserum was prepared by the injection of rabbits with human growth hormone prepared by Raben (*Homo* No. 6) according to the following schedule[1]: 2 mgm. of human growth hormone in complete Freund's adjuvant (Difco) was injected both subcutaneously and intraperitoneally on the first and third weeks; on the fifth week human growth hormone was suspended in 1 per cent potassium alum[6] and 1 mgm. was injected by both the subcutaneous and intraperitoneal routes. The total amount of antigen was 10 mgm. per rabbit. The individual rabbit antisera were preserved by the addition of 1 per cent merthiolate to a final concentration of 1 : 20,000 after passage through a 'Millipore' filter.

The immunological specificity of the reactants was studied (1) by passive hæmagglutination and the hæmagglutination–inhibition reaction using tanned sheep erythrocytes conjugated with human growth hormone[2]; (2) by the double diffusion gel plate technique of Ouchterlony as modified by Halbert *et al.*[7]; (3) by the Preer micromethod[8] for double diffusion in agar; (4) by Scheidegger's micromodification[9] of the immuno-electrophoresis procedure of Grabar and Williams; and (5) by the quantitative precipitin method, the nitrogen content of the precipitates being determined by the Markham micro-Kjeldahl method[6]. Human growth hormone from the same lot (*Homo* No. 6) was employed in experiments in Read's and in our laboratories.

The passive hæmagglutination titres of individual rabbit antisera ranged from 1/6,400 to 1/51,200. As little as 1·35 mμgm. nitrogen of antigen was detectable by Read's modification of the hæmagglutination-inhibition reaction. A single band of precipitation was obtained in Ouchterlony plates when undiluted antiserum was tested against dilutions of human growth hormone of 1 mgm./ml. to 10^{-2} mgm./ml. The intense band was completely removed following absorption of antiserum with human growth hormone. Complete fusion of single bands was demonstrated when antiserum was set up against 500 μgm./ml. dilutions of Raben's human growth hormone and Li's human growth hormone[10], a crude preparation of human pituitary, and simian growth hormone. No spur formation to indicate partial identity was found. A band of precipitation was not detected in the agar plates against 2 mgm./ml. of human adrenocorticotrophic hormone (Organon), bovine growth hormone, human chorionic and menopausal gonadotropins, or samples of unabsorbed human serum. Similarly, in studies of the antisera and of purified human growth hormone and crude pituitary extract, and of simian growth hormone by the Preer method, a single disk-like band of precipitation was obtained; the equivalence point was noted at a half dilution of antiserum against 62·5 μgm./ml. of human growth hormone (Fig. 1).

Investigation of the reactants by the immuno-electrophoresis procedure showed, in experiments in which the anti-human growth hormone serum was added to a longitudinal central trough and 500 μgm./ml. of human growth hormone to one lateral well and 1 mgm./ml. of a crude pituitary extract to the other lateral well, a single arc of precipitation against each preparation (Fig. 2, bottom). In this system human growth hormone exhibited the relative mobility of a slow β-globulin. The antigen did not react with horse hyperimmune anti-human serum (Fig. 2, top) or rabbit anti-human globulin. These studies indicate that contamination of purified human growth hormone with serum proteins is negligible. Since antibodies to human growth hormone were not detected in the Paris anti-human serum, it is quite reasonable to assume that the amount of human growth hormone contained in normal human serum is insufficient to elicit antibodies in the horse. The lack of cross-reaction between human growth hormone antiserum and human adrenocorticotrophic hormone (2 mgm./ml.), bovine growth hormone (1 mgm./ml.), and several human sera was confirmed by immuno-electrophoresis. Interestingly, the single, smooth, narrow arc of precipitation found with simian growth hormone revealed a slightly different electrophoretic mobility than did that obtained with human growth hormone, being situated slightly closer to the cathode.

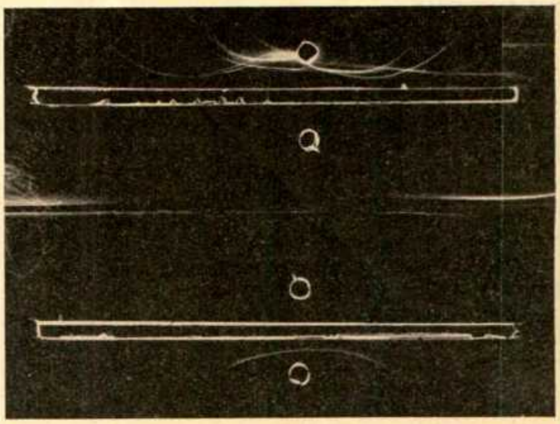

Fig. 2. Top, immuno-electrophoretic precipitin pattern of human sera (upper well) with horse hyperimmune anti-human serum (Paris serum No. 491). No reaction noted between human growth hormone (lower well) and 'Paris serum' (longitudinal trough). Bottom, immuno-electrophoretic precipitin pattern of human growth hormone (500 μgm./ml.) (lower well) with rabbit antiserum (longitudinal trough). No reaction of antiserum with human adrenocorticotrophic hormone (2 mgm./ml.) (upper well)

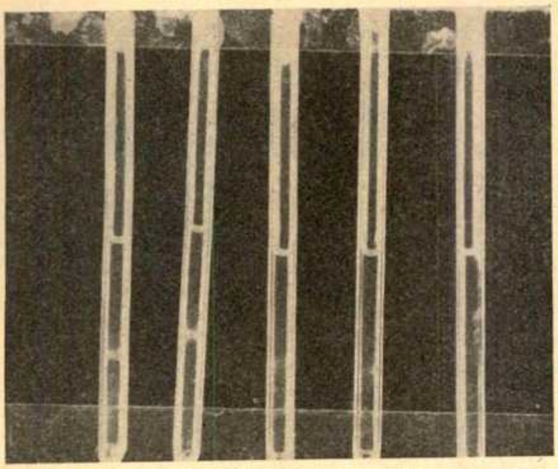

Fig. 1. Preer tubes with rabbit anti-human growth hormone serum in dilutions (from left to right) of undiluted, $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$ and $\frac{1}{16}$ in which the concentration of growth hormone added to the tubes was kept constant at 62·5 μgm./ml. Equivalence point at $\frac{1}{2}$ dilution of antiserum with single band of precipitation

The quantitative precipitin method was used to study the total amount of antigen–antibody precipitated by the antiserum after incubation with varying concentrations of antigen. Preliminary results indicate a precipitin curve consistent with a single antigen–antibody system.

It was also shown that the injection of the same antisera used in the studies described above and human growth hormone by separate routes into hypophysectomized rats completely inhibited the biological activity of the hormone, as assayed by weight gain and by the tibia test.

The results of these experiments indicate that the Raben preparation of human growth hormone is a potent antigen with a high degree of immunological homogeneity. Antisera prepared by injection of human growth hormone into rabbits could not be shown to contain precipitins or other antibodies specifically related to human antigens other than human growth hormone. Evidence was obtained of only a single antigen–antibody system. It seems almost certain from the results that the single system observed actually represents the human growth hormone–anti-human growth hormone reaction. However, the limitations of the immunochemical methods do not exclude the possibility that this preparation of human growth hormone (*Homo* No. 6) is contaminated with trace amounts of other antigens or with weak antigens or, of course, with non-antigenic material.

The physicochemical and structural characteristics of simian and human growth hormone show important similarities[11] and both hormones exhibit biological activity in man. The different electrophoretic mobility of these two antigens was clearly shown by immuno-electrophoresis.

The apparent immunological specificity of purified human growth hormone and its antibodies strongly supports the usefulness of the hæmagglutination-inhibition reaction as a specific method for the quantitative estimation of growth hormone. Evaluation of the Read method as applied to human sera is in progress in this laboratory.

Note added in proof. In additional experiments in which human adrenocorticotrophin prepared by M. S. Raben was used, this material was found to be contaminated with small amounts of human growth hormone, in contrast to the highly purified Organon preparation employed in previous studies.

This work was done with the support of a grant from the National Institute of Arthritis and Metabolic Diseases, National Institutes of Health, U.S. Public Health Service.

Effect of Heavy Water on Different Types of Muscle and on Glycerol-extracted Psoas Fibres

On considering the suggestion that more attention be directed to the role of water in biochemical reactions[1], the possibility was entertained that by using heavy water further information might be obtained about physical-chemical processes in muscle. An investigation was therefore undertaken to observe the effects of heavy water on heart, intestinal, uterine and voluntary muscle.

Concentrations of heavy water between 99·8 and 25 per cent decreased the force of contraction and the rate of the spontaneously beating, isolated atria of the frog (*Xenopus laevis*). Similar effects have been observed previously on the frog heart[2]. The onset of the effects on the atria of *Xenopus* was noted 50 sec. after immersion in heavy water-Ringer solution. With 99·8 per cent heavy water, the force decreased by 90 per cent of its basal value after 2½ min. In most instances the atria either stopped beating or slowed down to one impulse every 5 or 7 min. after being immersed for about 20 min. in heavy water. The velocity of contraction was reduced[3], as was also the velocity of relaxation (Fig. 1).

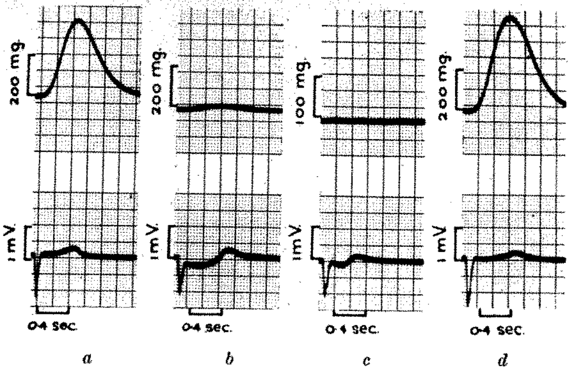

Fig. 1. Simultaneous recordings of tension (upper tracing) obtained with an RCA transducer and unipolar surface electroatriogram (lower tracing). *a*, Basal recording in normal water–Ringer; *b*, after 5 min. in 99·8 per cent heavy water–Ringer; *c*, after 17 min. in 99·8 per cent heavy water–Ringer (note no recordable contraction with increase in gain of amplifier); *d*, recovery after 15 min. in normal water–Ringer (note that the force of contraction is greater than in the basal recording)

Simultaneous recordings of the surface electroatriogram (Fig. 1) revealed that 99·8 per cent heavy water reduced the amplitude of the depolarization wave by about 13 per cent on the average. On the other hand, the amplitude of the repolarization wave was increased after 5 min. and then decreased towards the basal value; changes in the configuration of the repolarization wave were obvious. The duration of depolarization and repolarization increased by approximately 40 and 60 per cent, respectively. The interval between the onset of the electrical impulse and the contraction increased by about 90 per cent of the basal value. These manifestations in the mechanical and electrical parameters were reversed after transferring the atria to normal water-Ringer solution.

A particularly interesting feature was the dissociation in response of the electrical and contractile events. In 4 out of 10 experiments the contraction was not detectable while the impulse continued to be propagated (Fig. 1). Hodgkin and Horowicz produced similar dissociation of the twitch and action potential of single muscle fibres with high concentrations of sodium chloride[4].

After these preliminary experiments, attempts were made to elucidate the sites where heavy water affected the contraction of muscle. First, electrical stimulation of the heavy water-inhibited atria resulted in an action potential. The contractile response was, however, small and never greater in force than that seen prior to the arrest of the heart. It appears, therefore, that the membrane of the muscle fibres of the atria remained excitable while the spontaneous impulse was suppressed by inhibition of the pacemaker by heavy water.

Secondly, chemical stimulants such as adrenalin, noradrenalin and veratrine increased the force of contraction of atria treated with 75 per cent heavy water. In passing, it may be mentioned that heavy water also diminished the force of contraction of isolated rabbit duodenum. However, 75 per cent heavy water did not modify the effects of acetylcholine on rabbit duodenum and of oxytocin on the guinea pig's uterus. A high concentration of calcium chloride (4·5 m*M*), sufficient approximately to double the force of contraction in untreated atria, had no inotropic effect on atria treated with heavy water. Whereas in untreated atria both adrenalin and noradrenalin increased the rate of rhythmic contraction, this chronotropic effect did not occur in the presence of heavy water.

After establishing that heavy water decreased markedly the force of contraction of voluntary muscle (rectus abdominis of frog and rabbit psoas), a third series of investigations was carried out with heavy water on psoas muscle fibres extracted with glycerol[5]. In the case of these glycerol-extracted fibres, however, heavy water did not retard the degree of shortening induced by adenosine triphosphate. To increase the probability of deuterium exchange, living fibres were activated by electrical stimulation while submerged in heavy water and then extracted in 99·8 per cent heavy water at 4° C. instead of in 50 per cent glycerol. The response of the fibres treated in this way was again not affected by adenosine triphosphate dissolved in heavy water–salt solution. Further experiments on the glycerol-treated fibres with other nucleotides revealed that heavy water reduced the amount of shortening produced by inosine triphosphate and uridine triphosphate but not the amount produced by adenosine triphosphate and cytodine triphosphate (Fig. 2). In so far that the difference in molecular structure between inosine triphosphate and adenosine triphosphate on one hand and between uridine triphosphate and cytodine triphosphate on the other is in the 6th position of the purine and the pyrimidine rings respectively, it is suggested that reactions involving the 6th position of either inosine triphosphate or uridine triphosphate were retarded by deuterium.

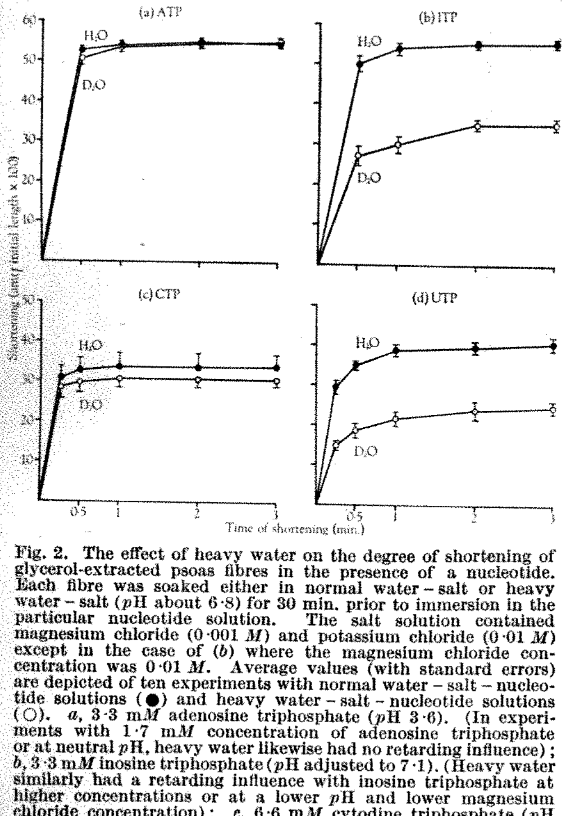

Fig. 2. The effect of heavy water on the degree of shortening of glycerol-extracted psoas fibres in the presence of a nucleotide. Each fibre was soaked either in normal water – salt or heavy water – salt (*p*H about 6·8) for 30 min. prior to immersion in the particular nucleotide solution. The salt solution contained magnesium chloride (0·001 *M*) and potassium chloride (0·01 *M*) except in the case of (*b*) where the magnesium chloride concentration was 0·01 *M*. Average values (with standard errors) are depicted of ten experiments with normal water – salt – nucleotide solutions (●) and heavy water – salt – nucleotide solutions (○). *a*, 3·3 m*M* adenosine triphosphate (*p*H 3·6). (In experiments with 1·7 m*M* concentration of adenosine triphosphate or at neutral *p*H, heavy water likewise had no retarding influence); *b*, 3·3 m*M* inosine triphosphate (*p*H adjusted to 7·1). (Heavy water similarly had a retarding influence with inosine triphosphate at higher concentrations or at a lower *p*H and lower magnesium chloride concentration); *c*, 6·6 m*M* cytodine triphosphate (*p*H 4·35); *d*, 6·6 m*M* uridine triphosphate (*p*H 3·56). (Insufficient material precluded studies on uridine triphosphate and cytodine triphosphate at varying concentrations and *p*H's)

As the degree of shortening of the contractile proteins was not necessarily reduced by heavy water, the possibility exists that either the substitution of deuterium for hydrogen in the contractile proteins did not in itself retard the response or that little exchange took place. Taken in conjunction with the observed dissociation of the electrical and contractile events in the living muscle, it seems likely that the energy transfer mechanism between the membrane and the contractile protein is retarded or blocked by the isotopic effect of deuterium. The response produced by the drugs, for example adrenalin, could be due to the activation of the energy transfer process. Calcium ions, on the other hand, could not counteract the effects of heavy water. The manner whereby heavy water inhibited the pacemaker remains to be elucidated.

It thus appears that heavy water can be useful as a tool in the dissection of the physical-chemical processes of muscle contraction. Full details of the experiments will be published elsewhere.

Grateful acknowledgement is made to Prof. J. Gillman for his helpful encouragement and critical interest. My thanks are due to Dr. S. Brenner for suggesting the use of heavy water, and for helpful discussion, to Drs. P. R. Levy and A. G. Szent-Györgyi for advice, and to Mr. A. J. Oliphant for invaluable technical assistance.

Effect of Parathyroid Extract on Citric Acid Concentration in the Rat Kidney

THE influence of parathormone on the level of citric acid in plasma was first mentioned by Sjöström[1], who found an elevated level of citric acid in patients with hyperparathyroidism; this finding was afterwards confirmed by other authors. The effect of parathormone on the citric acid level was verified by Neuman *et al.*[2], who measured the amount of the acid in the venous blood of bones and found an elevated level after the application of parathormone. The purpose of the work reported in this communication was to prove this effect of parathormone on the metabolism of citric acid also in other tissues and to try to explain the mode of action.

The concentration of citric acid in the skeleton and kidneys of female rats, 150–160 gm., was observed. The rats received 10 U. of parathyroid extract ('Parathyroid', Paines and Byrne) intramuscularly, and were killed at intervals of 1–24 hr. after the injection. The kidneys were immediately homogenized in liquid air; the dissected left femur was extracted for 7 days in a solution of 10 per cent trichloracetic acid. Citric acid was determined by Gey's method[3]. In order to explain the mode of action of parathormone, the parathyroid extract was given

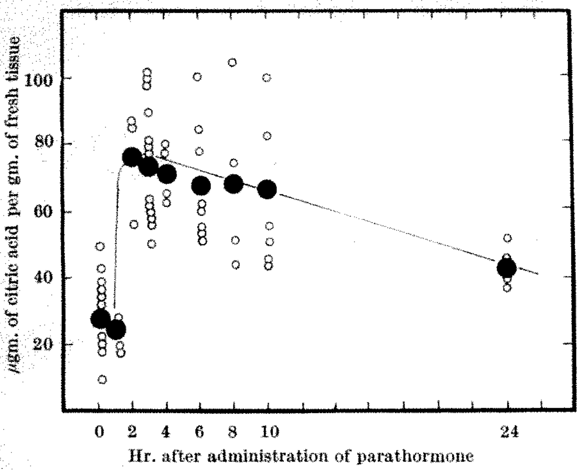

Fig. 1

3 hr., and a freshly prepared sodium fluoracetate solution (5 mgm./kgm. body-weight) was given 1 hr., before the animal was killed, to obtain the maximal effect of both compounds.

The results are presented in Table 1 and Fig. 1. The extract of parathyroid glands raises sharply the concentration of citric acid in the kidneys after latent periods of 60 min. The elevation of citric acid is statistically significant ($P \leqslant 0{\cdot}01$) in comparison with the control group. It reaches its maximum in 2–3 hr. after the injection. The concentration of citric acid remains at approximately the same level up to 10 hr. after the injection and returns to about the starting concentration after 24 hr.

After the application of sodium fluoracetate, which inhibits the further degradation of citric acid in the Krebs cycle, the concentration of citric acid in the kidneys rises fifty times[4] within 1 hr. When sodium fluoracetate and parathormone were given so as to achieve the maximum effect of both compounds simultaneously, there was statistically no significant difference in the content of citric acid in the kidneys compared with the control group ($P = 0{\cdot}1$).

The content of citric acid in bones remained the same after administration of parathormone alone or in combination with fluoracetate; there was no significant difference between these groups.

Our findings point to the fact that parathormone influences the metabolism of citric acid not only in the bones but also in other tissues—in our case in the kidneys of rats. We assume that the parathormone may interfere directly with the Krebs cycle and that it may act either by raising the synthesis of citric acid or by inhibiting its degradation. The blocking of citric acid metabolism in the Krebs cycle by fluoracetate did not enhance the effect of the parathormone on the concentration of citric acid. It appears, therefore, that the interference of parathormone with the metabolism of citric acid is caused rather by inhibition of its further degradation than by augmentation of its synthesis. Similar effect has been described in the mode of action of vitamin D[5]. As, however, the quantity of citric acid is much higher after administration of fluoracetate than after parathormone, it should be taken into account that a raised synthesis of citric acid, owing to the effect of parathormone, can be hidden in the great excess of citric acid and that the relatively small changes induced by the parathormone are scarcely detectable by the method used. The same explanation can be applied to the negative response of bones to the administration of parathormone and fluoracetate because of high levels of citric acid in bones under normal conditions.

The question of the mode of interference of parathormone with the Krebs cycle is not fully explained by our findings and requires further investigation.

Antithyroidal Effect of Some Fresh Plants on Guinea Pigs

SEVERAL investigators have described a goitrogenic effect of various *Brassica* plants (see Greer's review[1]). Papers have appeared in recent years dealing with the goitrogenic properties of milk from cows fed on various species of *Brassica*[2-5]. As, however, no goitrogenic substances had until recently been proved in the edible parts of *Brassica* (except in rutabaga (*Brass. napus* var. *esculenta*) and turnip[1]) quite a number of problems remained unanswered. Recently, Altamura *et al.* isolated L-5-vinyl-2-thiooxazolidone also from fresh cabbage[6]. On the basis of our previous studies[5] we decided to study the effect of *Brassica* and other plants on the thyroid gland of laboratory animals with the aid of newer methods.

12 male guinea pigs were divided into three groups (4 animals per group) and maintained 48 hr. on tap-water only. Then they received vegetables (group I carrot, group II kohlrabi and group III kale). After 24 hr., in which they consumed approximately 70–

80 gm. of vegetables per animal, they were injected with 3 μc. iodine-131 in 0·5 ml. of physiological saline intraperitoneally. 4 hr. later they were killed under ether anæsthesia. Radioactivity of thyroid glands was determined after hydrolysis in 30 per cent sodium hydroxide with the aid of a scintillation counter and the thiocyanate-level in serum was determined by Aldridge's method[7].

Table 1. EFFECT OF CERTAIN PLANTS ON ACCUMULATION OF IODINE-131 ON THE THYROID GLANDS AND ON THIOCYANATE-LEVEL IN SERUM

Plant	Iodine-131 in thyroid gland (c.p.m./mgm.)	Thiocyanate in serum (mgm. per cent)
I Carrot	5,549 ± 994	0·053 ± 0·012
II Kohlrabi	3,343 ± 636	0·550 ± 0·161
III Kale	2,778 ± 601	1·605 ± 0·807

Accumulation of radioiodine after feeding kohlrabi and kale was significantly lower than after feeding carrot ($P < 0.02$). Kohlrabi and kale were used because of their different contents of thiocyanate[8]. The results indicated that thiocyanate may indeed be a cause of the antithyroidal effect of these plants, but some other agent must likewise be present. Further experiments are in progress.

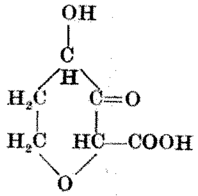
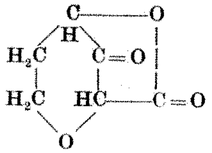
Activity of a Substance extracted from the Fermentation Products of *Acetobacter aceti* on Ehrlich's Ascites Tumour Cells

DURING the bacterial fermentation of alcohol to acetic acid, highly active molecules capable of regulating oxidation-reduction potentials must be elaborated by the bacteria, but as yet no extensive investigations in this field have been carried out. A substance possessing interesting biological activities and with some well-defined chemical characteristics has recently been isolated from vinegar[1,2]. This substance, obtained by extraction and purification processes similar to those used for cytochrome isolation, proved to have a marked oxidizing ability and, in particular, exerted an intense facilitatory activity on some catalase systems. It also markedly inhibited the growth of human tumour cells cultivated *in vitro*. When the substance is added to the medium in very low concentration in *in vitro* respiration experiments (Warburg technique) with Ehrlich's ascites tumour cells, an increase of respiration occurs: on the other hand, a most important finding is that respiration is blocked at higher concentrations. This interference with respiratory processes is much less marked on non-tumour cells. These effects would support Antoniani's concept[3] of the extreme sensitivity of tumour cells to substances capable of interfering with their respiratory systems, which, owing to discontinuous pathways, are particularly labile.

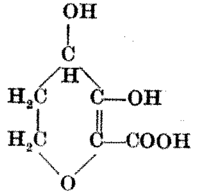
The substance, previously characterized by extraction methods and chromatographic purification, has been recently isolated in the pure state. It is a white powder with a melting point of 184° C. Its probable structural formula, derived from the elementary analytical data, from determination of the molecular weight (camphor method), infra-red spectrum, chemical groups and break-down studies, is:



It may be in equilibrium with a γ-lactone form:



or may exhibit an enolic form as follows:



The compound is easily soluble in water; the solutions are acid (about pH 3·2) and slightly yellow.

Its toxicity is very low: 2·5 gm./kgm. intravenously are not lethal for mice. The addition of the compound (concentration 1 : 100,000) to the perfusing fluid in the Straub frog heart preparation induces a digitalis-like pattern without producing heart block.

Two types of experiment have been performed with samples of the pure substance in saline adjusted to pH 7·4.

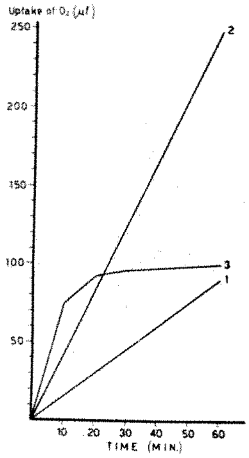


Fig. 1. 1, Ehrlich ascites cells, 1·0 ml. (2·9 mgm. nitrogen by Kjeldahl); ascites serum, 1·1 ml.; glucose solution, *M*/100, 0·5 ml.; substance, 0
2, Ehrlich ascites cells, 1·0 ml. (2·9 mgm. nitrogen by Kjeldahl); ascites serum, 1·1 ml.; glucose solution, *M*/100, 0·5 ml.; substance, 0·6 mgm.
3, Ehrlich ascites cells, 1·0 ml. (2·9 mgm. nitrogen by Kjeldahl); ascites serum, 1·1 ml.; glucose solution *M*/100, 0·5 ml.; substance, 3 mgm.

Table 1. Mice with Ehrlich's Ascites Tumour

No. of animals		Days after tumour transplantation					
		0	2	4	6	8	10
30 controls	body-weight	19·60	20·10	23·10	25·60	26·9	31·2
	cells/ml. present in ascitic fluid	25,000,000	89,600,000	146,700,000	165,800,000	—	—
30 treated (3 mgm./day of the substance)	body-weight	19·83	20·02	20·20	21·70	21·3	22·3
	cells/ml. present in ascitic fluid	25,000,000	38,450,000	27,650,000	37,900,000	—	—

The effects *in vitro* on the respiration of Ehrlich's ascites tumour cells have been studied using the Warburg technique, while in the *in vivo* experiments Ehrlich's ascites tumour in the white mice were used.

The results of the *in vitro* experiments are illustrated in Fig. 1. When the compound is added, in doses of 0·6 mgm., to the fluid containing the ascites tumour cells (equivalent to 2·9 mgm. nitrogen) and substrates, made up to a total volume of 2·8 ml., a marked increase in cellular respiration is seen in the first hour. The addition of 3 mgm. of substance, under the same experimental conditions, produces increased respiration for the first 20 min. and then a complete inhibition of respiration.

The results of the *in vivo* experiments are reported in Table 1. The neutralized solution was injected daily at a dose of 3 mgm./animal/day beginning from the second day after the intraperitoneal inoculation of the ascitic fluid containing the tumour cells.

Treated mice showed nearly complete inhibition of tumour growth (there was no increase in body-weight) and very marked decrease of number of cells per ml. of ascitic fluid.

These results confirm the marked *in vivo* activity of this new substance in inhibiting the development of the particular type of tumour cell used in these experiments.

BIOPHYSICS

Reversible Supercontraction of β-Keratose

Peacock[1] has examined the X-ray diffraction patterns from Lincoln wool supercontracted by oxidation in peracetic acid. An observation made by Whiteley[2] using Alexander's[3] peracetic acid–ammonia technique to separate the protein components in wool[4] was that, following supercontraction in peracetic acid, the fibres increase in length when the α- and γ-keratoses are dissolved out by the ammonia solution. Mercer found it possible to prepare a birefringent fibre from the protein extracted from wool by urea-reducer solutions which showed dimensional changes as the *p*H was altered[5].

We now find that β-keratose, which remains as a continuous fibre containing some 10 per cent of the original protein[3], will contract again if taken from alkaline solution into solutions of lower *p*H. Moreover, the change in length of the β-keratose fibre as the *p*H is altered is reversible, without hysteresis, and can be repeated many times with a single fibre. The experiment has been carried out with oxidized Merino and Lincoln wools, human hair and horse hair at temperatures between 30° and 60° C.

In a typical experiment a single horse hair about 2 cm. long was mounted in a setting frame and oxidized for 17 hr. at 40° C. and 12 hr. at 60° C. by an approximately 5 per cent w/v peracetic acid solution. The hair was then extracted with 0·1 *N* ammonia and contraction-extension experiments were carried out by placing the extracted fibre in solutions of various *p*H values made from mixtures of 0·01 ammonia and 0·01 *N* acetic acid. The length of the fibre was measured with a travelling microscope after equilibration at each new *p*H at 23° C. for ½ hr. The results are shown in Fig. 1.

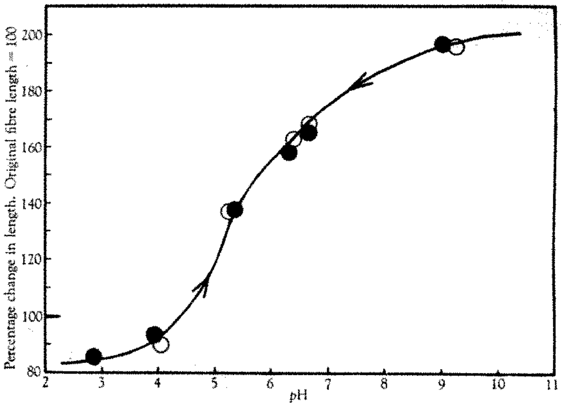

Fig. 1. Reversible length change of β-keratose from horse-hair as the *p*H is altered. Full circles : *p*H falling ; open circles : *p*H rising

When examined by X-ray diffraction, Lincoln wool appears to be exceptional in giving a pattern indicative of α-protein both after mild oxidation (see Peacock[1], for example) and after contraction of the alkali-extended fibres. On the other hand, prolonged oxidation results in the appearance of a pronounced β ring at 4·65 A., and this change in the diffraction pattern, often accompanied by some preferential orientation on the meridian (the cross-β pattern) associated with the supercontracted state, is the more usual observation in other keratin fibres oxidized with peracetic acid. After extraction of these oxidized fibres with ammonia, the insoluble residue, when alkaline, always gives only a diffuse protein-type pattern in spite of attempts to orient the material by stretching. As the *p*H is lowered, a pronounced sharpening of the 4·65 A. reflexion develops and this shows a slight preferred orientation on the meridian after carefully stretching the wetted fibres. These changes have been followed particularly in the more robust horse hair. In contrast to these findings, neither dimensional nor configurational changes have been observed in thin films of α-keratose cast from ammonia (they give a well-oriented α-pattern) and subjected to the same changes of *p*H as those applied to the extracted fibre.

The relationship between supercontraction in wool and hair and the contraction of muscle has been repeatedly pointed out by Astbury[6,7], and there is evidence that supercontraction occurs during the synæresis of actomyosin gels[8]. Moreover, the ease with which actomyosin undergoes supercontraction in the presence of hydrogen ions[9] supports the evidence of Goodall[10] that a proton-transfer mechanism might be responsible for the development of tension in muscle. The dimensional changes of β-keratose as the *p*H is altered suggest again at least a partial contraction to the cross-β configuration, though apparently in this case, since the X-ray diagram given by the extended fibre is so diffuse, not from a well-defined α-configuration but from some intermediate less-regular state.

We wish to thank Prof. W. T. Astbury for his advice and encouragement in this investigation, which is supported in part by the Muscular Dystrophy Associations of America, Inc., and will be reported in detail elsewhere.

PLANT PHYSIOLOGY

Effect of Infection by *Xanthomonas malvacearum* (E.F.S.) Dowson on Respiration-rate of Cotton Leaves

Potted plants of susceptible Domains Sakel cotton (*Gossypium barbadense*, L.) and its synthesized blackarm-resistant strains containing B_2 or $B_2 + B_3 + B_6$ genes were sprayed when about three months old with a standardized water-suspension of *Xanthomonas malvacearum* taken from three-day-old cultures of a recent isolate. The plants were kept in the shade under glass bell-jars for 48 hr. after inoculation. The leaves used for determining respiration-rates were chosen from among fully expanded leaves 5 cm. in diameter situated at the ninth to thirteenth nodes of the stem.

The number of spots on inoculated leaves ranged from 80 and 200 per leaf. A Thoday respirometer was used for determining oxygen uptake, which was taken as a measure of respiration-rate. Two leaves, of about 1 gm. fresh weight, were placed in each respiratory chamber with the petioles dipped in distilled water in a specimen tube. The respiratory chamber also contained 10 ml. of 5 per cent potassium hydroxide and a piece of Whatman folded filter paper No. 40 to increase the absorption surface. The chambers were placed in a temperature-controlled water-bath adjusted at 30° C. Readings were taken 2 hr. after the experiment had been started and continued thereafter at 8-hr. intervals. The first reading in all experiments was discarded to avoid misinterpretation of handling effects.

In 1957, two sets of experiments were carried out using leaves of susceptible Domains Sakel. In the first set, uninoculated (control) leaves as well as leaves 4 and 10 days after inoculation were used. The second set included control leaves, and leaves taken 10 and 16 days after inoculation. The experiments were run for 2 days. The respiration-rate of the leaves of resistant strains of Domains Sakel containing B_2 and $B_2 + B_3 + B_6$ was also examined in uninoculated leaves (control) and in leaves 10 and 16 days after inoculation. These experiments were run for 4 days.

In 1958, experiments were carried out with the susceptible Domains Sakel using uninoculated leaves (control) and leaves 4, 8, 12 and 16 days after inoculation. The leaves were cut at noon, washed thoroughly with distilled water, blotted dry with filter paper, weighed and placed in the respiratory chamber. The experiments were run for 4 days and thus respiration was actually measured continuously from the fifth to the twentieth day after inoculation.

Angular leaf spots first appeared on susceptible Domains Sakel 5–7 days after inoculation as minute, water-soaked, dark green spots mainly on the undersurface of the leaf. The spots increased in size, becoming 2–4 mm. in diameter in a few days, but did not attain their characteristic brown colour until 15–16 days after inoculation. On the resistant strains of Sakel, development of disease symptoms could only be ascertained between the eighth and tenth day after inoculation, when minute, pin-head, dark green, dry round spots appeared. The spots turned dark brown with age but remained very small.

The results of experiments in 1957 (Table 1) showed that there was a general depression in the respiration-rate of the inoculated leaves of susceptible Domains Sakel and its resistant strains compared with the controls. The depression seemed to reach its maximum in susceptible Sakel earlier than in the resistant strains.

The picture was clearer in the 1958 experiments, where the respiration-rate of Domains Sakel leaves was followed up from the fifth to the twentieth day after inoculation. Fig. 1 shows that maximum depression in respiration-rate was reached between the fifth and seventh days after inoculation. Respiration-rate then increased continually until the twentieth day, when no further readings were recorded.

Fluctuations in respiration-rate seem to coincide with the development of disease symptoms. Thus the early depression in respiration coincides with the period in which the bacteria enter the stomata and multiply in the stomatal chambers, blocking the stomata and suppressing gas exchange. This phase of the course of disease takes place in both susceptible and resistant strains of Domains Sakel. About the time disease symptoms first appear as pinhead spots, respiration reaches its minimum (that is, 5–7 days

Table 1. Respiration-Rate of Leaves of Resistant and Susceptible Strains of Domains Sakel Cotton inoculated with *X. malvacearum* (1957 Experiments)

Cottons	Oxygen uptake (ml. dry gas/ 10 gm. fresh wt./hr.)			
	Days after inoculation			
	Control	4	10	16
Susceptible Domains Sakel				
Means of three experiments	6·15	5·28	5·90	—

Difference from control (per cent)			−5·1	+38·00
Sakel containing B_2				
Means of two experiments	5·39	—	4·79	4·88
Difference from control (per cent)		—	−11·1	−9·5
Sakel containing $B_2+B_3+B_4$				
Means of two experiments	5·39	—	4·62	5·53
Difference from control (per cent)		—	−14·3	+2·6

after inoculation in the case of susceptible Sakel and later in that of resistant strains). The increase in respiration-rate of the leaves of susceptible Domains Sakel that follows coincides with the increase in the size of the spots and the disintegration and collapse of the spot cells. The increase may be attributed partly to the evolution of the gas previously accumulated in the tissues, and partly to increased respiratory activity of the cells resulting from infection. The amount of gas contributed by the bacteria themselves to carbon dioxide output of affected leaves is difficult to assess but is unlikely to be of much significance.

In the resistant strains, the spots remain pinhead in size and the respiration-rate increases to about normal after their appearance. In this instance the depression in carbon dioxide output is less than in susceptible Sakel, but continues for a longer period before it returns to more or less the normal rate.

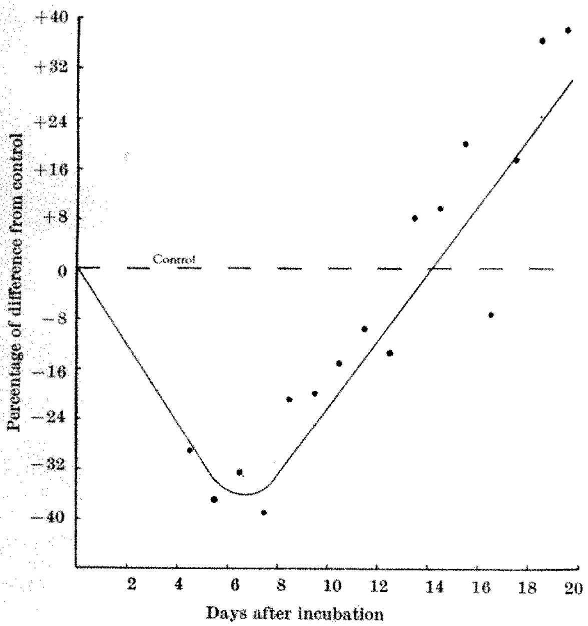

Fig. 1 Relationship between respiration-rate and age of inoculation

The damage caused to the host is little, if any, and does not provoke marked cell respiration.

Chemical Nature of the Cell Wall of the Green Algae, *Codium*, *Acetabularia* and *Halicoryne*

The chemical nature of the carbohydrates which constitute the main cell wall of the algae belonging to Codiaceae and Dasycladaceae has remained thus far largely obscure. Though the cell wall of *Codium* was said to consist of callose and pectin together with some cellulose[1], no chemical characterization of callose and algal pectin has yet been achieved, their occurrence being recognized merely by staining reactions and solubility tests. Likewise, no unequivocal proof for the presence in *Codium* of true cellulose has hitherto been obtained, although its occurrence has occasionally been reported[2,3]. As for the cell-wall constituents of the members of Dasycladaceae almost nothing is known at present except the incrustation of calcium in the cell wall.

As a continuation of the biochemical researches of algal cell wall by one of us[4], we have been engaged in the study of the cell-wall constituents of the green algae from different taxonomic groups with the view of obtaining information about the phylogeny and systematic position.

The present communication deals with the studies on *Codium fragile*, *Acetabularia calyculus* and *Halicoryne wrightii*.

The air-dried sample of each seaweed was soaked in 1 per cent hydrochloric acid for 24 hr. at room temperature to remove calcium carbonate. It was then treated successively with 1·25 per cent sodium hydroxide and 1·25 per cent sulphuric acid at 100° for 30 min. and the residue was bleached with 1 per cent sodium chlorite. The crude fibre thus obtained retained the membrane structure almost unchanged and showed neither anisotropy nor staining reactions for cellulose.

Hydrolysis of the crude fibre with sulphuric acid and examination of the products by paper chromatography revealed the main constituents to be mannose. A trace of glucose as detected in the hydrolysate arose presumably from starch which could not be removed by the above treatment. The crude fibre is insoluble in sodium hydroxide at any concentrations, but easily soluble in 50 per cent zinc chloride, less in 50 per cent stannic chloride and slightly in Schweizer's reagent. Hence the purification was effected by dissolution in zinc chloride followed by precipitation with acetone. As the product contained about 2 per cent of ash, of which the major part was silica, it was removed by the method of Feigl and Krumholz[5]. The purified substance is a white powder with an ash content less than 0·1 per cent. Elementary composition corresponded to hexosan. Calculated for $C_6H_{10}O_5$, C 44·44, H 6·22 ; found, C 44·23, H 6·09 (*Codium*) ; C 44·24, H 6·17 (*Acetabularia*) ; C 44·31, H 6·12 (*Halicoryne*). $[\alpha]_D$ in 50 per cent zinc chloride −46·1° (*c.* 1·41, *Codium*) ; −50·6° (*c.* 1·54, *Acetabularia*) ; −46·1° (*c.* 1·41, *Halicoryne*). Hydrolysis with 40 per cent hydrochloric acid at 0° yielded 91–93 per cent of mannose. On the paper chromatogram no other spots than that of mannose could be detected. Mannose phenylhydrazone (m.p. 199°) was obtained in nearly the theoretical yield[6]. When oxidized with periodate 0·96 mole of it was consumed and 0·125 mole of formic acid was produced per unit $(C_6H_{10}O_5)$ of the preparation from *Codium*. Assuming a straight-chain structure with 1,4 linkage the yield of formic acid indicates a degree of polymerization of 16.

These results, taken together with the resemblance in specific rotation to the mannan of ivory nut (− 44·1°) and salep (− 35·0°), both of which are known to be β-1,4-linked, would indicate that the mannans from *Codium*, *Acetabularia* and *Halicoryne* are constructed in a similar manner.

Other *Codium* species such as *C. latum* and *C. tomentosum* also contain mannan as main cell-wall constituent, whereas in *Udotea*, *Chlorodesmis* and *Halimeda*, all of which are usually included in Codiaceae, mannan is replaced by xylan with β-1,3-linkage.

The significance of these findings in connexion with phylogeny and taxonomy will be discussed elsewhere.

We wish to express our gratitude to Profs. S. Inoh and S. Segawa as well as to Drs. M. Chihara and S. Kamura for their generous support in this work.

BIOLOGY

Attrition of Incisors of Grazing Sheep

UNDER New Zealand conditions of sheep-farming, incisors of grazing sheep wear much more rapidly on improved pasture, chiefly ryegrass (*Lolium perenne*) and white clover (*Trifolium repens*), than on the finer native pastures of low carrying capacity. The cause is not nutritional in the generally accepted sense, however[1]. It would rather seem that certain substances in the herbage of 'improved' pastures dissolve the teeth, the process being aided by the abrasive action of the plant fibre. Wear is also increased in mouths with certain undesirable anatomical characteristics which appear to be hereditary in origin.

Differences in chemical compositions of enamels and dentines of sheep's teeth of various breeds and from farms on country of dissimilar soil types are not correlated with the extent of tooth wear[2].

The thin layer of enamel on the incisal surface of sheep's teeth is worn through approximately two months after eruption, hence the problem is concerned with the rate of wear of primary dentine and, at a later stage, secondary dentine.

Electron micrographs of the biting edge of worn incisors showed that the dentine surface was subjected to both chemical and abrasive action. The chemical action was thought to be due to the organic compounds in the herbage complexing the calcium phosphate (apatite), but before this could be checked by studies with the electron microscope it was essential to understand the microstructure of the organic and inorganic components of dentine more fully[3] and to develop a technique which enabled the intensity and nature of etching to be recorded (Hall, D. M., unpublished work). Experiments were then made to compare the etching produced by fractions of juices of pasture plants on surfaces of fresh dentine polished smooth by metallographic techniques. The fractions examined were: (1) organic acids from herbage at their original concentrations and *p*H (6·0–6·5) for chelating action on the calcium; (2) cell fluids, obtained by ether cytolysis, containing in addition sugars, inorganic and organic phosphates, amino-acids and polypeptides, capable of chelating or dissolving calcium; (3) freshly expressed juices of grasses and clovers containing enzymes in addition to substances of (1) and (2).

These studies have shown that fraction (3) produced the strongest etching, and indicated that this reaches a maximum during the lush spring growth. It was also evident that the central non-calcified core of the odontoblast process was etched by fresh grass juice at a faster rate than the dentinal matrix and thereby released long lengths of the membrane-like sheaths enclosing the process.

The results indicate that the majority of the etching is due to proteolysis and that such weakening of the bonding material of the tooth would facilitate its wear by attrition. Rouiller has observed that an organic component bonding the particles of dentine is digested by plant proteinases such as papain[4,5]. It is considered, therefore, that the digestive action of the proteinases of actively metabolizing leaves on the organic components of dentine could be an important factor contributing to the wear in teeth of grazing sheep.

This investigation is being continued.

Rhizosphere Effect on Soil Algae

VERY few studies of the effect of the rhizosphere on soil algae have been made in the past[1], and in a recent review Starkey[2] states that it is possible that algal populations may even be decreased in the root zone. This communication presents evidence for a well-marked rhizosphere effect on soil algae by the roots of cultivated tea plants nominally referable to the Assam variety of *Camellia sinensis* (L) O. Kuntze.

Roots from one-year old seedlings were removed from the nursery beds and the soil from the top 5 cm. of the roots was scraped off with a sterile spatula. The top 5 cm. of soil from adjacent bare areas of the same bed was used as the control. Modifying the method described by Agnihothrudu[3], 5 gm. each of

Table 1. Presence or Absence of Algae in Various Dilutions of Bristol's Solution

	Dilution

Rhizosphere soil	+	+	+	+	+	+	+
Control soil	+	+	+	+	+	−	−

control and rhizosphere soil samples were used for preparing a series of ten dilutions in Bristol's solution[4], the initial dilution being 1/10, and each higher dilution made by taking 10 ml. of the lower dilution and adding it to 90 ml. of sterile Bristol's solution. Three replications of each dilution were made and growth was estimated after three months by the presence or absence of algae in the flasks (Table 1). Previous observations on the soil algae of our subtropical soils showed that this period was sufficient for growth to occur and also that Bristol's solution was the most suitable of several media tried.

There is at present no reliable method of estimating numbers of soil algae in a mixture of unicellular, colonial and filamentous forms and the presence or absence of visible growth remains the only satisfactory method for this type of study.

These results give evidence of an effect of the rhizosphere on soil algae in the case of tea roots. The experiments have been repeated with other crop plants, both monocotyledons and dicotyledons, and have confirmed the presence of this effect. The results will be published in greater detail elsewhere.

The Field-Slug *Agriolimax reticulatus* as a Vector of the Lungworm *Cystocaulus ocreatus*

Gerichter[1] demonstrated that the land snail *Monacha syriaca* can act as a vector for the sheep lungworm *Cystocaulus ocreatus*. Development of the lungworm larvæ can take place in other species of land molluscs and also in some freshwater species[1,2]. The importance of most of these molluscs as vectors under field conditions does not, however, appear to have been investigated.

C. ocreatus was recorded only recently in British sheep[3]. Afterwards a study of the transmission of infection under natural conditions was commenced at Weybridge. Lungworm-free lambs were grazed with infected ewes and, at frequent intervals, fæcal samples from the lambs were examined for first-stage lungworm larvæ. After several weeks, larvæ were recovered from the fæces, and on autopsy of one lamb, adult worms were found in the lungs. Samples of the land molluscs inhabiting the pasture grazed by the sheep were collected and examined for lungworm larvæ. The only species infected was the field-slug *Agriolimax reticulatus*, so that it appeared that infection of the lambs had resulted from the ingestion of field-slugs. To verify that this was so, the feet from artificially infected slugs were fed to two stalled lambs reared free of lungworms. After several weeks, first-stage larvæ of *C. ocreatus* were recovered from both lambs.

A. reticulatus was by far the most numerous of the mollusc species collected from the Weybridge pasture, specimens being found throughout the year. According to Ellis[4], the field-slug is the commonest and most ubiquitous of the land molluscs found in Britain, inhabiting every possible situation. As *A. reticulatus* is almost certain to be found wherever sheep can graze, it is most likely that it is of considerable importance as a vector of *C. ocreatus* in Britain.

The Pituitary of *Myxine glutinosa*

The Myxinoids are possibly the most primitive living vertebrates, and the pituitary of *Myxine glutinosa* has hitherto[1-3] been described as having a separate infundibulum and adenohypophysis, a condition which has been regarded as primitive or degenerate. Furthermore, the adenohypophysis which lies embedded as groups of cells in connective tissue, has been described as being composed solely of chromophobes, and having no cytological or histological differentiation. Recent observations, however, have shown that the connective tissue septum does not separate completely the two parts of the pituitary but that the posterior end of the infundibulum comes into intimate contact with the adenohypophysis (Fig. 1). Also, the adenohypophysis is cytologically differentiated.

An examination of the infundibulum using Bodian's stain indicated that nerve fibres lie between and beneath the ependymal cells and posteriorly are closely apposed to adenohypophysial cells. Using several methods to demonstrate neurosecretory material this was shown to be present in the infundibular canal particularly where it narrows posteriorly.

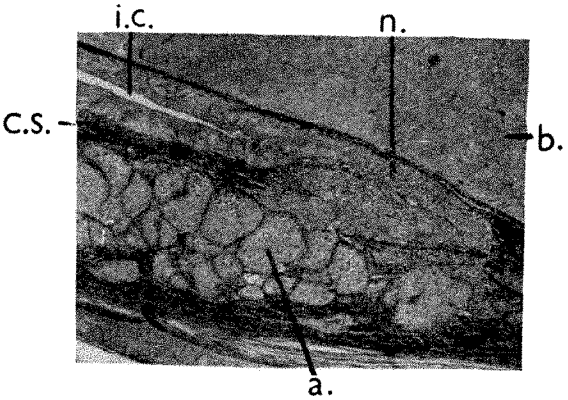

Fig. 1. Longitudinal section of the caudal end of the pituitary of *Myxine glutinosa* showing apposition of neurohypophysis and adenohypophysis. *a*, Adenohypophysis; *b*, brain; *c.s.*, connective tissue septum; *i.c.*, infundibular canal; *n*, neurohypophysis

Neurosecretion was also present in the region of the neurones lying outside the infundibulum. In the caudal part of what now must be regarded as a neurohypophysis a few cells identical with the ependymal cells are found separate from the lining of the ventricle. No neurosecretory material was found in the adenohypophysial region.

The adenohypophysis when stained with Heidenhain's azan stain or Mallory's triple stain was shown to contain at least two different types of basophils in addition to chromophobes and large vacuolated cells.

Furthermore, basophilic and periodic acid–Schiff positive colloidal aggregations occur in some adenohypophysial follicles as do epithelium-lined cavities. No distinct acidophils were observed. After applying the periodic acid–Schiff it was shown that the basophils contained periodic acid–Schiff positive material as in higher vertebrates. Some cells also stained after applying the Gomori aldehyde–fuchsin technique. It seems highly probable then that the pituitary of *Myxine* secretes carbohydrate-containing hormones in a similar manner to other vertebrates.

These observations, which will be reported in full elsewhere, indicate that the pituitary of *Myxine glutinosa* is possibly the simplest form of vertebrate pituitary and is a form which is not degenerate but is one in which the adenohypophysis has not become histologically differentiated.

Swimming in Spider Crabs of the Genus *Macropodia*

The only adult Brachyura which have previously been recorded swimming are the Portunidae, which do so by rapid paddling of the last pair of peræopods. These are adapted for swimming by having the distal segments flattened, with the edges densely fringed with hairs.

Swimming has now also been observed in *Macropodia rostrata* (L.) and *Macropodia longirostris* (Fabricius), members of the Maiidae (spider crabs). Both these species occur sublittorally in the Isle of Man. The genus has very long legs which bear a number of long hairs, and swimming involves the four pairs of walking legs and the chelæ. All the limbs beat at the same rate, but not in phase, and are kept continually moving. At the start of the stroke they are raised in the flexed position, and are extended for the more rapid downbeat. Swimming may reach a speed of 5 cm. per sec. in a specimen of *Macropodia rostrata* with a carapace-length of 13 mm.

The pattern of movement of the legs has been followed, and it is the same in both species. The chelæ and walking legs will be referred to as *c*, 1, 2, 3, 4 respectively, on the right (R) and left (L) sides.

The swimming limbs can be divided into three groups: (1) L^2 and R^2 beat in phase with each other, but out of phase with all the other legs; that is, when group 1 is beating down, groups 2 and 3 are on the up-beat. (2) R^c, R^1, L^3 and L^4 beat as a unit, with L^4 slightly after the rest. (3) L^c, L^1, R^3 and R^4 also beat as a unit, with R^4 just behind the others. One of groups 2 and 3 starts to beat slightly before the other, and either may take the lead during a period of swimming. The rate of beating varies from once to twice per sec. The body of the crab is horizontal during swimming, and the sequence of movement of the legs prevents rolling or pitching. This is because the legs beating down at any moment are symmetrically arranged around the centre of gravity of the crab (for example, L^2 opposite R^2, and R^c and R^1 opposite L^3 and L^4).

In the laboratory, swimming may occur apparently spontaneously, as a result of attack by another crab, or on repeated disturbance. It occurs more readily in smaller specimens, and large ones can seldom be induced to swim.

Port Erin, Isle of Man.

A New Cercaria of the Subfamily Gymnophallinae (Trematoda: Digenea) developing in a unique 'Parthenita' in *Littorina saxatilis* (Olivi)

A 'parthenita' containing furcocerous and tailless stages of a gymnophalline cercaria was found in the hæmolymph spaces of the digestive gland, gonad and gonoduct of the gastropod *Littorina saxatilis*. The unique feature of this 'parthenita' is that it has the same essential structure as the cercariæ which it produces. It is not yet possible to decide whether this 'parthenita' is, in fact, a cercaria possessing the kind of multiplication more usually associated with a redia or sporocyst; or whether it is a sporocyst or redia with a structure similar to a cercaria. Until this is decided the word 'parthenita' will be used here to indicate an analogy with the more usual redia or sporocyst found in digenetic trematodes.

This is the first record of a gymnophalline cercaria developing in a gastropod mollusc; previous records having been recorded from lamellibranchs. A detailed account of the information available to date on this species is being prepared for publication.

The 'parthenita' was found in 490 of 14,000 specimens of *Littorina saxatilis* examined between September 1958 and September 1959 at Aberystwyth and in 59 of 1,100 snails in August 1959 at Plymouth. Infection was almost exclusively confined to small molluscs, measuring from 0·6 to 5·0 mm. in length, occurring in the supralittoral zone; in favourable circumstances up to 40 per cent infection exists.

The fully formed 'parthenita' (Fig. 1) is spherical in shape, measuring 0·2–1·2 mm. in diameter and containing 20–2,000 tailless cercariæ. 5–70 fully formed 'parthenitæ' may occur in any one host. The whole surface of the 'parthenita' is covered with alternating rows of large backwardly directed spines. An oral sucker is present and specimens measuring less than 0·2 mm. in diameter have, also, a ventral sucker. The bifurcated alimentary canal consists of pharynx, œsophagus and two dilated cæca which are connected to the body-wall of the 'parthenita' by strands of tissue. There is no birth pore. The excretory system is best seen in specimens less than 0·3 mm. in diameter; in larger specimens the arrangement becomes difficult to observe. The translucent excretory vesicle is Y-shaped, the arms of the Y extending forwards as far as the posterior border of

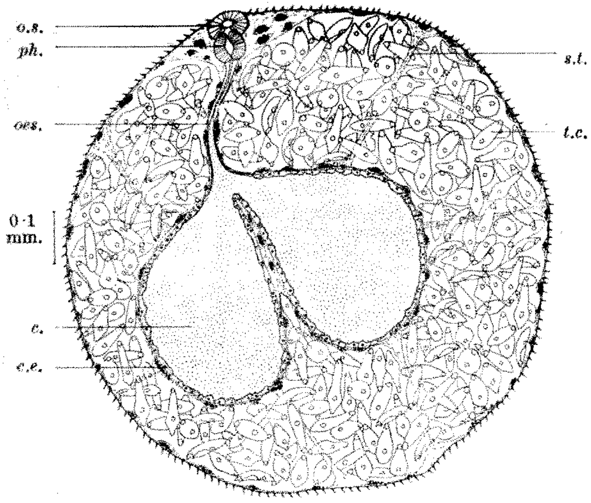

Fig. 1. A fully formed 'parthenita' containing tailless gymnophalline cercariæ from *Littorina saxatilis*. *c*, Cæcum ; *c.e.*, ciliated epithelial cells of cæcum ; *oes.*, œsophagus ; *o.s.*, oral sucker ; *ph.*, pharynx ; *s.t.*, tissue strand supporting cæcum ; *t.c.*, tailless cercaria

the pharynx, curving inwards as they do so. The flame cell formula is 2((2 + 2) + (2)) = 12. The 'parthenita', therefore, closely resembles a tailless gymnophalline cercaria.

Many 'parthenitæ' have been examined, and from these it has been possible to construct a series in development terminating in the formation of the fully formed 'parthenita' containing tailless cercariæ.

The earliest stage so far discovered is the mother 'parthenita', several generations of which may occur. The mother 'parthenita' measures 0·16–0·4 mm. in diameter and has all the anatomical features of the fully formed 'parthenita' except that it contains 5–12 developing 'parthenitæ' instead of cercariæ.

The contained 'parthenitæ' undergo a most unusual development, passing through a furcocercous stage similar in size and structure to the furcocercous cercariæ, which later develop into tailless cercariæ in the fully formed 'parthenita'. Unlike the furcocercous cercariæ, however, the tails are spineless and immobile ; these furcocercous stages cannot swim when released artificially. During the course of further development the tail of each furcocercous stage degenerates and a cavity containing germinal balls is formed in the body. This results in the formation of a number of contractile tailless 'parthenitæ' with the characteristic features of a tailless gymnophalline cercaria but possessing, also, a cavity filled with germinal balls. These 'parthenitæ' increase in size and the pressure so produced causes the wall of the mother 'parthenita' to burst, releasing all the 'parthenitæ', which are by this time at a similar stage in development. The body of the liberated 'parthenita' measures 0·12–0·4 mm. in length, depending on the state of contraction. It is extremely mobile ; moving through the hæmolymph spaces of the host by alternate attachment of oral and ventral suckers. The 'parthenitæ' gradually develop into immobile spheres measuring up to 1·2 mm. in diameter ; the ventral sucker degenerates in specimens more than 0·2 mm. in diameter. This is the stage already described as the fully formed 'parthenita' containing the tailless cercariæ.

The development of the cercaria within the 'parthenita' shows a fundamental similarity to the development of the 'parthenita' itself. On release from the mother 'parthenita' the 'parthenita' contains a number of germinal balls. These first develop into furcocercous cercariæ with opaque mobile bodies measuring 0·12 mm. in length ; the tail stem measures 0·042 mm. in length and the furcæ 0·043 mm. Both the body and the tail are covered with alternating rows of small spines. No eyespots or penetration glands are present. The excretory vesicle is Y-shaped and the flame cell formula is 2((1) + (1)) = 4. If released artificially the furcocerous cercaria swims by lashing its tail but it survives only for a short time in these circumstances. While still inside the 'parthenita' the tails degenerate and extremely contractile transparent tailless cercariæ result. The following characters of these tailless cercariæ demonstrate how they differ from all previously described gymnophalline tailless cercariæ and metacercariæ ; they indicate, also, how closely the tailless cercariæ resemble the 'parthenita' which produces them. They are extremely small, the body measuring 0·05–0·14 mm. in length according to the degree of contraction. Alternating rows of spines cover the whole body except for a region on the ventral surface between the oral and ventral suckers. The suckers are subequal. Three pairs of penetration glands are present, the posterior border of the largest reaching as far as the bifurcation of the gut. The arms of the translucent Y-shaped excretory vesicle are unbranched and extend forward as far as the posterior border of the pharynx, converging on it as they do so. The flame cell formula is 2((2 + 2) + (2)) = 12. Rudiments of the genitalia lie behind the ventral sucker.

The formation of the tailless cercariæ within the fully formed 'parthenita' probably terminates the cycle of development in the molluscan host, the tailless stage being infective to the definitive host.

All previously recorded gymnophalline cercariæ develop in sporocysts in lamellibranchs. The metacercariæ, also, occur in lamellibranchs, with two exceptions which have been recorded from gastropods. Since the 'parthenita' and cercaria described here are almost identical in structure and development it is possible that this is a case in which the type of multiplication that usually occurs in the sporocyst has extended into the cercaria. In other words the germinal cells in the cercaria, instead of giving rise to the reproductive organs of the adult, remain germinal and continue to multiply by polyembryony with the result that the cercaria in effect becomes a parthenita. If this life-cycle includes, also, a more 'normal' sporocyst not yet found and preceding the above described 'parthenita' then this may be the case, the life-cycle then being a modification of that normally found in the Gymnophallinae. If, on the other hand, no such sporocyst or its equivalent is present then the life-cycle might be more primitive than that of any other known digenean, the 'parthenita' indicating how multiplication in the molluscan host could have developed from an adult. Speculations, however, are unwise until the entire life-cycle of this form is known. Attempts at solving the life-cycle experimentally are in progress.

Forecasting the Annual Yield in Sea Fisheries

It is well known that the annual yield of the sea fisheries varies very much from year to year. An example of such variation is shown in Fig. 1 in which the broken curve shows the number (in millions) of skrei—spawning cod (*Gadus callarias*)—caught in the Lofoten fishing area of northern Norway in the years 1885–1958. It is obvious that such fluctuations make the planning of the fishing industry very difficult and that reliable forecasts would be helpful, even if they are only rough approximations.

In an earlier paper[1] I made the suggestion that it might be possible to compute yield forecasts by means of an aggregate of sine functions, using the periodic or period-like components found in series of measurements of the width of the annual growth zones in forest trees. The underlying idea was that the width of the growth zones and the size (in number) of the year-classes of fish populations might be determined by common factors. A rough outline of a theory was given.

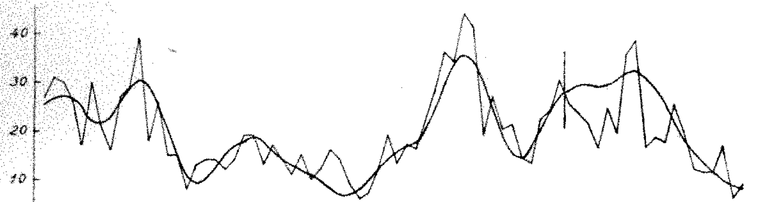

Fig. 1

Hjort[2] succeeded in showing that there are great fluctuations in the size of the year-classes in fish populations and concluded that these fluctuations were the main cause of the fluctuations in the yield. But fluctuations in the yield are also caused by other factors, such as weather conditions and altered fishing technique. Therefore, a successful forecast of the relative size of the stock of fish may not be a successful forecast of the yield; but it might show an approximately correct trend.

In 1939 I became acquainted with the results of the analyses of some series of measurements of the width of the growth zones of the Scots pine (*Pinus silvestris* L.) found by Ording[3]. His samples were taken in a forest in the neighbourhood of the Lofoten fishing area. Then, in order to verify my idea I fitted the series of annual yields of the skrei fisheries in the years 1885–1939 by a function constructed by means of four components (substituted by sine functions) found by Ording. The lengths of these components were 11, 17·5, 23 and 57 years. Also the phases of the components were taken from the results obtained by Ording. The actual yields were used merely for the computations by the least-square method of the weights of the components. The result, as well as the method of computation, is described in ref. 1. Later on I also included the 8·5 years component. The result so obtained is given by the smooth curve for the years 1885–1939 in Fig. 1.

Since this curve is constructed by means of an aggregate of sine functions, it can be extended to future years and might be used as a forecast of the annual yields. Actually, it is intended to be a forecast of the relative size of the stock of skrei. The thin curve 1940–58 shows the actual yields and the thick curve the 1939 forecasts for the same years.

It is evident that differences of the same magnitude as those observed in the years 1885–1939 should be expected. The largest differences between actual yield and forecast are found for the war years 1941–45 and in the years 1948–49. In the fishery reports from the Lofoten area I have found nothing which shows conclusively that the fishing was hampered by the war. But, bearing in mind the changes in the general conditions brought about by the war, I think we can assume that this was in fact the case. In 1948 and 1949 the weather conditions were uncommonly unfavourable. Bearing this in mind, the following conclusions seem to be justified: (1) That the width of the growth-zones of the pine and the size of the year-classes of the skrei are determined by the same main factors. (2) That it is possible to compute reliable forecasts of the yield of fisheries by means of the components found in series of measurements of the width of the growth-zones of the pine.

There is no doubt that the technique of forecasting can be improved. But in order to make improvements possible, it is necessary to sample new series of measurements of the width of growth-zones in forest trees and try to get better estimates of the lengths and the phases of the more important components.

The same method might prove to give satisfactory forecasts in other fisheries, too. However, the fishing technique used in the Lofoten area is very conservative, so that it can be assumed that the yield is a fairly constant percentage of the stock of fish. In other fisheries this may not be so. It is obvious that, for example, the introduction of a new technique may cause disturbances which are difficult to overcome.

I am very much indebted to Gunnar Rollefsen, director of the Norwegian Sea Fishery Investigations, for supplying me with data.

ANATOMY

Fine Innervation of the Carotid Body of the Rhesus Monkey

Although first mentioned in 1744[1], the first clear and accurate description of the carotid body was not published until 1862[2]. However, modern knowledge of the structure of this organ dates from 1926[3]. Since that time detailed macroscopic and microscopic studies of the structures found in the carotid bifurcation have been made on many different animal species. But in the Anthropoidea, except for the work of Sato[4], only macroscopic studies of this region have so far been undertaken (1852[5], 1899[6], 1928[7], 1932[8], 1935[9,10]). Sato's work is concerned only with the general histology of the organ and not its detailed innervation.

This is a preliminary report of part of an investigation into the histology and cytology of the carotid body and carotid sinus of *Macaccus rhesus*.

Rhesus monkeys were anæsthetized and then perfused through the heart first with warm normal saline to wash out the blood, and then either with 10 per cent formal–saline or Bouin's fixative.

The carotid bifurcation and adjacent tissues and structures were carefully dissected out and either treated : (1) according to the Bielschowsky method for pieces with pyridine treatment[11], or (2) 7μ serial wax sections were subjected to Bodian's silver protargol method using silver proteinate obtained from Roque's Laboratory, Paris[12].

With both techniques, the only glomus cells found to be innervated were the chief cells (De Kock's Type 1 cells[13]). Many fine nerve fibres wind round the large individual chief cells, or groups of chief cells, either in a regular manner (Fig. 1) or to form a tangled meshwork (Fig. 2). The fine nerve fibres appear to be in direct contact with the chief cells with no interposed interstitial cells[13–15]. No evidence was found of De Castro's "menisque terminaux"[16] within the cytoplasm of the cells.

The fine nerve terminals are of the order of 0·2–0·5μ in size. They fuse with each other to form larger fibres (Fig. 3) which run between the glomeruli of chief cells, and, joining other large fibres, emerge from the carotid body to form its contribution to the sinus nerve.

No evidence was found to support the observation[17] that the heavily medullated fibres of the sinus nerve, which most authorities consider as innervating both carotid body and sinus, do not take part in the innervation of the carotid body but are merely passing through on their way to the carotid sinus.

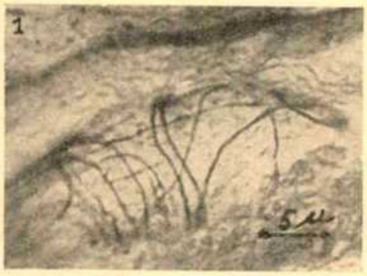

Fig. 1. A group of glomus cells showing the fairly regular arrangement of their innervating nerve fibres

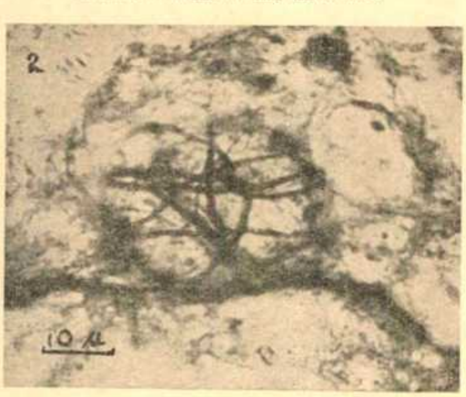

Fig. 2. Glomus cells enclosed in a tangled meshwork of nerve fibres

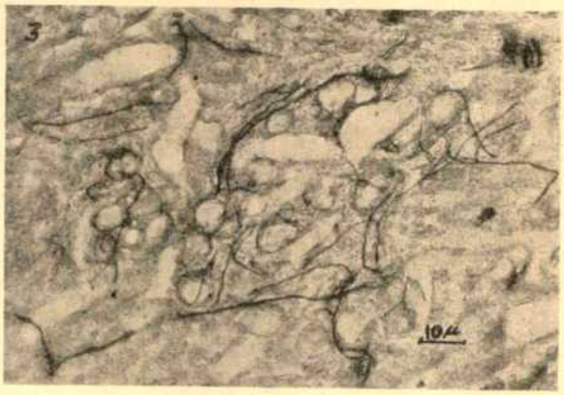

Fig. 3. Part of the carotid body showing the large globular glomus cells, sinusoids, and large nerve fibres running between the glomeruli

One of the difficulties encountered in this study was that the smallest nerve fibres are very near in size to the limits of resolution of the light microscope. However, further support for these observations that : (1) only the Type I glomus cells are directly innervated by the glossopharyngeal fibres without the intervention of interstitial cells, and (2) that no evidence could be found for an innervation of De Kock's Type II cells, comes from the recently made electron microscope studies on the carotid body of the cat by Garner and Duncan[18].

HÆMATOLOGY

Some Red-Cell Antigens of *Bison bonasus* as compared to Red-Cell Antigens of Domestic Cattle

RED cells of a bison (*Bison bonasus*) were submitted to serological examination in order to find antigenic similarity and differences between the erythrocytes of bison and those of domestic cattle. The blood groups phenotype of the individual in study was as follows :

$$A - A', E'_1 - W, X_2 - F - J - L$$

(The phenotype was determined using 38 bovine blood-typing reagents :

A ; B, G, I, E_1, E_2, O_1, O_3, Q, T_1, Y, A′, D′, E'_1, E'_3, J′, I′, K′ ; C_1, C_2, X_1, X_2, X_3, W, L′ ; F, V ; J ; L ; M ; S_1, S_2, U_1, U_2, U′ ; Z, ZZ ; Z′.

These reagents were kindly given to us by the Department of Genetics, University of Wisconsin, and by the Institute of Animal Breeding, Royal Agricultural College, Uppsala.)

The red cells of the bison studied were injected into seven rabbits and two heads of cattle (twins). The blood group phenotypes of the immunized animals were as follows :

No. 20/57 – I, Y, E'_3, K′ – C_2, X_3 – F – S_2
No. 21/57 – I, Y, E'_3, K′ – X_3 – F

(For determination of these phenotypes 19 standard reagents—A ; B, G, I, Y, K′ ; C_2X_2, L′ ; F, V ; J ; L ; S_1, S_2, U_1, U_2 ; Z—were used.)

After one series of immunizations (10 injections into each rabbit and three injections into each of the cattle) the animals were bled. The rabbit-immune sera reacted in high titres with both bison and cattle red cells (Table 1). The two cattle-immune sera exhibited the lytic titres of 1 : 64 and 1 : 16 against the bison red cells. These sera contained also antibodies for some samples of cattle red cells.

Table 1. Results of the Agglutination and Lysis Tests, using Unabsorbed and Absorbed Rabbit Anti-bison Red-Cell Sera with Bison and Cattle Red Cells

Serum		Titres of red cells -			
		Bison		Cattle	
		Agglutination	Lysis	Agglutination	Lysis
No. 7272	Unabsorbed	2,048	4,096	0	1,024
	Absorbed	32	64	0	0
No. 7144	Unabsorbed	2,048	2,048	0	512
	Absorbed	16	16	0	0
Pooled serum of all 7 rabbits	Unabsorbed	8,192	8,192	0	1,024
	Absorbed	64	128	0	0

Serum No. 20/57 reacted with 20 of the 110 tested cattle red-cell samples ; serum No. 21/57 reacted with 45 of the 109 tested samples. The specificity of these antibodies could not be identified with any of the 38 standard reagents ; more detailed studies on this problem are in progress.

In order to test whether the bison red cells bear antigenic substances particular only to this species, the rabbit anti-bison red cell immune sera were submitted to absorption with cattle red cells. It was assumed that this absorption would remove antibodies for those bison antigens which are identical or very similar to some of the cattle red-cell antigens.

The 10 samples of the cattle red cells employed in the absorption contained all known antigens except the antigens : H, I, P, E_2 and Z'. In the given case, only the absence of H and P antigens was of consequence. The remaining antigens, that is, I, E_2 and Z', were not present in the bison blood sample, and therefore there was no possibility that any antibodies could be formed against these antigens.

The rabbit anti-bison red-cell sera absorbed with cattle red cells gave a negative reaction with each of the 48 cattle red-cell samples, whereas they gave a clearly positive reaction with the red cells of the bison, and what is more, even in rather high dilutions. These results are presented in Table 1.

Despite the fact that these tests require further development and repetition on a wider range of specimens, our results allow us to conclude that :

(1) The erythrocytes of bison blood contain the antigens : A of system A, $A'E'_1$ of system B, WX_2 of system C, F of system FV, J^{sc} of system J, L of system L. They are all either identical or very similar to the antigens present in the domestic cattle.

(2) The red cells of the tested bison contain other, still unidentified antigenic factor(s) which may perhaps be found also in some of the cattle red-cell samples; these factors are antigenic to those individuals of cattle which do not contain them.

(3) The red cells of the tested bison contain one or more antigenic properties specific for them, which were not found in the cattle red-cell samples studied

Haptoglobin Types in South-East Asia

The discovery that the haptoglobin present in human serum can be resolved into a number of different types by electrophoresis in starch gel[1] and the subsequent demonstration that these types are controlled genetically[2] has opened a new field of investigation in human population genetics. Already the distribution of the haptoglobin phenotypes has been reported for a number of different populations in the world[3], and several other investigations privately reported to us are in progress.

The present study covers the distribution of the haptoglobin types among the three major ethnic groups in Malaya. Blood samples were obtained by venepuncture from healthy adults. In Perlis the samples were collected into Bayer 'venules' and sent to Perth as clotted blood : in Kuala Lumpur the samples were collected into syringes, and the serum was separated from the clot before being sent to Perth. In both cases the samples were flown in ice-cold containers and were generally in Perth within 48 hr. from the time of collection.

During the early part of the investigation electrophoresis was carried out in horizontal trays according to the original method of Smithies[4], using the hydrolysed starch supplied by the Connaught Medical Research Laboratories and borate buffer. Hæmoglobin was added to the samples prior to electrophoresis to give a concentration of approx-

Table 1 Number of Persons by Haptoglobin Type in various South-East Asian Populations

	Chinese	1	9	36	0	55	101
	Indians	3	2	13	0	69	87
Perth (students)	Chinese	1	9	21	—	35	66

Table 2

Ethnic group	No. tested	Distribution (per cent)					Gene frequency		$\chi^2(1)$	P
		0–0	1–1	2–1	2–1 (mod.)	2–2	Hp^1	Hp^2		
Malays	236	0·8	5·1	35·6	0·4	58·1	0·24	0·76	0·2	0·7–0·5
Chinese	167	1·2	10·8	34·1	—	53·9	0·28	0·72	3·58	0·1–0·05
Indians	219	1·8	1·8	13·7	0·9	81·7	0·09	0·91	0·70	0·5–0·3

imately 100 mgm. hæmoglobin/100 ml. of serum. The haptoglobin bands were rendered visible by means of a benzidine reagent. In the latter part of the investigation electrophoresis was carried out in vertical trays[5], the other conditions remaining the same.

Table 1 records the haptoglobin types for the Perlis and Kuala Lumpur samples together with a smaller number of samples collected from Asian students in Perth. There is no significant heterogeneity for any of the ethnic groups with respect to the place from which the samples came. For the calculation of gene frequencies the samples have been combined and the 0–0 and *Hp* 2–1 (mod) phenotypes excluded from the calculation.

Several points of interest arise when the present results, as shown in Table 2, are compared with those reported for other populations. In this material the modified *Hp* 2–1 phenotype[6] is rare, and no cases were noted among the Chinese, only two cases in Indians, and a single case in Malays. Similarly, individuals completely lacking haptoglobin (*Hp* 0–0) are infrequent also, though more common than in a control population of Australian whites[7]. It is extremely difficult to distinguish the *Hp* 0–0 phenotype with certainty. In many cases the amount of haptoglobin present in *Hp* 2–2 individuals is so slight that it can readily escape detection. All cases where haptoglobin was missing were examined at least three times on successive days. But some of the *Hp* 0–0 individuals may still represent *Hp* 2–2 individuals with haptoglobin concentrations below the level necessary for detection. Other cases may be individuals temporarily lacking haptoglobin due to hæmolytic episodes in their past history[8].

It has been suggested that the *Hp* 0–0 phenotype may be due to a modifying gene at a separate locus[9], or alternatively represents the homozygous condition for the Hp^{2M} gene (Giblett, E. R., personal communications). We do not have family material which would help in the interpretation of this phenomenon, but in the latter case since the modified *Hp* 2–1 type is infrequent in our series it would suggest that the homozygous condition Hp^{2M}/Hp^{2M} should be rare in these three ethnic groups.

The chief point which emerges from the present study is the high frequency of the Hp^2 gene in this area, reaching its highest reported value in Indians. This result is in agreement with the value reported by Sutton for a group of Asiatic Indian students in North America[10]. Further studies on populations in the Near and Middle East and in central Asia will be necessary before a clear picture of the *Hp* gene distribution in Asia as a whole is obtained. We are extending our own investigations to cover the aboriginal populations in this area, and a survey of the variations in the *Tf* and *Gm* serum protein groups for all these populations in South-East Asia is at present in progress.

Our thanks are due to the Australian National Health and Medical Research Council and the Research Grants Committee of the University of Western Australia, for financial assistance, and to Dr. Eloise Giblett for a sample of a *Hp* 2–1 (mod) serum.

Retention of Potassium by Human Erythrocyte Ghosts

When ghosts prepared from human erythrocytes by lysis in water are washed in a saline medium, sodium and potassium ions are nearly uniformly distributed across the ghost membranes[1]. In attempting to prepare ghosts with higher potassium and lower sodium concentrations than those of a saline medium we have found that incubation at 37° C. enables them partially to retain potassium and keep out sodium during subsequent washings and incubation.

A hæmolysate of completely lysed human erythrocytes was made approximately isotonic with plasma by the addition of 3 *M* salt solution (5 parts potassium chloride and 1 part sodium chloride) to give final concentrations of 150 m*M* potassium chloride and 30 m*M* sodium chloride. The ghosts were washed three times at room temperature in a saline medium (0·17 *M* sodium chloride, 0·005 *M* potassium chloride, 0·01 *M* sodium phosphate, *p*H 7·4), this process taking about 30 min. The potassium concentration in the ghosts (hæmoglobin content about 10 per cent of original erythrocytes) was approximately three times that in the medium, and incubation of the hæmolysate at various temperatures and for different periods of time before the addition of 3 *M* salt solution made no difference. However, when the suspension was incubated for about 30 min. at 37° C in 150 m*M* potassium chloride after the addition of

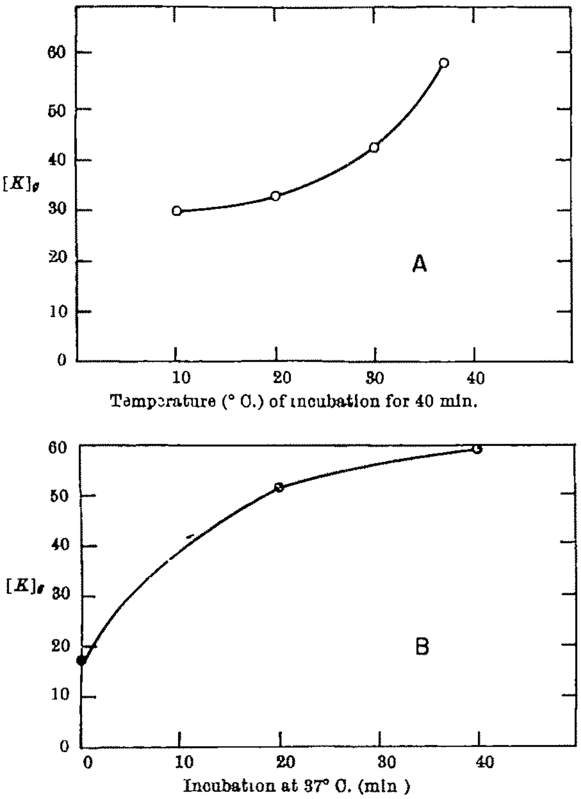

Fig. 1. The effect of incubation of a hæmolysate after the addition of 3 M salt solution to give 150 mM potassium chloride and 30 mM sodium chloride, at different temperatures for 40 min. (graph A), and at 37° C for varying periods of time (graph B), on the potassium concentration of red cell ghosts afterwards washed three times in physiological saline solution. $[K]_g$ has the unit. m.moles potassium/litre of ghosts

the 3 *M* salt solution, the washed ghosts then contained about twelve times more potassium than the medium. Both the temperature and the period of incubation affected the amount of potassium found in the washed ghosts (Fig. 1). The more potassium present the higher the temperature of incubation (range 10–37° C.), and ghosts incubated for 40 min. at 10° C. contained twice as much potassium as those unincubated at any temperature.

Ghosts spun down from a hæmolysate and then incubated in 0·17 *M* potassium chloride acquired a similar ability to retain potassium, showing that the non-particulate part of the hæmolysate was not required. The final potassium concentration of washed ghosts, however prepared, was never more than 50 per cent of the concentration in the suspension before washing. This may be because half the ghosts were equilibrated with the washing medium or because all the ghosts retained only half the maximum possible potassium, although these explanations are not exclusive. During the incubation of washed ghosts in the saline medium for 4 hr. at 37° C., about 5 m.moles potassium/l. ghosts/hr. were lost, which is about twice the rate of loss of potassium from fresh starved erythrocytes.

The results show that ghosts containing about 10 per cent of the hæmoglobin of erythrocytes may partially retain potassium during three washes and subsequent incubation in a saline medium, suggesting that after osmotic hæmolysis ghosts may regain some degree of the low permeability to potassium which is characteristic of erythrocytes.

Porphyrin Biosynthesis in the Leucocyte

THE presence, in various animal tissues not primarily hæmatopoietic, of some or all of the enzyme systems taking part in porphyrin and hæm biosynthesis has been reported by many authors. However, until recently, any investigation of porphyrin biosynthesis in the leucocyte has been hindered by the contamination of tissue preparations with erythrocytes having a much greater synthetic capacity. During a systematic study of several enzyme systems in the normal and pathological leucocyte now being carried out in this clinic, a method of preparing undamaged leucocytes, completely free of erythrocytes and thrombocytes, has been developed[1]. It therefore seemed interesting to study the behaviour of these enzyme systems in this readily available and easily quantitated tissue.

After incubation of a homogenate of normal human leucocytes with δ-amino-lævulinic acid under standard conditions (4 hr. at 37° C., *p*H 7·4, 0·8 × 10^7 leucocytes/400 μl.), a substance giving a red colour insoluble in chloroform on reaction with *p*-dimethylaminobenzaldehyde is found in the deproteinized supernatant. The absorption spectra of this colour and that formed by a solution of porphobilinogen in the incubation medium are exactly superposable between 450 and 600 mμ, with peaks at 522 and 555 mμ. No fluorescence is seen under Woods light and only a very slight peak between 400 and 410 mμ. After heating the deproteinized supernatant at 100° C., and *p*H 1–2, for ½ hr., a distinct red fluorescence is seen, together with the appearance of a peak at 407 mμ, indicating strongly that the Ehrlich reacting substance present was porphobilinogen, transformable to porphyrin. A quantitative analysis of these results will be published elsewhere.

It is interesting to note that leucocytes prepared from the blood of normal guinea pigs showed synthesis of porphyrin after 4 hr. incubation. Due to the small amounts no analysis or purification of any porphyrins formed has been attempted. The concentrations were roughly compared by comparison of the corrected absorption at the Soret peak, that is, of the deproteinized incubate supernatants.

Chromatography of the supernatant of an incubate of authentic porphobilinogen with normal leucocytes under standard conditions showed two spots, one corresponding to the porphobilinogen marker together with another, remaining near the origin and becoming blue on standing. Attempts at chromatography of the supernatant from an incubation with δ-amino-

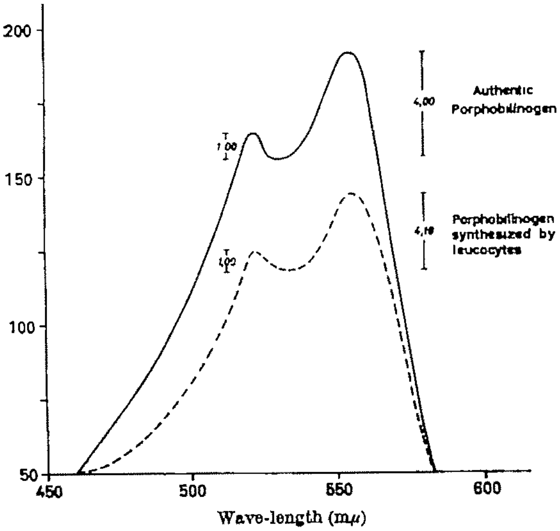

Fig. 1

lævulinic acid were not reliable due to the contamination of the minute quantities involved. However, while no typical porphobilinogen spot was seen, one remaining near the origin and turning blue on standing was present. Demonstration either that this spot is similar to the atypical spot on the porphobilinogen chromatograms or is only an artefact must wait until very much larger quantities are available.

If the incubation is continued, porphyrin fluorescence is seen in the supernatant after 24 hr., indicating that its absence earlier in the incubation could be a problem of the concentration of the different factors involved. However, incubation of a more concentrated homogenate, approx. 40×10^6 leucocytes/incubation, led to synthesis of proportionately greater quantities of porphobilinogen, always without the appearance of porphyrin. Incubation of authentic porphobilinogen in physiological quantity (6 mμM) with leucocytes under standard conditions leads to porphyrin formation apparently in excess of that in the control without leucocytes; but as this remains constant when either the concentration of porphobilinogen or of leucocytes is increased, the apparent difference is probably due to the method of estimation. It seems most likely that the presence of porphyrin after 24 hr. incubation is due to the spontaneous condensation of the porphobilinogen synthesized, and that the mature leucocyte, while able to form porphobilinogen, cannot carry the synthesis any further. There are two possible explanations of this: that porphobilinogen-deaminase is in fact absent, or that it is present but inhibited in some fashion.

That it is present and active in the immature cell is indicated by the results of incubation of leucocytes from certain cases of leukæmia. When the cell preparation contained a large proportion of young cells, either monoblasts, lymphoblasts or myeloblasts, there was net synthesis of porphyrin after incubation with δ-amino-lævulinic acid under standard conditions. It is possible that, on maturation of the leucocyte, a system which slightly transforms porphobilinogen so that it cannot be utilized by porphobilinogen-deaminase may come into play.

It is also interesting to note that in two cases, one of acute myeloid and one of acute lymphatic leukæmia where the cells contained little or no protoplasm, there was no synthesis of either porphobilinogen or porphyrin from δ-amino-lævulinic acid, demonstrating that these enzymes are probably exclusively present in the cytoplasm.

We wish to thank Prof. C. Rimington for his advice on our chromatograms

Hæmolytic Disease of the Newborn probably due to Anti-f

A case is briefly presented, the chief feature of which is the production of anti-f held to be responsible for severe hæmolytic disease of the newborn. Prior to her marriage the patient, Mrs. M. H., group O, Rh positive, most likely genotype R^1R^1 (DCe/DCe), was transfused with Rh positive blood of unknown genotype. The first pregnancy ended in a full-term stillbirth but no autopsy was performed. The second pregnancy also terminated in a full-term stillborn due to hydrops. During this second delivery the patient received 500 c.c. of group O, Rh negative blood followed by a severe hæmolytic reaction and renal shutdown. The patient recovered with the aid of an artificial kidney and received a total of 13 pints of blood—all compatible by an indirect Coombs cross-match.

The third infant delivered in 1958 by Cæsarean section at 38 weeks had severe hæmolytic disease and recovered after replacement transfusion with group O, Rh positive compatible blood.

The first blood specimen of Mrs. M. H. was submitted during August 1959 in the seventh month of her fourth pregnancy. Screening tests indicated that the serum contained an antibody which reacted with albumin-suspended cells. On testing the serum with a panel of cells it was observed that bloods R^1R^1(DCe/DCe), R^1R^2(DCe/DcE), $r'r'$(dCe/dCe) and r^yr^y(dCE/dCE) failed to react, while R^2R^2(DcE/DcE) gave either negative or very weak reactions. Cells of genotypes R^1r and rr and others having antigens c and e carried by the same chromosome in single or double dose reacted strongly. The failure of the serum to react with the 4 $r'r'$ and r^yr^y bloods excludes the presence of anti-d. These findings suggested the presence of a very weak anti-c but a predominating antibody, anti-f. In order to exclude a prozone indicative of a potent anti-c, the serum was titrated with R^2R^2 cells and this result confirmed the presence of a very weak anti-c. The titre of anti-f as determined by tests with rr bloods was 1 : 32. These findings were fully confirmed in tests of a second specimen of the patient's serum submitted later in the seventh month

Mrs. M. H. was delivered by Cæsarean section one month prior to the expected date of delivery and the baby was reported as normal at birth, but soon developed jaundice. The direct Coombs test of the cord blood was moderately positive. The infant

Column 1 indicates the reactions with albumin-suspended red cells after centrifugation; column 2 indicates the reactions with indirect antiglobulin test on the albumin-suspended red cells.

The anti-*f* and $r'r''$ bloods were supplied by courtesy of Dr. R. E. Rosenfield, Blood Bank, Mount Sinai Hospital, New York.

recovered following a replacement transfusion carried out with Rh positive blood, compatible with the mother's serum.

An eluate prepared from the cord red cells by the heat technique, revealed the presence of anti-f when tested with albumin-suspended cells followed by the indirect antiglobulin reaction. The results obtained in simultaneous tests of the maternal serum, cord serum and the eluate of the infant's coated red cells with a selected panel of test cells are given in Table 2.

Since the supply of maternal serum obtained at delivery was exhausted, the specimen taken at 7 months was compared with cord serum in parallel titrations with ficinated red cells. The results are given in Table 3.

Table 3

Test cell	Maternal serum	Cord serum	Test for
R^2R^2	1:4	1:4	anti-c
rr	1:16	1:32	anti-f

The titre for anti-c was less than the titre for anti-f, and this observation together with the findings of the cord cell eluates supports the view that anti-f induced the hæmolytic disease. This case is unique because the patient was expected to produce the more common anti-c and perhaps anti-f. Surprisingly, anti-c was very weak and a more potent and readily detectable anti-f was produced.

In the first example of anti-f, produced by a patient immunized by transfusions, there were additional antibodies (anti-N, anti-K and anti-S), but anti-f was the only Rh antibody produced[1,2]. Anti-f is frequently found as a secondary antibody in most anti-c and anti-e sera[3], but its demonstration is not a simple matter and requires absorption with selected cells and testing with enzyme-treated cells.

There is no apparent explanation as to why this mother who should have produced the more usual combination of a strong anti-c and perhaps some anti-f responded preferentially to the 'weaker' antigen. Studies show nothing unusual in the genotype of her husband's blood. His c antigen scored the same as other R^1r bloods. The antigenic stimulus in this case, however, was provided prior to her first pregnancy by transfusions of bloods which were probably f positive and during the delivery of the second stillbirth by Rh negative, and, therefore, f positive blood. There is in the literature at least one example of a patient immunized by pregnancy who produced the rare instead of the more common antibody[4]. In this case an Rh negative patient produced a more potent anti-C and a much weaker anti-D. Her husband was of the unusual genotype R^1r' (DCe/dCe) with suppression of D by gene interaction with the partner chromosome r' (dCe). We and others have also observed several examples of Rh negative women who produced anti-K or other antibodies and not anti-D even though their husbands were Rh positive.

We wish to thank Dr. Robert J. Collins, Snyder, New York, for submitting these specimens and supplying us with the case history.

PATHOLOGY

Auto-Antibody in Rats with *Plasmodium berghei*

IN human malaria it has long been recognized that total loss of blood is significantly more extensive than loss which can be attributed to the direct rupture of parasites emerging from infected erythrocytes[1]. In a comparative survey of loss of blood and replacement in plasmodial infections of other mammals and birds, excessive erythrocyte destruction of the same type has been observed in all except one of the host–parasite combinations studied to date, namely in rats with *Plasmodium berghei*[2] and *Plasmodium vinckei*[3], in rhesus monkeys with *Plasmodium cynomolgi*, *Plasmodium gonderi* and *Plasmodium knowlesi*[4], and in chickens with *Plasmodium lophurae* (Zuckerman, A., unpublished results).

In this survey excessive loss was particularly striking in infections with mild or negligible parasitæmia. In such cases the main anæmic bout generally follows peak parasitæmia by at least a few days, and usually occurs when parasitæmia has become microscopically negligible or even latent. Since direct rupture due to emerging parasites cannot but be negligible when parasitæmia is so low; and while during the same period up to a third or even more of the circulating red cells may rapidly be destroyed, the results clearly show that some agency other than direct parasitic rupture is engaged in destroying red cells.

A working hypothesis to explain this excessive loss was suggested in the earlier papers of the survey, namely, that red cells may be sufficiently altered by the presence of parasites to become antigenic, and that they may then give rise to the production of auto-antibody.

The host–parasite combination of *P. berghei* in the adult rat is a convenient one for demonstrating excessive loss of blood, since parasitæmia is low and loss of blood high. Excessive loss thus stands out clearly, and is not masked by loss due to the parasitic rupture of host cells.

Auto-antibody was sought in such rats with the aid of a modified Coombs's test using anti-rat-serum rabbit serum as antiserum. The antiserum, as well as normal control rabbit serum, was exposed to normal washed rat erythrocytes before use, to remove an anti-rat-cell agglutinin regularly present in rabbit serum.

Forty-nine Coombs's tests done in 14 infected rats were positive during the period following parasitic crisis, while Coombs's negatives were regularly obtained from the same rats before crisis. To date, no infected rat which survived until latency has failed to pass through an evanescent period during which its red cells were antibody-coated. In no case did agglutination of Coombs's positive red cells occur in the presence of normal adsorbed rabbit serum. Forty-five tests done with the blood of eight uninfected control rats exposed to normal or anti-rat-serum rabbit serum were all Coombs's negative.

Antibody coating of erythrocytes, negative before crisis and positive after crisis, wanes and finally disappears as blood counts return to normal. The period of antibody coating thus closely corresponds to that of excessive loss of blood. Since latency commences at about the same time, the overwhelming majority of the coated cells must have been uninfected rather than parasitized.

Removal of the antibody-coated cells from the circulation is thought to be the cause of the excessive anæmia.

Bilirubin was sought in the serum of four rats at the height of the anæmic bout, with negative results. Antibody coating at this time is therefore not likely to have led to intravascular hæmolysis. It is more likely that coated cells, being opsonized, are filtered out of the circulation by elements of the lymphoid–macrophage system. It is germane that unparasitized red cells, together with infected cells, are avidly taken up at and after crisis by macrophages of monkeys infected with *Plasmodium brasilianum*[5], *P. cynomolgi* and *P. knowlesi*[6]; and that chicken macrophages *in vitro*, in the presence of blood infected with *P. gallinaceum* or *P. lophurae* suspended in homologous hyper-immune serum, ingest both normal and infected cells[7].

The above experiments are compatible with the view that auto-antibody against their own uninfected red cells is formed in mature rats infected with *P. berghei*. The fact that excessive loss of blood similar to that in *P. berghei* rats has also been observed in a broad spectrum of plasmodial infections in hosts of widely varying phylogeny suggests that a similar process may prove to be a general feature of malarial pathology.

Anti-tumour Activities of Copper Chelates

CHELATING agents have been shown to interfere with the utilization of metals by micro-organisms, robbing cells of their necessary metals[1]. Retardation of growth of a tumour (sarcoma 37) by the administration of two chelating agents, dipyridyl and O-phenanthroline, was observed by Leiter *et al.*[2]. Now, α-ketoglutaric acid oxime has been found to form its copper, iron, or nickel chelate at the physiological *p*H, and its antitumour activity *in vitro* was observed by the stained cell count method[3].

The immediate injurious action of the oxime (100 mgm./ml.) on the selective permeability of Ehrlich carcinoma cells was shown to be increased by the formation of chelate compounds. The same action of the chelates, copper and iron-α-ketoglutaric acid oxime, was brought about by a concentration of 25 mgm./ml. calculated as the oxime. To show the clear antitumour activity, the hydrophilic groups of the chelating agent should be masked by the metal ion to form the chelate compound which will be more permeable through cell membranes including the lipoid layer[4].

Dimethylglyoxime did not exhibit antitumour activities at a dose of 50 mgm./kgm./day *in vivo*. But the oxime (3–6 mgm./kgm./day), a chelating agent, exhibited potential antitumour activities on Ehrlich carcinoma and Crocker sarcoma 180 in the presence of copper, and not in the co-existence of other metal ions, such as nickel, cobalt, zinc, iron, manganese, magnesium and mercury. If antitumour activity of the chelate compound is only due to that permeable nature, the dimethylglyoxime should also exhibit the activity in the existence of other metals. But the activity was only exhibited by the copper chelate compound.

Not all the copper chelates always exhibit antitumour activity. The ligand moiety may also take a significant part in the activity. If the activity be exhibited by the non-ionic molecule of the copper chelates, copper-biacetyl-monoxime should also exhibit antitumour activity.

Both copper-dimethylglyoxime and copper-biacetylmonoxime inhibited the dehydrogenase activity of Ehrlich carcinoma cells at the same concentration of 25 γ/ml. But the former destroyed the selective permeability of tumour cells at 25 γ/ml.; nevertheless in the case of the latter chelate more than 180 γ/ml. were required to cause such action. As has already been described, the former exhibited clear antitumour activity *in vivo*, while the latter did not. Both of them might permeate the cells to inhibit dehydrogenase activity, and only the former clearly inhibited tumour growth.

De Long *et al.*[5] observed a decreased calcium content which is peculiar to tumour tissues. Ambrose *et al.*[6] observed a marked difference of the electrophoretic motility between tumour and normal cells. As suggested by Brachet[4], if the increased motility of the cancer cells is to be attributed to different properties of the cell membrane, the antitumour substances, having specific inhibitory actions by breaking exclusively the selective permeability of cancer cells, may be formed. Some copper chelates having an adequate ligand moiety may exhibit the specific inhibitory action on tumour cells.

A full account of this work including the antitumour activities of the copper-dimethylglyoxime is to be published in the journal *Gann.*

'Phenergan' and Versene in Dietary Liver Necrosis

RATS fed on Himsworth's[1] necrogenic diet have livers that are histologically undamaged, except for mild fatty infiltration, until an episode of acute massive necrosis occurs. Schwarz *et al.*[2] reported that liver slices from animals fed a necrogenic diet showed a metabolic abnormality at times when the livers were still normal histologically. The abnormality consists of an inability of these slices to maintain oxygen uptake for more than about 30 min. when incubated in Ringer solution at 38° with oxygen.

In the present investigation acute massive liver necrosis overtook the weanling rats after about fourteen days of feeding the yeast diet (mean 17·5, *S.D.* 4·0). Slices were taken from rats without liver necrosis at times after the seventh day of feeding the diet. Oxygen uptake was measured by the Warburg technique with Ringer phosphate[3] solution with 1·2 m*M* calcium as the incubation medium. Respiration declined to 50 per cent of initial rates in 40–60 min. This decline was invariably and completely prevented over test periods of 150 min. by the addition of 10^{-4} *M* 'Phenergan' (10-(2-dimethyl amino-*iso*propyl)phenothiazine hydrochloride) or 10^{-3} *M* versene (sodium ethylenediamine tetraacetate) (Fig. 1).

The initial rate of oxygen uptake in Ringer solution was the same as the rate maintained by the protective additions, and was similar to the rate of oxygen uptake by slices from control rats fed the necrogenic diet plus α-tocopherol (which completely prevents necrosis).

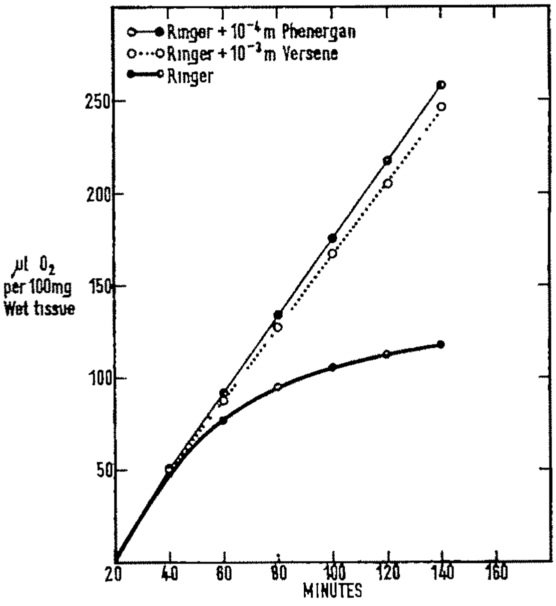

Fig. 1. Oxygen uptake of liver slices. Rat on yeast diet for 9 days

If 'Phenergan' is added to the yeast diet fed to the rats the onset of massive liver necrosis is delayed (Fig. 2).

The same effect is found if the two groups of rats are pair fed, and it is therefore not due to the decrease in food intake associated with the first days of feeding 'Phenergan'.

'Phenergan' has been found to prevent liver damage in thioacetamide poisoning[4]. A possible explanation for these effects in dietary liver necrosis is that both 'Phenergan' and versene act by blocking a chain of reactions where trauma leads to release of toxic breakdown products and further damage results. Such trauma would be provided by cutting the slices, or, *in vivo*, by absorption of toxic substances from the diet. Work is in progress to elucidate the nature of the biochemical lesion.

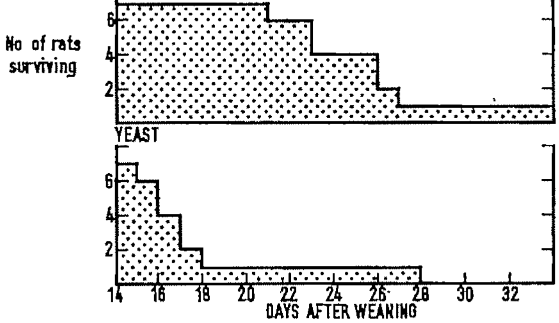

Fig. 2. 21 rats given yeast diet alone for 13 days from weaning. Then divided into three groups and fed yeast diet with or without 'Phenergan'

This work was done during the tenure of a Colonial Medical Research Scholarship.

RADIOBIOLOGY

Radioactive Fission Products in Lungs

We have made measurements on the radioactivity of lung tissue, which show that the amount of fission products at present deposited in lungs by inhalation is large enough to be detected by comparatively simple means. This seems of interest for studying retention of dust in the respiratory tract.

Gamma-scintillation spectra of dust samples collected and measured in Vienna since July 1958 have all shown three characteristic photo-peaks: at (1) 145 keV., (2) 490 keV. and (3) 750 keV. This is in agreement with observations at other locations on top soil[1], rain-water[2], etc. Fig. 1*a* gives the spectrum of one of the dust samples collected in Vienna by filtration of air. On the basis of known half-lives, decay schemes and fission yields, the peaks can be assigned to the following fission products: (1) cerium-141 and cerium-144, (2) ruthenium-103, (3) zirconium-95 + niobium-95. These assignments were confirmed in this laboratory by following the decay of the photo-peaks and by carrying out radiochemical separations. Using the peaks, the listed fission products present in atmospheric dust due to nuclear test explosions can be determined quantitatively by gamma-spectrometry.

Since dust particles are inhaled and some fraction of them is retained in the respiratory tract, we have attempted to detect fission products in lungs by gamma-spectrometry. Lungs from animals and humans were ashed and the gamma-spectrum of the ashes was measured using a well-type sodium iodide (thallium) crystal. The spectrum of the ashes of a human lung is shown in Fig. 1*b*. It is apparent that the fission products detected in dust by gamma-spectrometry are also present in lung tissue. From the spectra the contents of zirconium-95 + niobium-95 and of ruthenium-103 can be calculated. (Contents of radiocerium can also be calculated, but the values are thought to be less reliable and are therefore not listed.) The values obtained from our measurements are given in Table 1.

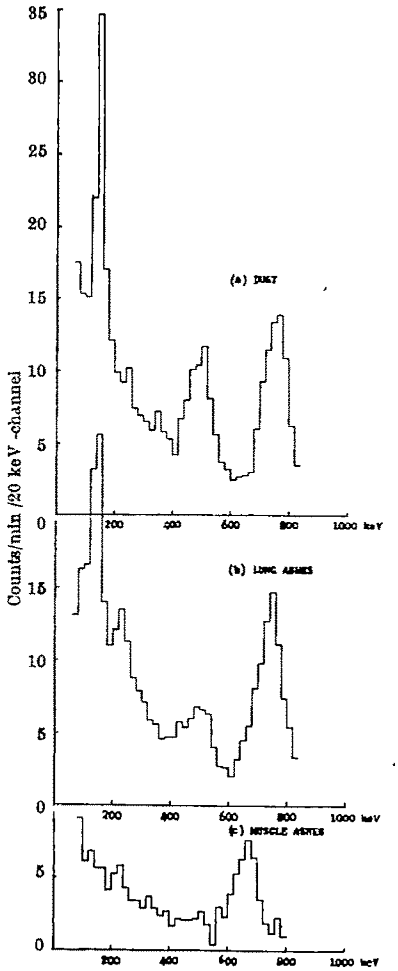

Fig. 1. Typical gamma-spectra (obtained with 20 keV.-channels, counting 16 min. in each channel; background subtracted) (*a*) Dust sample from 88 m.^{3} air (collected April 27, 1959; measured May 6, 1959). (*b*) Lung ashes from human *C* (measured May 26, 1959). (*c*) Muscle ashes from human *C* (measured May 27, 1959)

* Sample consisted of entire lung.
† Sample consisted of approximately half a lung.
‡ Age at death.
§ All radioactivity measurements were carried out within 5–10 days after death.
¶ Activity not detected or too small for quantitative evaluation.

Control measurements have been made on other organs (muscle, liver) from two of the humans from which lungs were obtained. The spectra of the muscle and liver ashes show only the presence of cæsium-137 (photo-peak at 662 keV.); the characteristic peaks found for dust and lung samples are not observed (Fig. 1c). (The peak due to the 1·46 MeV.-gamma radiation of potassium-40 was also observed, but is not shown in the diagram.) The potassium contents of the ashed lung and muscle tissues from one of the humans were determined by chemical analysis. From the potassium found in muscle ashes a value of the specific activity of cæsium-137 referred to potassium was obtained (84 μμc. cæsium-137 per gram potassium). (This value is somewhat higher than the range of values found by whole-body counting during 1956–57 (25–70 μμc. per gm. potassium, ref. 3) or early in 1958 (30–60 μμc. per gm. potassium, ref. 4).) Using this specific activity and the potassium content of the lung ashes it can be estimated that the activity of cæsium-137 in the lung amounts approximately to one-tenth only of the observed zirconium-95 + niobium-95 activity. This explains why cæsium-137 was not clearly detected in the spectra of lung ashes.

The amounts of radioelements found in lungs can be compared with the corresponding figures for air, as obtained from measurements on dust samples. During the past few months we have usually observed concentrations of fission products within the following ranges: 2·5–5·0 μμc. zirconium + niobium-95 per m.^{3} air and 0·8–1·6 μμc. ruthenium-103 per m.^{3} air. Thus, lungs of adult humans contain at the present time, by order of magnitude, as much fission products as a hundred cubic metres of air. It should also be noted that the activities of fission products found for the various lung samples (cow, sheep and human) agree fairly well if referred to one gram of lung tissue: for the activity of zirconium-95 + niobium-95 six values are within the range 0·39–0·54 μμc. per gram tissue and all eight values are within the range 0·27–0·74 μμc. per gram tissue; for the activity of ruthenium-103 five values are within the range 0·060–0·091 μμc. per gram tissue, and all eight values are within the range 0·04–0·14 μμc. per gram tissue.

The possibilities of using measurements of the type reported here for the study of dust retention and excretion will be discussed in a later detailed publication.

This investigation has been carried out as part of work done under a research contract with the International Atomic Energy Agency. Human lungs were put at our disposal by Prof. H. Hayek, Institute of Anatomy, University of Vienna. The dust samples were collected by Prof. J. A. Schedling, Mr. W. A. Müller and Mr. M. Sedlacek, First Physical Institute, University of Vienna.

Incorporation of Tritium-labelled Thymidine and Tritium-labelled Deoxycytidylic Acid into Deoxyribonucleic Acid after Irradiation of the Deoxyribonucleic Acid Primer with γ-Rays

RECENTLY, Kornberg *et al.*[1] have demonstrated that deoxyribonucleic acid formed *in vitro* by enzymatic synthesis has chemical and physical properties similar to the acid used as primer. Since exposure to radiation is known to cause chemical changes in deoxyribonucleic acid[2–4], it was thought that such changes might be reflected in the newly synthesized acid. In an attempt to study this, we have determined the ability of irradiated and non-irradiated deoxyribonucleic acid to incorporate tritium-labelled thymidine or tritium-labelled deoxycytidylic acid in the presence of the deoxyribonucleic acid-synthesizing enzyme system from regenerating rat liver.

Deoxyribonucleic acid isolated from calf thymus by the method of Kay *et al.*[5] was used in all experiments. An aqueous solution of the acid (0·4 per cent) was irradiated with various doses of γ-rays from a cobalt source at a rate of 4,000 roentgens/min. Irradiated as well as non-irradiated samples were then used as primers to study the incorporation of either labelled thymidine or labelled deoxycytidylic acid into deoxyribonucleic acid in the presence of the following compounds: deoxyadenylic acid, deoxyguanylic acid, deoxycytidylic acid, thymidine, adenosine triphosphate and the 'deoxyribonucleic acid-synthesizing enzyme system' prepared from regenerating rat liver. The assay procedure used was that of Bollum and Potter[6] except that the incubation time was 30 instead of 60 min.

The results of two series of experiments using two tritiated precursors of deoxyribonucleic acid and three radiation doses are shown in Table 1. Each value with standard deviation of the mean is based on quadruplicate or quintuplicate assays. It is apparent that the amount of labelled thymidine incorporated into deoxyribonucleic acid diminished as the radiation dose to the primer increased. In the case of labelled deoxycytidylic acid, however, the amount incorporated increased after irradiation of the deoxyribonucleic acid with 20,000 roentgens but decreased with higher doses to values approximating to those observed with non-irradiated deoxyribonucleic acid. Fig. 1 shows that the ratio of tritiated deoxycytidylic acid to thymidine incorporated into deoxyribonucleic acid was linearly related to the radiation dose under these conditions of study.

Base analysis of irradiated and non-irradiated deoxyribonucleic acid using Wyatt's paper chromatography method[7] showed that irradiation caused no significant change in the base ratio even after exposure to 200,000 roentgens. This indicates that other types of physico-chemical changes in the primer such as those involving hydrogen bonds must be responsible for our observations.

It is interesting to speculate that the changes in the capacity of irradiated deoxyribonucleic acid serving as a primer to incorporate tritiated thymidine and deoxycytidylic acid may be analogous to the altered ability of mutated genes to replicate themselves. A simple calculation serves to show that this hypothesis is not beyond the realm of possibility.

The following reasonable values can be used to calculate the mutation-rate of a gene in an irradiated living cell: (*a*) the molecular weight of deoxyribo-

Table 1. Incorporation of Tritium-labelled Thymidine and Deoxycytidylic Acid into Irradiated Deoxyribonucleic Acid

Group	Experiment 1 Radiation dose (roentgens) 0	 20,000	 240,000	Experiment 2 Radiation dose (roentgens) 0	 20,000	 120,000
Radioactivity* of tritium-labelled thymidine incorporated into deoxyribonucleic acid	159 ± 14	109 ± 15	9 ± 5	64 ± 8	48 ± 4	5 ± 1
Radioactivity* of tritium-labelled deoxycytidylic acid incorporated into deoxyribonucleic acid	41 ± 3	113 ± 25	55 ± 8	70 ± 9	113 ± 10	45 ± 6
Ratio† of incorporation of tritium-labelled deoxycytidylic acid to tritium-labelled thymidine into deoxyribonucleic acid	1·00	4 00	23 5	1 00	2 16	8·90

*Radioactivity is expressed by counts per min. per 100 μgm. of deoxyribonucleic acid.

$$\dagger\ \text{Ratio} = \frac{\left(\dfrac{\text{Radioactivity of tritium-labelled deoxycytidylic acid in irradiated deoxyribonucleic acid sample}}{\text{Radioactivity of tritium-labelled thymidine in irradiated deoxyribonucleic acid sample}}\right)}{\left(\dfrac{\text{Radioactivity of tritium-labelled deoxycytidylic acid in non-irradiated deoxyribonucleic acid sample}}{\text{Radioactivity of tritium-labelled thymidine in non-irradiated deoxyribonucleic acid sample}}\right)}$$

nucleic acid is 6×10^6 (ref. 8); (*b*) one molecule of deoxyribonucleic acid contains 2×10^4 nucleotides, each of molecular weight 300; (*c*) the size of the nucleus is 5×10^{-11} cm.^{3} (ref. 9); (*d*) the deoxyribonucleic acid content per cell is 5×10^{-12} gm. (ref. 10). Assuming that one molecule of deoxyribonucleic acid corresponds to a gene, the mutation-rate in the irradiated cell would be $5{\cdot}8 \times 10^{-5}$ G per roentgen per nucleus per gene, where G equals the number of molecules affected per 100 eV. of energy absorbed. In the experiments reported in this communication, the above-mentioned ratio of 3 : 1 for the tritiated deoxycytidylic acid and thymidine incorporated into deoxyribonucleic acid irradiated with 20,000 roentgens can be used to calculate the G values of this system. This turns out to be 44, provided all nucleotides are equally important in the synthesis of deoxyribonucleic acid.

Substituting this value for G in the expression given above, the rate of molecular alteration of the irradiated deoxyribonucleic acid primer (which could be thought of as analogous to the mutation-rate in a gene) is $2{\cdot}7 \times 10^{-3}$ per roentgen per nucleus per deoxyribonucleic acid molecule. This value is much higher than the mutation-rate of 10^{-4} or 10^{-5} per gene observed in Nature. However, in other studies of irradiated deoxyribonucleic acid such as those involving its transforming activity[11], it has been shown that only one-tenth of the molecule is responsible for the activity. If the primer has a comparably small active site, the rate of alteration of irradiated deoxyribonucleic acid per roentgen would be reduced considerably. When irradiated *in vivo*, protection of deoxyribonucleic acid by other nuclear constituents would also help to reduce the difference between the rates noted in the genes of living cells and those noted under the conditions of our experiments.

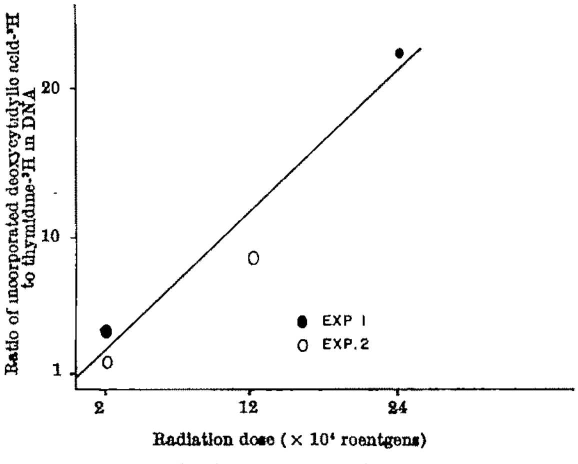

Fig. 1. Changes of ratio of tritium-labelled deoxycytidylic acid to tritium-labelled thymidine incorporated into deoxyribonucleic acid primer irradiated with various doses of radiation. The ratio defined in Table 1 has been used

Further studies on the replicating ability of irradiated deoxyribonucleic acid will be reported elsewhere.

This work was supported, in part, by a grant from the United States Atomic Energy Commission.

ARCHÆOLOGY

Spectrographic Analysis of Romano-British Pottery

Fragments of pottery are the most common signs of human occupation on most archæological sites. Their origin can often be deduced from their shapes and fabrics. There are many cases, however, where this evidence alone is ambiguous, and the work described herewith was undertaken to investigate the possibility of identifying the origin from the concentrations of various minor or trace constituents. Such variations of composition of the ceramic body would tend to reflect the variations in the clay from which it was made[1].

A large number of Romano-British mortaria were analysed spectrographically. This type of pottery is particularly well suited to the purpose as it is very often stamped with a potter's name or mark, and therefore its place of origin can frequently be deduced from the distribution of the stamps. The rim shapes and the fabric also tend to follow regional traditions and provide additional evidence. The mortaria chosen for reference standards were either from kiln sites or were those the origin of which could be deduced from archæological evidence.

The spectra were photographed in a Hilger large quartz spectrograph. 5 ± 0·05 mgm. of a 1 : 1 : 1 mixture of sample/graphite/ammonium sulphate containing 1·5 per cent lithium carbonate were arced at 8–9 amp. for 30 sec. in shallow graphite cups against a flat cathode. The arc gap was kept at 4 mm.; a 3-mm. diaphragm 2·5 cm. from it helped to reduce the background. The dilution of the sample was found to improve the burning properties of these refractory materials and to reduce matrix effects[2–4]. The lithium was also useful as an internal standard in some of the experiments.

Considerable systematic regional variations in the concentrations of calcium, sodium, titanium, magnesium and manganese were observed by visual comparison with the spectra of series of mixtures of oxides of 50 elements in an ammonium sulphate base arced under similar conditions. The variations in iron, copper, zirconium, vanadium, chromium and nickel content were either small or masked by the random fluctuations from sample to sample. By means of British chemical standard samples of silica brick and firebrick, calibration curves were set up for the first group of elements. To check the internal consistency of the method in the case of manganese, calcium, and titanium, calibration curves for two lines of different intensities were used. The concentrations of the chosen elements in typical samples were averaged for each kiln area and the results are shown in Table 1. Another 80–100 samples of less certain attribution on archæological grounds were then similarly analysed and the results compared with those in Table 1. In most cases the two kinds of evidence taken together have made the kiln area virtually certain. The details of this work will be published elsewhere, together with results for further kiln-site material as they become available.

From the results it seems that the number of elements for which the quantitative analyses were carried out is sufficient to differentiate between material from well-separated regions. The differences of concentration of the various elements from region to region, when taken together, should leave little ambiguity about the source of the material when deciding between a limited number of archæological alternatives. The decision is made easier in some cases: for example, the compositions of the samples from Lincoln show high titanium, and from Colchester high calcium.

The results for some colour-coated wares, selected by Mr. G. Webster (Table 2), also show significant trends. It is impossible to determine the origin of much of this pottery on purely archæological grounds, and it is for this kind of problem that the spectrographic method may become useful. The colour-coated samples have also been analysed for potassium, gallium, strontium, barium and lead by a different technique, and the results obtained so far suggest that these data will add further criteria of the origin.

Neutron Activation Analysis of Ancient Roman Potsherds

THIRTY-TWO fragments of Roman samian ware have been analysed for their sodium and manganese content, using neutron activation and γ-ray spectrometry. They were chosen from at least 10 of about 30 factories at which this fine-grained pinkish-red Roman table-ware was manufactured. The body of the sherds from all factories is very similar in appearance and a chemical method was sought to differentiate between factories. Similar analyses on other types of pottery have been done by Sayre *et al.*[1,2] at Brookhaven National Laboratory, who found quantitative chemical differences in material from different places. Our results, summarized in Table 1, for 10 or more of the factories, show that this also holds in general for samian ware.

Table 1

Region	No. of factories	No. of sherds analysed	Manganese Average content*	Manganese Standard deviation	Sodium Average content*	Sodium Standard deviation
1. Italy	?	3	8	0·5	2·2	0·25
2. North-east Gaul (east of Moselle valley)	8	9	4	0 45	1·6	0·2
2 (*a*). Chémery, north-east Gaul (east of Moselle valley)	1	3	2	0·2	2·4	0·1
3. Central-south Gaul	3	11	3	0 15	0 7	0·15
4. North-east Gaul (west of Moselle valley)	2	6	3	0 1	0·6	0 1

* In arbitrary units.

50-mgm. samples from the interior of the sherds were irradiated together (so that results for different sherds would be comparable) for 4 hr. in a flux of $1 \cdot 1 \times 10^{12}$ neutrons/cm.^{2}/sec. in *Bepo* at Harwell. The quantities of the elements present were measured in terms of the intensity of the 0·84 MeV. manganese-56 γ-ray and the 2·76 sodium-24 γ-ray, and as no standards were used the results are in arbitrary units. The reactions considered were the thermal neutron reactions manganese-55 (n,γ) manganese-56 and sodium-23 (n,γ) sodium-24, any contribution to the total sodium-24 activity from the fast neutron reaction aluminium-27 (n,α) sodium-24 on aluminium in the sherds being negligible.

Sherds tended to group regionally, and one factory at Chémery in north-east Gaul (east of the Moselle valley) was distinct from the other three in the region. That manufactured close at hand and to the west of this valley is also distinct (group 4), but on the other hand, does not differ significantly from that made in south and central Gaul. Whatever the reason for these differences they are of archæological interest, and suggest a means for locating the region of origin of samian sherds which cannot be placed stylistically.

We gratefully acknowledge the help of Mrs. E. Heckmann, who initiated the work and developed the gamma-ray spectrometer used.

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, January 18

Royal Geographical Society (at 1 Kensington Gore, London, S W.7), at 5 p.m.—Mr. Peter Haggett: "Landuse in the Serra do Mar, Brazil".

University of London (in the Meyerstein Lecture Theatre, Westminster Medical School, Horseferry Road, London, S.W.1), at 5.15 p.m.—Prof. V. M. Trikojus (University of Melbourne): "Some Aspects of Thyroid Biochemistry".*

British Society for the Philosophy of Science (in the Eugenics Theatre, University College, Gower Street, London, W.C.1), at 5.30 p.m—Prof. K. R Popper "An Indeterminist's View of the Physical World" (Presidential Address).

Society of Chemical Industry, Pesticides Group (at 14 Belgrave Square, London, S W.1), at 5 30 p.m.—Dr. L. Crombie: "Lipid *Iso*butylamides".

Royal Institute of Chemistry (at Enfield Technical College, Queensway, Ponders End, Enfield, Middlesex), at 7.30 p.m.—Dr D K. Hill. "Recent Advances in Glass Technology".

Monday, January 18—Friday, January 22

Physical Society (at the Royal Horticultural Society's Halls, Westminster, London, S.W.1)—44th Exhibition of Scientific Instruments and Apparatus.

Tuesday, January 19

University College (in the Anatomy Theatre, Gower Street, London, W.C.1), at 1.15 p.m.—Dr. A. Comfort: "Darwin and Freud".*

Institution of Electrical Engineers, Measurement and Control Section (at Savoy Place, London, W C.2), at 5.30 p m.—Discussion on "Superseding the Ratio Arms in A.C. Bridges", opened by Mr. C. G. Mayo.

University College (in the Physics Theatre, Gower Street, London, W.C 1), at 5.30 p m.—Prof. Alonzo Church (Princeton University): "Logic and Meaning".* (First of four Shearman Memorial Lectures. Further Lectures on January 21, 26 and 28.)

Plastics Institute (at the Wellcome Building, 183–193 Euston Road, London, N.W.1) at 6.30 p.m.—Dr. G. Swift: "Plastics in the Packaging Industry".

Royal Aeronautical Society (at 4 Hamilton Place, London, W.1), at 7 p.m.—Dr. J. Seddon: "Some Aerodynamic Problems of Engine Installation".

Pharmaceutical Society of Great Britain (at 17 Bloomsbury Square, London, W.C.1), at 7.30 p.m.—Dr N. J. Harper. "A Three Dimensional Approach to Drug Design".

Wednesday, January 20

Physical Society, Acoustics Group (in the Physics Department, Imperial College, Imperial Institute Road, London, S.W.7), at 2.30 p.m.—Symposium on "Vibrations".

Royal Meteorological Society (at 49 Cromwell Road, London, S.W.7), at 5 p m.—Monsieur N. Gerbier (Paris): "Experimental Studies of Wave-form Clouds"; Dr. E. Palm (Oslo): "Recent Developments in Theoretical Treatment of Mountain Waves".

Royal Statistical Society (at the London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, London, W.C.1), at 5.15 p.m.—Mr. K. F. Glover: "Statistics of the Transport of Goods by Road".

Eugenics Society (at the Royal Society, Burlington House, Piccadilly, London, W.1), at 5.30 p.m—Mr. Robert H. S. Robertson: "The Output of Scientists in Scotland—1600 to 1950".

Institute of Physics (at 47 Belgrave Square, London, S.W.1), at 6 p.m.—Mr. H. J. Dunster: "Health Physics".

Institution of Electrical Engineers, Education Discussion Circle (at Savoy Place, London, W.C.2), at 6 p m.—Discussion on "One Approach to Generalized Machine Analysis", opened by Mr. G. J. Henderson.

Royal Institute of Chemistry (joint meeting with the British Society for the History of Science, at the Science Museum, Exhibition Road, South Kensington, London, S.W.7), at 6.30 p.m.—Mr F. Greenaway: "Thirty Centuries of Assaying".

Oil and Colour Chemists' Association, London Section (at the Royal Society of Tropical Medicine and Hygiene, Manson House, 26 Portland Place, London, W.1), at 7 p m.—Mr. G. L. Cooper: "An Appreciation of Work Study", followed by a film "Introducing Work Study".

Society for Analytical Chemistry, Biological Methods Group (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 7 p.m.—Prof. L. Garrod: "Antibiotic Assays in Body Fluids".

Society for Psychical Research (at Kensington Town Hall, Kensington High Street, London, W.8), at 7 p.m. Dr. S. G. Soal: "The Jones Boys Experiments—The Case Against Cheating".

Wednesday, January 20—Thursday, January 21

Institution of Electrical Engineers, Measurement and Control Section (in co-operation with the British Computer Society, at Savoy Place, London, W.C.2)—Discussion Meetings on "Reliability and Maintenance of Digital Computer Systems—Managerial and Engineering Aspects".

Thursday, January 21

Institution of Mining and Metallurgy (at the Geological Society, Burlington House, Piccadilly, London, W.1), at 5 p.m—Mr. J. H. Harris "Serial Gravity Concentration—a New Tool in Mineral Processing"; Mr. P. D. R. Maltby "Use of Moving Bed Ion Exchange in the Recovery of Uranium at Can-Met Explorations, Ltd., Blind River, Ontario".

London Mathematical Society (at the Royal Astronomical Society, Burlington House, Piccadilly, London, W.1), at 5 p.m—Dr. S. J. Taylor: "Properties of the Pólya Random Walk".

Institute of Information Scientists (at Caxton Hall, Caxton Street, London, S.W.1), at 6 p.m.—Mr. R. L. Brown: "The Critical Technical Review and Its Contribution to Progress".

Institution of Mechanical Engineers, Hydraulics Group (at 1 Birdcage Walk, Westminster, London, S.W.1), at 6 p.m.—Discussion on "The Value of Hydraulics Research in Mechanical Engineering"

Society of Chemical Industry, Road and Building Materials Group (at 14 Belgrave Square, London, S.W.1), at 6 p.m.—Mr. D. B. Honeyborne "Plastics for Building".

Royal Society of Tropical Medicine and Hygiene (at Manson House, 26 Portland Place, London, W 1), at 7.30 p.m.—Symposium on "Arthropod-borne Diseases"; Dr. C. E. Gordon Smith: "Factors in the Past and Future Evolution of the Arboviruses"; Mr. P. F. Mattingly. "Ecological Aspects of the Evolution of Mosquito-borne Virus Diseases"; Prof. C. D. Darlington "Origin and Evolution of Viruses".

Saturday, January 23

Biochemical Society (in the Department of Biochemistry, London Hospital Medical College, Turner Street, London, E.1), at 10 a.m—390th Meeting

London County Council (at the Horniman Museum, London Road, Forest Hill, London, S.E 23), at 3.30 p.m.—Mr. Philip Sumner: "The Wheel in the History of Transport".*

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Assistant Lecturer in the Department of Sociology—The Registrar, The University, Leicester (January 30).

Chief Cataloguer (graduate with good cataloguing experience, preferably of the Library of Congress scheme)—The Registrar, The University, Nottingham (January 30).

Lecturer (honours graduate in physics or chemistry) in Polymer Chemistry in the Department of Textile Chemistry—The Registrar, The Manchester College of Science and Technology, Manchester 1 (January 30).

Lecturer in Physics and/or Chemistry—The Principal, Borough Road College, Isleworth, Middlesex (January 30).

Research Assistant in the Department of Pure Mathematics—The Registrar, The University, Liverpool, quoting Ref CV/T (January 30)
